## BIOGRAPHY.

*The names of those living at the time of the continuous publication of the 'English Cyclopædia of Biography,' are preceded by an asterisk.*

### RABELAIS, FRANÇOIS.

**RABELAIS, FRANÇOIS**, was born in 1483, at Chinon in Touraine, of humble parents. He entered the order of St. Francis, but his jovial temper and satirical humour made him obnoxious to his brother monks, and he was glad to obtain permission to remove into a convent of Benedictines. But here also he could not sympathise with the habits of his brethren, and at last he ran away from his convent, and went to Montpellier, where he studied medicine and took his doctor's degree. He practised as a physician, though he retained the garb of a secular priest; and in his capacity of physician he became known at the court of Francis I. In 1536 he accompanied Cardinal du Belloy to Rome, and obtained the pope's absolution for the breach of his monastic vows. On his return to France he obtained a prebend in a collegiate church, and was afterwards appointed curé or rector of Meudon, in which situation he continued till his death in 1553.

Rabelais was a man of extensive and varied information; he was acquainted with the principal European languages, besides Latin and Greek, but his principal merit consists in overflowing humour, and in the acuteness with which he caught at and exposed the absurdities and the vices of his contemporaries, sheltered as they were by hallowed prejudice or by the cloak of superstition and hypocrisy. His principal work is a satirical novel, in which, under an allegorical veil, he lashes all classes of society, kings, statesmen, scholars, clerical as well as lay, prelates and popes, and especially monks, of whom he seems to have had a special dislike. Rabelais took for his first hero Gargantua, a gigantic personage, about whom there were many wonderful traditional stories, to which Rabelais added many more. Gargantua lived for several centuries, and at last begot a son, Pantagruel, who is as wonderful as himself; beneath his tongue a whole army takes shelter from rain; in his mouth and throat are cities which contain an immense population, &c. The adventures of these personages are all ridiculous, and are described in humorous language, which often descends to low buffoonery and very frequently to obscenity. This obscenity was according to the taste of the age, but it now is, in its loathsome excess, the chief drawback to the reading of the book. But under this coarse covering there lies a moral, for Rabelais meant to correct and improve society by his satire. He exposes the faults of the education of his time, the barbarous eloquence of college pedants, the folly of scholastic disputation, and the pretensions of self-styled philosophers; all which are successively held up to ridicule in the harangue of Janotus de Braginarde, in which he demands back the bells of the cathedral of Notre Dame, which Gargantua had detached from the belfry and appended to the neck of his mare; in the curious catalogue of the books of the library of St. Victor; in the disputation carried on by signs between Panurge and the English Thaumaste; and, lastly, in the description of the prodigies which science had produced in the country of Quint-Essence, or kingdom of Entéléchie. In another part of his work the author exposes the manners of courts and the weakness even of good monarchs. Pantagruel is a virtuous prince, devout, and severe in his morals, and yet he takes for his favourite Panurge, an arrant rogue, a drunkard, a coward, and a libertine, who seems to be a counterpart of the Margutte of Pulci's 'Morgante Magiore,' for Rabelais was acquainted with the Italian romance writers, whose tales of giants and heroes and their wonderful achievements he probably had in view in his caricatures. The disastrous wars of Charles VIII. and Francis I. had produced too many evils in his time not to attract Rabelais' censure. To the headlong ambition of those conquerors he opposes the prudence and moderation of his heroes,

### RABENER, GOTTLIEB WILHELM.

who, before they enter upon even a defensive war, exhaust every means of conciliation. Rabelais sneers openly at the pretensions of the popes to interfere in temporal matters, and in his fourth book he exposes the pretended mortifications of a certain class of devotees who feasted on meagre days on a variety of dishes of the finest fish and other savoury things.

It has been assumed by some that Rabelais' work is a continued allegory of the events and personages of his time; and people have fancied that they recognised Francis I. in Gargantua, Henri II. in Pantagruel, Louis XII. in Grand Gousier, &c. This however seems very doubtful, and the notion has been strongly combated by Ch. Nodier, in an article 'De quelques livres satiriques et de leur clef,' Paris, 1834. It seems more likely that Rabelais made occasional allusions to some of the leading characters of his age and their prevailing faults, while he lashed in general the vices and follies of society. With regard to the traditional stories of Gargantua, which he took for his subject, see 'Notice de deux anciens Romans, intitulés les Chroniques de Gargantua, où l'on examine les rapports qui existent entre ces deux ouvrages et le Gargantua de Rabelais, et si la première de ces Chroniques n'est pas aussi de l'auteur de Pantagruel,' by J. Ch. Brunet, author of the 'Nouvelles Recherches Bibliographiques,' Paris, 1824.

The romance of Rabelais has gone through several editions, and has been translated into German and English. One of the best French editions is that by Duchat, 'Œuvres de Maître François Rabelais, avec des remarques historiques et critiques,' 3 vols. 4to, Amsterdam, 1741. An excellent recent French edition of the works of Rabelais is that published by E. Johanneau and Esmangart, with a biography of the author, and his 'Songes drolatiques,' being a collection of one hundred and twenty caricatures, designed by Rabelais himself, and intended to represent the characters of his romance, and also his 'Sciomachie,' a work which had become extremely scarce. Swift, in his 'Gulliver's Travels,' has imitated Rabelais. Rabelais was charged in his lifetime with irreligion and heresy, but he was protected by Francis I., who, having read his romance, said that he found no grounds for the charge. Rabelais knew Calvin, who at one time thought of numbering him among his followers, but there was too much dissimilarity between the two men to allow any such connection, and Calvin having gravely censured Rabelais for his profane jesting, the satirist took his revenge by placing in the mouth of Panurge, while buying a sheep of Dindenaut, some of the theological expressions of his austere monitor.

**RABENER, GOTTLIEB WILHELM**, born in 1714 at Wachau near Leipzig, was educated in the public school at Meissen. In 1734 he went to the University of Leipzig to study the law, where he became acquainted with some of the most eminent men of the age, and formed an intimate friendship with Gellert, with whom he took an active part in the establishment of a celebrated literary periodical called 'Bremer Beiträge.' In 1741 he received an office in the board of taxes for the circle of Dresden, and in 1763 he was appointed counsellor of the court of aids (Steuerrath), which office he held until his death, on the 26th of March 1771. Rabener was in his time one of the most popular writers in Germany, and he exercised a very beneficial influence upon his countrymen. His satires, in which he attacked in a good-humoured strain the most glaring follies, fashions, and pretensions of his time, though not marked by much depth of thought, are still instructive and amusing as historical pictures of the age in which he lived, for the things which he ridiculed have long ceased to exist.

His satires, which with one exception are written in prose, show great power of observation, and a cheerful disposition combined with a considerable share of wit; the style is easy and attractive, though sometimes rather prolix. They were first published in several periodicals, but collected in 1751 at Leipzig in 2 vols.; in 1752 another, and in 1755 a fourth volume was added. A complete edition, with a life of the author, was published in 1777 in 6 vols.

RACINE, JEAN, was born towards the end of 1639 at Ferté Milon, in the present department of Aisne, France. He was the son of an officer of the excise, but lost both his parents while he was a child. He studied first at Beauvais, and afterwards in the celebrated school of Port Royal des Champs, under Lemaître, Lancelot, and the Abbé Hanon. He applied himself especially to the study of the Greek poets. After three years spent at Port Royal he went to finish his education at Paris, in the Collège d'Harcourt, in 1658. He had long shown a decided inclination for poetry, and on the occasion of the marriage of Louis XIV. in 1660 he entered the lists with various other poets who wrote in honour of that event; and his composition, 'La Nymphe de la Seine,' being considered as the best, was noticed by the king, who sent to the young poet, through Colbert, a present of 100 louis-d'or. In 1664 Racine brought out his first tragedy, 'La Thébaïde, ou les Frères ennemis,' a subject which was suggested to him by Molière. He next wrote his 'Alexandre,' which is a feeble composition. Corneille, who was then grown old, advised Racine to give up writing tragedy. Boileau, on the contrary, encouraged him; and Racine, having studied hard for some years to improve himself, produced in 1667 his 'Andromaque,' which was acted with great applause. In the next year he wrote 'Les Plaideurs,' a humorous comedy in imitation of the 'Wasps' of Aristophanes, which was so much relished by Louis XIV. that he bestowed upon the author a pension, accompanied by a very flattering letter. Racine now produced in succession 'Britannicus,' 'Bérénice,' 'Bajazet,' 'Mithridate,' 'Iphigénie,' and 'Phèdre,' which last is often considered his masterpiece; but when 'Phèdre' was first brought on the stage in 1677, a rival coterie intrigued against him, and succeeded in running down the work, which so disgusted Racine that he resolved to write no more plays. About that time he married the daughter of the treasurer of Amiens, a match which proved a happy one.

Racine frequented the court, where he had a warm friend in Madame de Maintenon, and he was appointed by Louis XIV. historiographer of the kingdom, together with Boileau. Of his historical labours however only a few fragments remain. Several years after, at the entreaty of Madame de Maintenon, he wrote another drama, 'Esther,' which was acted in the house of education of St. Cyr in 1689, and was well received. In the following year he wrote 'Athalie,' which was performed in the same place, and was afterwards published; but it was received very coldly, although it has since been acknowledged to be Racine's noblest composition. This was also Boileau's opinion at the time, who told him so, adding that the judgment of the public would right itself in time—a prediction however which was not accomplished till long after Racine's death.

'Athalie' was the last play of Racine. He continued to visit Madame de Maintenon, to whom he used to read parts of his projected history of Louis XIV. As he came to advert to the system of administration, he could not help reflecting upon the wanton prodigality of expenditure, the enormous burden of taxation, the disastrous wars caused by mere ambition, and the consequent distress of the country, and the misery of a great part of the population. Racine was a man of honest feelings; he became animated with his subject; and Madame de Maintenon was evidently affected by his picture. She suggested to him to draw up a memoir of what he thought could be done in the way of alleviating the distress of the people. Racine complied, and delivered his memoir to Madame for her perusal. As she was reading it one day in her cabinet, Louis XIV. entered, and she could not conceal from him the paper nor the author of it. Louis, having glanced at the memoir, observed with a frown that, "as M. Racine could make excellent verses, he fancied that he knew everything; as if, because he was a great poet, he ought to be also a minister of state." Racine was informed of this, and from that time he was banished from the court. He had been for some years in a declining state of health, under the influence of mental excitement and of melancholy, and the mortification which he now felt embittered his sufferings. His complaint, which was an abscess in the liver, was badly treated by the physicians, and he sank rapidly. Louis XIV., being informed of his danger, showed great interest in his fate, and sent to inquire after him; indeed, the whole court sympathised with the dying poet. At last an operation was performed; but three days after Racine expired, in the midst of acute pain, on the 21st of April 1697, in his fifty-ninth year. He was interred, according to his request, in the abbey of Port Royal des Champs, a spot for which he had always retained a great affection. After the destruction of that monastery in 1709, the remains of Racine were transferred to Paris, and deposited in the church of St. Etienne du Mont, by the side of those of Pascal. Louis XIV. bestowed upon his widow a pension of 2000 livres, and the reversion of it on her sons till the death of the youngest.

The plays of Racine have gone through many editions; one of the best is that of 1768, 'Œuvres de Jean Racine, avec des Commentaires par Luncieu de Boisjermain,' 6 vols. 8vo. It also contains his 'History

of Port Royal,' the 'Fragmens Historiques,' several discourses delivered in the French Academy, of which he was a member, and other small compositions, with a biography of Racine.

His son, LOUIS RACINE, published memoirs of his father's life, two volumes of commentaries on his plays, and a poem, 'La Religion,' in six cantos.

Racine adhered strictly to what are called the classical unities, and his subjects were chiefly taken from ancient history; but his personages, though Greek or Roman by name, are French in their character. His great merit lay in his delineation of the passions, his exquisite pathos, and the harmony of his verse. By common consent he stands at the head of French dramatists of the classic school.

RACZYNSKI, EDUARD, a Polish nobleman of literary tastes and talents, was born at Posen in 1786, the son of Count Philip Raczyński, a Polish general. Count Eduard entered the Polish army, and took some share in Napoleon's campaign of 1807; but on the fall of Napoleon I., when he became a simple Prussian subject, he withdrew from a military career. He travelled in Turkey in 1814, and published an account of his journey in one of the most splendid volumes in the Polish language, 'Dziennik Podróży do Turcyi' (folio, Breslau, 1821, illustrated with numerous plates). The rest of his life was chiefly devoted to literary pursuits. His 'Obraz Polakow i Polski' ('Picture of the Poles and Poland in the 18th Century,' 21 vols., Breslau, 1840, &c.), is a valuable collection of memoirs, most of them before unpublished. Another of his most prominent works is his 'Gabinet medalow Polskich,' or 'Cabinet of Polish Medals,' in 4 vols. 4to (Berlin and Posen, 1841-45), with a text in Polish and French. His 'Wspomnienia Wielkopolski' ('Memorials of Great Poland,' 2 vols., with an atlas of plates), is also deserving of mention. The 'Codex Diplomaticus Majoris Poloniae,' or collection of documents illustrating the history of Poland, which he edited, had been originally compiled by his grandfather, Count Kazimierz Raczyński; but a companion work, the 'Codex Diplomaticus Lithuaniae,' was his own. Among other benefactions to Posen, he founded a public library in that town, erecting a building for the purpose, presenting to it a collection of 21,000 volumes, and endowing it with a fund for the maintenance of the librarian, who is at present Lukaszewicz, one of the first historians and antiquaries in Poland, to whom the count gave the appointment. On the 20th of January 1845 Raczyński destroyed himself, by means of an ornamental cannon which was kept in his park. It was currently reported that the motive of the act was, that in looking over some old family papers, he had found that one of his ancestors had received part of the family estates as a bribe from Catharine II. of Russia to betray the cause of his country. The lady of Count Raczyński, who survived him, was the widow of Count Jan Potocki, also a Polish author of eminence, who destroyed himself thirty years before in 1815. His son, Count Roger Raczyński, who succeeded him, generously abolished the feudal dues that were payable to him by 4000 peasants of the twenty-seven villages on the estates of the family.

\*RACZYNSKI, ATHANASIUS, the younger brother of Count Eduard, born on the 2nd of May 1788, entered the Prussian diplomatic service, was in 1840 the Prussian ambassador at Copenhagen, and afterwards at Lisbon and Madrid, but quitted the latter post in 1853, and has since lived in retirement. His literary works have been chiefly on subjects of art, and written in the French language. His account of modern art in Germany ('Histoire de l'Art Moderne en Allemagne,' 3 vols. 4to, with atlas, Paris, 1836-42), though not a work of much depth, is the most convenient general view of the subject that has yet appeared. The same praise may be given to his 'Arts in Portugal,' and 'Historico-artistical Dictionary of Portugal,' both in French, published at Paris in 1846 and 1847.

RADCLIFFE, JOHN, M.D., was born in 1650, of a good family at Wakefield in Yorkshire. From the grammar-school of his native town he passed to University College, Oxford, at the age of fifteen. He took his degree of B.A. in 1691, and became senior scholar of his college, but, as no fellowship became vacant there, he accepted a fellowship at Lincoln College. He took his degree of M.A. in 1672, and commenced the study of physic, which he pursued in no other medical school, but attended the different courses of anatomy, chemistry, and botany delivered in the University. He is represented by his biographers as having "recommended himself more by ready wit and vivacity than by any extraordinary acquisitions in learning," being visited in his rooms by Dr. Bathurst, the president of Trinity College, and asked by him where was his library, he is said to have pointed to a few vials, a skeleton, and a herbal in one corner of his room, and exclaimed with emphasis, "There, sir, is Radcliffe's library." In 1675 he took his degree of M.B., and began to practise as a licentiate in Oxford, where by some happy cures he soon acquired a great reputation. In 1677 he relinquished his fellowship in accordance with the statutes of his college, which require all the fellows after a certain time to enter into holy orders. He wished however to keep his rooms in college, and to reside there as a commoner, but this Dr. Marshall, the Rector (whom he is supposed to have offended by some witticisms), refused to allow, which so much disgusted him that in after-life he lavished the whole of his munificence on his former college, University, leaving to Lincoln only the second presentation to a living if no fellow of University chose to accept it. In 1682 he took the degree of M.D., and went out a Grand Compounder. At length, in 1684, he removed

to the metropolis, and settled in Bow-street, Covent-Garden, where in less than a year he got into great practice, to which perhaps his pleasantries and ready wit contributed as much as his reputed skill in his profession. He was now in the high road to wealth and reputation, and he arrived at both, though his success is said to have been due rather to his manners than to his ability. On the other hand we have the testimony of Dr. Mead, that "he was deservedly at the head of his profession, on account of his great medical penetration and experience."

In 1686 he was appointed by the Princess Anne her principal physician, and from this time till his death he enjoyed the undisputed favour of the court, during the reigns of William and Anne; and although he often offended both the king and queen by his freedoms, yet such was the opinion of his medical skill, that he was always sent for in any case of danger. There are few events in his life that require particular notice, and the greater part of his biographers have only given a collection of anecdotes—which it would be out of place to repeat here—showing at once his wonderful skill in forming a correct prognosis, his rudeness and brutality towards his patients even of the highest rank, and the enormous sums of money which he received as fees. Towards the end of the reign of James, the then celebrated Master of University College, Obadiah Walker, his fellow-collegian, was in vain employed to influence his religious principles. The answer of Radcliffe was firm and dignified: "being bred up a Protestant at Wakefield, and having continued such at Oxford, where he had no relish for absurdities, he saw no reason to change his principles and turn Papist in London." In 1713 he was elected into parliament for the town of Buckingham, but only two of his speeches have been preserved, and it does not appear that he was at all distinguished as a senator. He was sent for to attend Queen Anne when she lay at the point of death, but, being much indisposed himself, and knowing the case to be desperate, he declined coming, for which he was much blamed at the time, and intimation was given him that the populace in London were disposed to tear him in pieces if he should venture to come to town from his country-house. It is probable that the agitation of his mind concurred with a broken constitution in bringing him to an end two months afterwards, November 1, 1714, at the age of sixty-four. His body lay in state at the house at Carshalton, where he died, till November 27, it was then removed to an undertaker's in the Strand, and thence escorted to his favourite city Oxford, where it was interred with great solemnity in St. Mary's church.

It only remains to give a brief account of his posthumous benefactions, which were indeed most munificent, and which well entitle him to hold an eminent place in the long list of benefactors to the University of Oxford. After making a life provision for some of his relations, he bequeathed his whole fortune to public uses. To St. Bartholomew's Hospital in London he gave for ever the yearly sum of 500*l.* towards mending their diet, and a further yearly sum of 100*l.* for buying of linen. He left 40,000*l.* for the building of a library at Oxford, which he endowed with an annual stipend of 150*l.* for the librarian (who is chosen by the same electors that appoint the travelling fellows, to be hereafter mentioned); 100*l.* per annum for repairs, and 100*l.* per annum for the purchase of books and manuscripts relating to the science of physic; comprehending, as that term was then understood, anatomy, botany, surgery, and natural philosophy. [A description of this building is given under OXFORD in GEOG. DIV., vol. iv., col. 31.] To University College he left 5000*l.* to build the master's lodge there, making one side of the eastern quadrangle. He also left them his Yorkshire estate in trust for the foundation of the two Travelling Fellowships to be held by "two persons to be chosen out of the University of Oxford, when they are M.A., and entered on the Physic line." The electors are, the Archbishop of Canterbury, the Lord Chancellor, the Chancellor of the University, the bishops of London and Winchester, the two principal secretaries of state, the two chief justices of the Queen's Bench and Common Pleas, and the Master of the Rolls. The appointment is 300*l.* per annum to each of the fellows, and apartments in University College. They hold their fellowships "for the space of ten years, and no longer, the [first] half of which time, at least, they are to travel in parts beyond sea for their better improvement." He also bequeathed the perpetual advowson of the rectory of Headbourne Worthy, in Hampshire, to trustees for the benefit of University College for ever, so that a member of that society should always be presented to it on every vacancy. He gave to the same college during his life 1100*l.* for increasing their exhibitions and for general repairs, and the painted window at the east end of their chapel appears from the inscription under it to be his gift. After the payment of the bequests above mentioned, he gave to his executors, in trust, all his estates in Buckinghamshire, Yorkshire, Northamptonshire, and Surrey, to be applied in such charitable purposes as they all, in their discretion, should think best; but no part thereof to their own use or benefit. Out of these funds were built the Infirmary (1770) and the Observatory (1772) at Oxford, and the Lunatic Asylum on Heddington Hill near that city also received in 1827 so much assistance from the same source, that the committee gave it the name of the "Radcliffe Asylum;" and the trustees have ever been found ready to contribute according to their means to every charitable and useful purpose.

RADEMACKER, GERARD, was born at Amsterdam in 1673. His father, an architect, much esteemed by Lairese and other artists,

instructed him in drawing and perspective, and would have brought him up to his own profession, but perceiving his predilection for painting, he placed him under A. van Goor, a respectable portrait-painter. Gerard applied himself to his studies with unremitting perseverance so long as his master lived; and at his death, being sufficiently advanced to give lessons in design, he was engaged by the Bishop of Sebaste to teach his niece drawing. His agreeable manner gained the favour of the bishop, who, being soon afterwards obliged to go to Rome, invited Rademacker to accompany him; he spent three years at Rome, where he greatly improved himself. He was fond of representing views of the principal ruins and ancient monuments, which he designed with accuracy and spirit. On his return to Holland his success produced him numerous friends and abundance of employment. He did not however confine himself to architectural subjects, but painted many historical and emblematical pieces. His fertile invention and facility of execution enabled him to paint many pictures in a short time. He is reckoned one of the best masters of the Dutch school for a certain grandeur of style, which had been cultivated by the study of the best models. He died at Amsterdam in 1711.

RADEMACKER, ABRAHAM, supposed to be a younger brother of GERARD RADEMACKER, was born at Amsterdam in 1675, and attained a high rank as a landscape-painter. At first he drew in Indian ink, in which style he acquired great perfection. He then practised in water-colours; and he subsequently painted with equal success in oil-colour. His invention was fertile; he composed readily and agreeably, and embellished his landscapes with picturesque ruins and buildings, and with well-designed groups of figures and animals. He engraved in a masterly manner a set of nearly 300 plates, from his own designs, of the most interesting views of ancient monuments in Holland and the Austrian Netherlands; they were published at Amsterdam in 1731. He died in 1735.

\* RADETZKY DE RADETZ, FIELD-MARSHAL, COUNT JOSEPH, was born at the castle of Trebnice, in the Klattauer district, in Bohemia, on the 2nd of November 1766. He was the son of Count Peter Eusebius Radetzky, and of the Baroness Maria Bechyne. The family name was formerly spelt Hradecky. Having entered the army as cornet, in the 2nd Austrian Cuirassiers, in 1784, he became sub-lieutenant, February 3, 1787. In 1788 he served in the Turkish campaign under Marshal Lacy, and was raised to the rank of first lieutenant for his services at the siege of Belgrade. When the Austrian army entered France in 1793, Radetzky, then a captain, was sent to the new scene of war; and he was present in all the Italian campaigns from 1795 to 1800, serving alternately under Beaulieu, Wurmser, Alvinzi and Melas, and distinguishing himself greatly at the battles of Arcola, Rivoli, and Marengo. Meanwhile, in 1797, he was promoted to the rank of major, and in 1799 he became adjutant-general to Melas, who soon learned to appreciate his zeal and gallantry, and repeatedly mentioned his name in his despatches. For his gallant behaviour at the battles of Novi (May 15, 1799) and Marengo (June 14, 1800), he was created colonel, and appointed to command the Archduke Albert's cuirassiers, and received the order of Maria Theresa.

From the peace of Luneville in 1801, to 1805, Colonel Radetzky was not employed in the field; but at the latter period he was made major-general. During the contest at Aspern, May 21-22, 1809, when the place was six times retaken by the Austrians from the French, few officers contributed so much to the victory as Radetzky. On the 1st of June he received the command of the 4th corps, with the rank of lieutenant-field-marshal. At the battle of Wagram, July 6, 1809, he commanded the Austrian cavalry. In April 1810 he was nominated commander of the military order of Maria Theresa. From that period until the end of 1812 his services were employed at home in the war-office.

During the whole campaign of 1813, when the tide of war had turned against Napoleon I., Lieutenant-Field-Marshal Radetzky acted as chief of the staff to Prince Schwartzberg; and the Austrian commander attributed the victory of Kulm mainly to Radetzky's skill and gallantry. But his crowning feat of arms was at the battle of Leipzig, October 18, 1813, the plan of which he drew up. As is well known this decisive action was a succession of battles which lasted three days. The Emperor of Russia and the King of Prussia were present, and 1600 pieces of artillery thundered over the field. Although he had then been nearly thirty years in the service, Radetzky received his first wound at Leipzig. Throughout the campaign of 1814 within the French territory he was continually in action, and on the 31st of March he entered Paris, riding by the side of the Emperor Alexander. Radetzky was appointed in 1822 Commander-General of the Lombardo-Venetian kingdom; and in 1830, in his sixty-fourth year, after forty-six years of service, he was created field-marshal.

But it was the Italian insurrection, in 1848, which first gave prominence to the name of Radetzky. As early as the year 1846, manifest signs of a turbulent spirit were visible in Italy. The stringent rule of the Austrian government had long excited a rancorous feeling against their foreign masters, and the Italians panted for an opportunity to reject the yoke. The reforms of Pope Pius IX., served only to promote the smouldering irritation. Societies were formed to diffuse the secret spirit of revolt throughout the entire peninsula. In 1847,

the movement was all but brought to a crisis, when Austria claimed and enforced the right to place a garrison in Ferrara. Immediately a Civic or National Guard was constituted in every Italian state. Then came the revolution in Paris, in February 1848, followed by similar movements in Vienna and Berlin, which raised the spirit of insurrection to its height.

On the 18th of March 1848, barricades were erected in every street in Milan; the fighting lasted for three days; after which Marshal Radetzky drew his troops out of that city, and retreated to Verona. The Austrian army, at that time in Italy, amounted to nearly 75,000 men; but it was scattered over an extensive line of operations. Consequently the insurgents were at first triumphant; the tricolor flag appeared upon all the towers of Italy, except those of Verona, Mantua, Legnano, and Peschiera; and Charles Albert, king of Sardinia, having united himself to the league, a most gallant contest was maintained for five months. More than once the veteran marshal had to quit the field; but every time he retired in good order. At other times victory was on his side. At length, on August 4, 1848, Radetzky, after a series of successful attacks on the Italian posts, advanced against Milan, at the head of the Austrian army; the Milanese lost heart, and deaf to the remonstrances of Charles Albert, urging them to defend the city, they held a council of war, and determined to abandon Milan. A deputation was sent to Marshal Radetzky, and the terms obtained were: "that the Piedmontese army was to be withdrawn in two days from the Lombard territory; that the Austrians were to enter Milan on the 6th of August; and that the lives and property of the people were to be respected." The struggle was now virtually at an end. Radetzky's superior strategy, and the disunion of his opponents rendered it an easy task for him to break up the Sardinian forces, and he was again master of all Lombardy. The Emperor of Austria in return for his services sent him an autograph letter of thanks, accompanied by the first class order of St. George. In March 1849, the rebellion in Hungary incited the Italians to make a new attempt to establish their independence; but it was rendered abortive by the prompt and energetic measures of the marshal. Since then, full of years, and loaded with honours by his sovereign, he several times applied in vain for leave to resign his command. Nor was it until the opening of 1857, that he obtained this permission, in a courteous letter from the emperor, after a prolonged service of seventy-three years in the Austrian armies.

Marshal Radetzky married in 1798 the Countess Frances Strassoldo-Gräfenberg, by whom he has a son and daughter living.

RAEBURN, HENRY, the son of a manufacturer at Stockbridge, near Edinburgh (which now forms part of that city), was born there on the 4th of March 1756. He lost both his father and mother whilst young, and was apprenticed by his elder brother to the business of a goldsmith. During the time of his apprenticeship he painted miniatures, which were executed in such a manner as to attract notice, and soon came to be in general demand. As he was able to complete two of these in a week, his master readily agreed to allow him to withdraw from the trade, receiving as an equivalent part of the young painter's earnings.

Obtaining some of David Martin's pictures to copy, he adopted oil-painting, and after a time wholly abandoned miniatures. At the expiration of his apprenticeship he became a portrait-painter, and gained very extensive practice. In 1779 he married, and some time after came to London, where he was much noticed by Sir Joshua Reynolds, by whose advice he went to Italy, where he remained two years, carefully studying the works of the great masters. In 1787 he returned and established himself in Edinburgh, where in a short time he became the chief portrait-painter. He was elected a member of the Royal Society of that city, of the Imperial Academy of Florence, and of the South Carolina and New York academies. In 1812 he was elected an associate and in 1815 a member of the Royal Academy, London. On the visit of George IV. to Scotland in 1822, Raeburn was knighted at Hopetown House, and in the summer of the following year he was appointed portrait-painter to the king for Scotland, an honour which he did not long enjoy. He died on the 8th of July 1823.

Amongst his chief portraits may be enumerated those of Lord Eldon, Sir Walter Scott, Dugald Stewart, Professor Playfair, James Watt, Francis Jeffrey, Henry Mackenzie, John Rennie, and Sir Francis Chantrey. His style was free and bold, his drawing correct, his colouring rich, deep, and harmonious; and the accessories, whether drapery, furniture, or landscape, appropriate, and though carefully executed, always kept duly subordinate. He had a peculiar power of rendering the head of his figure bold, prominent, and imposing. The strict fidelity of his representations may in a great degree be attributed to his invariable custom of painting, whether the principal figure or the minutest accessory, from the person or the thing itself, never giving a single touch from memory or conjecture. The portraits of Sir Henry Raeburn, with some deficiencies, possess a freedom, a vigour, and a spirit of effect, and convey an impression of grace, life, and reality which may be looked for in vain amidst thousands of pictures, both ancient and modern, of more elaborate execution and of minuter finish.

RAFFAELLE, RAFAEL, RAFFAELLO, or RAPHAEL, SANZIO, was born at Urbino, on the 6th of April 1483, and not on Good Friday

(March 23) of that year, as Vasari erroneously fancied. He was the son of Giovanni de' Santi, a painter of merit in that city, some of whose works still exist; a specimen of them may be seen in the Berlin Gallery (No. 215, first division), bearing the name of Giovanni, and showing considerable beauty, but with weak colouring. Although Raffaele lost his parents before he was twelve years old, he imbibed the rudiments of art from his father. Other artists of that peculiar school which fixed itself in Umbria, such as Nicolo Alunno of Foligno, and Andrea Luigi of Assisi, probably exercised some influence over the young painter. At what age he became the pupil of Perugino we know not, but traces of the scholar's hand are supposed to be visible in several of the works of the master; among others in the frescoes of the Cambio at Perugia, which were painted about the year 1500.

The career of Raffaele is usually divided into three periods, of which the first terminates with his visit to Florence, in the autumn of 1504; the second comprises the time from that date until he was invited to Rome by Julius II., about the middle of 1508; and the third extends to his death, in 1520.

1. To begin with the works executed before Raffaele's visit to Florence. One of the earliest of these now extant is probably the 'Virgin with the Book,' in the Berlin Gallery (No. 223, first division), and a still more important picture of this period is the 'Adoration of the Magi,' in the same collection (223 a). The latter is executed on linen, in size colours ('al guazzo'), and was originally intended for the high altar at Ferentillo; it was purchased by the late king of Prussia from the Ancarani family at Spoleto, for the sum of 6000 scudi, and has suffered a good deal from the peeling of some of the colours.

The pictures painted at Citta di Castello were, the 'Coronation of St. Nicholas of Tolentino' (said to have disappeared from the Vatican during the French occupation); the 'Sposalizio, or Marriage of the Virgin' (now in the Brera at Milan), and the 'Christ on the Cross,' in the collection of Cardinal Fesch. Lanzi, on the authority of mere tradition, states that the first of these three was painted when Raffaele was only seventeen, that is, in 1500; and he assigns the last to about the same time: both probably approach very nearly in time to the 'Sposalizio,' which bears the date of 1504. The 'Coronation of the Virgin' (now in the Vatican) clearly shows the struggle of new principles, although Vasari, whose contempt for the simplicity of the earlier style led him to content himself with very general resemblances, refers to this picture as one of those which prove how closely Raffaele imitated the manner of Perugino. Notwithstanding Vasari's assertion to the contrary, it seems probable that both the 'Coronation of the Virgin' and the 'Crucifixion' belonging to Cardinal Fesch were posterior to the 'Sposalizio.'

Raffaele's share in the frescoes executed by Pinturicchio, in the Libreria of the Cathedral at Siena, has been much exaggerated. There is little doubt that he never worked there in person, although he furnished some drawings to his fellow-pupil; two of these are yet extant, one in the Florence Gallery, and the other in the Baldeschi collection at Perugia. Vasari's whole account of Raffaele's first visit to Florence is confused in the highest degree. He describes him as induced to quit Siena by the report of Leonardo's 'Battle of the Standard' and of M. Angelo's Cartoon, although the latter work was not exhibited till 1506, while the frescoes of Pinturicchio were probably completed in 1503, and the date of Raffaele's journey is fixed to October 1504, by the letter of recommendation for the Gonfaloniere Soderini from the Duchess of Sora. Quatremère de Quincy tries to solve the difficulty by assuming a visit to Florence in 1503, and another in the following year, but a strong presumption against this supposition is furnished by the total absence of all trace of Florentine principles in the 'Marriage of the Virgin.' Susceptible of new impressions in art as Raffaele afterwards showed himself, it is impossible that the first introduction to his great Florentine contemporaries should have left no trace in his works. Now the pictures of 1505 exhibit clear traces of a new influence. In fact, at the time of his arrival at Florence, art had just reached the point which enabled him to reap the fullest benefit from the new field thus thrown open. He studied the works of Masaccio, and became the friend of Fra Bartolomeo and Ridolfo Ghirlandaio. In the following year we find him employed again at Perugia. The fresco in San Severo, and the altarpiece for the Ansidei family (now at Blenheim) were painted in 1505. Whether the picture executed for the nuns of St. Antonio of Padua at Perugia, which is at Naples, be of the same or of a later date, is a disputed point.

Four pictures of the 'Virgin and Child' of Raffaele's Florentine period are distinguished by different characters, though all exquisitely beautiful. The 'Madonna del Gran Duca,' in the Pitti Palace, is the most simple, and, to our judgment, the most admirable of them all. It still breathes much of the spirit of the Umbrian school. The other three are the 'Madonna Tempi' at Munich, the 'Colonna Madonna' at Berlin, and the picture in the possession of Lord Cowper at Panshanger. To the same time must be attributed the 'Madonna del Cardellino,' in the tribune at Florence, the 'Belle Jardinière' at Paris, and the 'Holy Family,' with the Palm, in the Bridgewater collection. The first of these three was painted for Lorenzo Nasi. Raffaele's power and fidelity as a portrait-painter are well shown in the beautiful portraits of Angelo and Maddalena Doni, in the Pitti

palace, and in two heads of monks, in the Academia at Florence. The 'St. Catherine,' which passed from the Aldobrandini collection into that of Mr. Beckford, and afterwards into the National Gallery, was executed in the latter part of the artist's residence at Florence. The two works which must be considered as closing this division are the 'Madonna del Baldacchino' or 'di Pescia,' left unfinished when the painter started for Rome, and the 'Entombment of Christ.' The former picture bears some resemblance in its technical details to the works of Fra Bartolomeo: it is now in the Pitti palace. The latter was painted by order of Atalanta Baglioni for S. Francesco at Perugia, and forms part of the Borghese collection. It is an elaborate composition, of the greatest beauty and power of expression, proving how much Raffaele had profited by his Florentine studies.

The invitation given by Julius II. to Raffaele would be sufficiently accounted for by the celebrity of the artist himself, although it is very probable that his connection with the family Della Rovere, or the favour of his fellow-countryman Bramante, facilitated his introduction at the papal court. He seems to have left Florence, rather suddenly, towards the end of the year 1508.

The 'Stanze' decorated by the pencil of Raffaele were the living-rooms of the papal court in the time of Leo X. His frescoes suffered during the occupation of Rome by the imperial troops in 1527, and by subsequent neglect, when the popes had transferred their residence to the Quirinal. In the years 1702 and 1703 they were cleaned and restored by Carlo Maratti, who repainted the larger portion of the decorative framework.

The Camera della Segnatura was the first worked on by Raffaele. The figures of Theology, Poetry, Philosophy, and Justice on the ceiling, preceded in execution the large paintings on the walls. Of these last the 'Disputa del Sacramento,' as it is commonly called, was the earliest. In simple beauty and severe dignity, in energy and individual character, this work has never been surpassed; in technical excellence, and the picturesque qualities of breadth, composition, and softness, it is certainly inferior to the 'Parnassus' and the 'School of Athens,' which came next. The allegorical figures of Temperance, Fortitude, and Prudence, in the semicircular division on the remaining side of the room, are among the most beautiful of Raffaele's designs.

In the Stanza d'Eliodoro, the fresco of 'Heliodorus,' together with that of the 'Mass of Bolsena' and the scripture subjects in the ceiling, were executed in the pontificate of Julius. It is impossible to show more complete understanding of the application of painting to a story than Raffaele has displayed in the first of these compositions. The colouring of the 'Mass of Bolsena' is admirable.

In 1513 Leo X. succeeded to the papal chair. The two remaining frescoes in the Stanza d'Eliodoro, that is to say, 'Attila repelled from Rome' and the 'Liberation of St. Peter,' belong to his reign. The latter is supposed to allude to the pope's escape, when Cardinal de' Medici, after the battle of Ravenna; and the former to the retreat of the French from Italy.

In the third room, or Stanza del Incendio, the ceiling contains some paintings of P. Perugino, which were spared when those of other masters were destroyed to make room for the works of Raffaele. The subjects on the walls are the 'Burning of the Borgo' (or suburb of Rome), the 'Victory over the Saracens at Ostia,' the 'Coronation of Charlemagne,' and the 'Death of Leo III.' The execution of all these was more or less left to pupils; those in the Sala di Costantino were wholly painted by Julio Romano and others, from designs by Raffaele.

The loggie, or open colonnades, designed by Bramante, were decorated under the directions of Raffaele by his principal scholars. The cartoons for the tapestry to be hung round the Sistine Chapel were prepared in 1515 and 1516, at the desire of Leo X. These cartoons were cut into strips for the convenience of the workmen at Arras. By some unaccountable neglect they remained in Flanders, and seven of the ten were, after the expiration of a century, bought by Charles I. at the suggestion of Rubens. When the property of the crown was sold by the Commonwealth they were valued at 300*l.*, and purchased by Cromwell's order at that price for the nation. William III. caused these precious fragments to be properly mounted and put up at Hampton Court. In 1766 they were removed to Buckingham House, thence carried to Windsor, and in 1804 again restored to Hampton Court. The cartoons have far greater pretensions to be considered as original works of Raffaele than the paintings in the two last rooms of the Vatican just referred to. In composition they are unrivalled, and their whole conception is admirably adapted to the purpose which they were meant to fulfil.

The 'Isaiah' in San Agostino was probably painted in 1512 or 1513, and the 'Sibyls' in Santa Maria della Pace shortly afterwards. Rumohr, on technical grounds, places the latter (one of the artist's most admirable works) about 1515. Their subjects and their mode of treatment sufficiently establish in a general sense that imitation of Michel Angelo of which so much has been said.

We must now return to the smaller works of Raffaele.

Vasari says that his portrait of Julius II. was so like as to inspire fear, as if it were alive. The original thus spoken of is supposed to be in the Tribune at Florence. Two copies of it are in the Pitti palace, and one in our own National Gallery. The last came from the Borghese collection. On the subject of Raffaele's own portrait a good deal of

controversy has taken place. It is certainly difficult to detect much resemblance between the portrait in the Florence collection and that purchased by the king of Bavaria from the Altoviti family; and the expression of Vasari, "à Bindo Altoviti fece il ritratto suo," is ambiguous, but nevertheless we believe the picture now at Munich to be the work of Raffaele and his own portrait.

Three portraits exist, which are believed to represent Raffaele's mistress, the so-called Fornarina, painted by himself. One of these is in the Barberini, another in the Sciarra palace (at Rome), and the third is in the Tribune at Florence. This last picture bears the date of 1512, and was at one time attributed to Giorgione. Certain it is that the colour would be worthy of the Venetian master, and that the face and form are Venetian in their character.

The Madonna della Seggiola, the Madonna del Duca di Alba, and several others of somewhat similar feeling belong to the early part of Raffaele's residence at Rome. The Madonna di Foligno, now in the Vatican, was painted for Gismondo Conti, probably about the time of the completion of the Camera della Segnatura. The Vision of Ezekiel is said to have been paid for in 1510; two pictures of the subject exist, one in the Pitti palace, and another, from the Orleans gallery, in the collection of Sir Thomas Baring. It is disputed whether either, and if either, which of these two is the original. The St. Cecilia at Bologna was ordered about 1510, and completed somewhat later; it has suffered greatly from restoration.

The four great altar-pieces of Raffaele's later time are—

1. The Madonna del Pez, painted for San Domenico at Naples, and now (1833) in the Iglesia Vieja of the Escorial. It is a composition of the purest and simplest beauty.
2. The Madonna di Santa Sisto, the well-known pride of the Dresden gallery. It is painted on canvas, and Rumohr conjectures that it was intended for a 'drapelone,' or large standard, to be carried in procession, attached to two poles. A picture, by Guido, painted on grey silk, and called 'il pallione,' from being used in this manner, is to be seen in the Pinacoteca at Bologna (No. 138). The most striking points in the Madonna di Santa Sisto are the deeply meditative anticipation of future suffering in the Virgin, and the superhuman character imparted to the Christ by the union of a childish form with the severe thoughtfulness of maturer age.
3. The Spasimo di Sicilia, executed for Santa Maria dello Spasimo, at Palermo, is now in the public gallery at Madrid. There is something academical in the figure of the executioner, but the deep feeling in the right-hand group of women reminds us of the Borghese entombment. This picture has suffered much by restoration, and has acquired a sort of brickdust colour.
4. The Transfiguration, usually considered to be Raffaele's masterpiece. It was left unfinished at his death.

Besides the above-named works, we must allude to the Visitation and the Perla, both in the sacristy of the Escorial. The latter formed part of the collection of Charles I. of England.

The Archangel Michael, and the Holy Family, painted in 1518, for Francis I., are first-rate pictures of the artist's later time. In the portrait of Leo X., with the Cardinals de' Medici and Rossi (painted not earlier than 1513), Raffaele has shown that he could rival the Flemish masters in the accurate imitation of ordinary household objects. The Violin-Player, in the Sciarra palace at Rome, also bears the date of 1518. The portraits of Joanna of Aragon, Baltasar Castiglione, and others, we have not space to dwell on.

Raffaele occupied himself with architecture as well as painting, and seems to have felt a zealous interest in all remains of ancient art. The Psyche and the Galatea, executed in the Farnesina at Rome for Alessandro Chigi, are his principal works which represent mythological subjects.

On his birthday the 6th of April 1520, being Good Friday, this greatest of all modern painters died of an attack of fever, at the age of thirty-seven. All that is recorded of his public and private character represents him as most amiable, and as the object of sincere affection on the part of his immediate friends. As an artist he was especially distinguished in two things. In the first place, whatever was the principle of art which he adopted at different periods of his life, in each and all successively he attained the greatest excellence. In his early pictures the spirit of Perugino and of the Umbrian school beamed with double purity and beauty; but his powers were not limited within the narrow circle which hemmed in his master and caused him to reproduce the same forms and the same expression through the course of a long life. Raffaele came to Florence at a fortunate moment. The anatomical studies of Leonardo and M. Angelo, and the powers of Masaccio, had exactly provided the fresh food for which his genius was craving. The religious feeling of his earlier works became a little unspiritualised in the worldly city of Florence, but his technical power received a great accession of strength, while his capacity for seizing real life is sufficiently shown by the portrait of Maddalena Doni. His Madonnas at this time lose something of their thoughtful melancholy, and often acquire a smiling character, such as we find in the works of Leonardo. Still his pictures exhibit excellence peculiar to himself.

In his third period, many persons, like Monsieur Rio (*l'Art Chrétien*) may consider the 'Disputa' as the last gleam of primitive simplicity or beauty. It may be said that thenceforth the Christian painter became paganised by contact with the heathen courts of Julius II.

and Leo X. It is true that at this particular time a change took place in the style of art adopted by Raffaele. He had acquired a new sense for the effect of masses in his drapery and in his lights and shades, and he worked on principles more consonant with the modern notions of picturesque composition. Which of the two sources of pleasure from painting is the purest and the most genuine may be a subject of dispute; but there can be no dispute as to the fact that in each line, as he successively adopted them, Raffaele attained the highest pitch of excellence of which they respectively admitted. We cannot however allow that an artist who could execute the Cartoons had lost the power of conceiving and worthily embodying Christian subjects.

The second consideration which seems to place Raffaele before all other painters is the fact that of the large number of works attributed to him with any certainty, hardly one can be called ordinary or common-place in its character. If we consider the early age at which he died, his pictures are very numerous. The best of them are confessedly superior to the finest productions of other masters, and their average quality is in a still greater degree superior to the average quality of the works of any other painter. Besides the 'St. Catherine,' and the 'Portrait of Julius II,' mentioned above, the National Gallery possesses a small fraction on panel, by Raffaele, of 'The Vision of a Knight,' with the original pen-and-ink drawing from which it was traced; also a portion of a cartoon of 'The Murder of the Innocents,' painted over with oil. The university of Oxford has the good fortune to possess an admirable collection of Raffaele's drawings, a part of the fine collection formed by Sir Thomas Lawrence.

RAFFLES, SIR THOMAS STAMFORD, the son of a captain in the West India trade, was born at sea, off Jamaica, July 5, 1781. His early education was imperfect, for he was taken from school at the age of 15, and placed as an assistant clerk in the India House. In this situation he showed so much talent and industry, that he attracted the notice of the directors, and in 1805 was appointed under-secretary to the new government formed by the East India Company at Pulo-Penang, or Prince of Wales' Island. Here he devoted his attention to the study of the Malay language, the vernacular dialect of almost all the Eastern islands, in which he made rapid progress, as well as in a knowledge of the productions of Penang and the adjoining country, and the manners of the inhabitants. These acquirements rendered him so useful to the government, that he was soon appointed chief secretary, an office which he filled with the greatest ability: intense application in an unhealthy climate, however, soon brought on serious illness, which compelled him to go to Malacca, in 1808, for the recovery of his health.

During his stay at Malacca, Raffles had an opportunity of mixing with a great number of natives congregated there from all parts of the Archipelago, from China, Cochin-China, &c., with whom he freely associated. He thus obtained a very considerable knowledge of their customs, trades, and languages, which was afterwards of great value to him. In 1809 he published his first literary essay, 'On the Malay Nation,' by which he attracted the notice of Lord Minto, governor-general of India, who sent for him to Calcutta, and was anxious to place him in the government of the Moluccas. Other events however interfered with this intention, for Raffles so strongly represented to Lord Minto the advantages which would accrue to the English government from the reduction of the Dutch settlement of Java (Holland being at that time annexed to France), that an expedition was fitted out against Batavia, in 1811, which was attended with complete success, that place being speedily captured. Raffles offered such valuable assistance in the preliminary arrangements of this expedition and in the execution of it, that he was appointed lieutenant-governor of Java and its dependencies. He was only thirty years of age when he undertook this responsible situation, which he held for five years, being recalled in 1816, shortly before the island was restored to the Dutch. In his administration he evinced great energy of character, and displayed an anxious desire to advance the welfare of the native population. He found it necessary to make great alterations in the economy of the government, and a complete revision of the judicial system of the colony. He likewise abolished the system of slavery in the island. The policy of some of his measures was considered doubtful by the authorities at home, and his youth made him an object of jealousy to some of his colleagues; a number of charges were consequently brought against him, which led to his recall. But the board of directors of the East India Company afterwards acknowledged that his measures were all undertaken from most benevolent and laudable motives. Raffles devoted a considerable portion of time to the investigation of the natural productions of Java, and during his residence there he made many excursions into the interior, and collected much geological and geographical information respecting the island, as well as many interesting facts concerning the numerous ruins and other antiquities, and the character of the different native tribes. He arranged and published the different materials which he had thus collected, on his return to England, in his 'History of Java,' which appeared in 1817, 2 vols. 4to.

In 1818 he was appointed lieutenant-governor of Fort Marlborough, the seat of the English government at Bencoolen, on the island of Sumatra, and again returned to India, having first received the honour of knighthood. He remained at Bencoolen six years, during which

time he effected many improvements in the political constitution of the colony and in the condition of the inhabitants. He emancipated the slaves here, as he had done in Java, for which act he did not however escape censure. He established a British settlement at Singapore, which has proved a most important commercial station, and founded a college there for the encouragement of Anglo-Chinese and Malay literature. Though distinguished by his administrative abilities, Sir Stamford Raffles owes his reputation chiefly to his researches into the natural productions of Sumatra, and particularly to his numerous zoological discoveries. During one of his journeys into the interior, accompanied by the enterprising and lamented Dr. Arnold, he discovered the gigantic parasitical plant (or rather flower) which has been called the 'Rafflesia Arnoldii.' In 1820 he sent home a large collection of preserved animals, which are now in the museum of the London Zoological Society. The excitement of various official and scientific engagements in a pestilential country, together with many domestic afflictions (four out of his five children, and almost all his personal friends, dying from the effects of the climate), so completely destroyed his health, that he was obliged to resign his appointment and return to England in 1824. In February of that year he embarked with Lady Raffles on board the ship *Fame*, which took fire the same night, by the carelessness of the steward. The crew and passengers with difficulty saved themselves in the boats, and Sir Stamford was obliged to remain at Bencoolen till the following April. By this disastrous event he entirely lost the greatest part of the extensive collection which he had formed of animals and plants, as well as many volumes of manuscripts and drawings relative to the civil and natural history of nearly every island in the Malayan Archipelago; besides this, which might be considered as a public loss, his own pecuniary loss by the burning of the ship amounted to upwards of 20,000*l*.

After his return to England he founded the present Zoological Society, of which he was the first president. His health, however, never recovered the shock which it had sustained, and he died in 1826, before he had had time to arrange the numerous materials which he had collected in the East. He left several manuscripts behind him. ('Memoir by Lady Raffles.')

\* RAFN, CARL CHRISTIAN, the great living promoter of Icelandic literature, was born on the 16th January 1796, at Brahesborg in the island of Funen. Even when a boy at the Cathedral-school of Odensee he voluntarily applied himself to the study of Icelandic; he followed up the same pursuit at the University of Copenhagen, where he took his degrees in jurisprudence. Being appointed in 1821 to a post at the university library, his attention was directed to the vast quantity of Icelandic manuscripts, yet unpublished, belonging to the collection bequeathed there by Arnas Magnæus, and to the use that might be made of them for shedding a light on hitherto obscure portions of history. Early in 1824 he had a meeting of three Icelandic students at his lodgings to consider of the best means of promoting this object, and in 1825 he proposed and set on foot the "Society for Northern Antiquities," "Selskab for Nordisk Oldkyndighed," which a few years after was taken under the patronage of the King of Denmark, and which has awakened the attention of the world to the subject it has prosecuted. Rafn was appointed its earliest secretary, an office which he continues to hold, and he has devoted his life to its objects. It had been customary to issue such Icelandic works as were published by the Danish government and the Arne-Magnæan Commission, in volumes of cumbersome size, with Latin or Danish translations and sometimes both, printed on the same or opposite pages, and altogether in the most unattractive form. Under Rafn's direction twelve volumes of the 'Forumanna Sögur' or 'Stories of the Ancients' were printed in portable octavos, twelve volumes of a Danish translation and twelve of a Latin were printed to correspond with them, and thus the student had an opportunity of acquiring either the original only, or in case he wanted one, whichever translation he pleased. Rafn took a great share in the translation and editorship connected with these works and with the other publications issued by the society. The 'Antiquitates Americanae,' issued by him in a quarto volume in 1837 is of all the one that has produced the most sensation. In this a collection is made of all the passages in the old Icelandic sagas which describe the voyages to and history of Vinland. A summary in English by Dr. Rafn is prefixed, entitled 'America discovered by the Scandinavians in the Tenth century, an abstract of the historical evidence contained in this work.' The abstract, which was reprinted in the 'Transactions of the London Geographical Society,' has been translated into every language of Europe, from Polish to Portuguese, and it is now a received doctrine that Massachusetts had been reached by the Northmen five centuries before Columbus. Dr. Rafn is now engaged on a similar work entitled, 'Antiquités Russes,' to prove by scattered passages from the sagas that the Russian monarchy was founded by Scandinavian sea-rovers. In his 'Gronlands Historiske Mindesmærker,' or 'Historical Memorials of Greenland,' (3 vols. 1838-40) brought out in conjunction with Finn Magnusson, he rendered a similar service to the less attractive annals of that barren coast. Among his other works is an edition of the 'Færeyinga Saga,' or 'History of the Feroe Islands,' in which the Icelandic original is accompanied not only by a Danish translation but by one in the Feroe language, made by a resident clergyman, and a

critical edition of the 'Krakamal,' the celebrated death-song of the pirate Ragnar Lodbrok, said to have been sung by him when, being taken prisoner by Ella, king of Northumberland, he was shut up in a barrel with snakes, and concluding with the famous line "Laughing will I die." Rafn has of course had much to do as secretary with the publication of the 'Transactions' of the Society of which he is the founder, and with the issue of the volumes of 'Mémoires,' in which select essays from the number are translated in German, French, or English. It is to his exertions, commencing as early as 1818, that the Icelanders are indebted for the foundation of a public library for their benefit at Reikiavik; he also carried out in 1827 the establishment of a library at Thorshavn, the capital of the Feroe Islands, and in 1829 of another at Godthaab in Greenland. He is a doctor of philosophy, has the title of Etatsraad or 'State Counsellor' and has been since 1828 a knight of the order of Dannebrog.

RAGLAN, JAMES HENRY FITZROY, BARON (previously Lord FITZROY SOMERSET), was the younger son of Henry, fifth duke of Beaufort, by Elizabeth, daughter of Admiral the Hon. E. Boscawen, and was born in 1788. He received his early education at Westminster School, but before completing his sixteenth year obtained a commission in the 4th Light Dragoons. In 1807 he attended the late Sir Arthur Paget in his embassy to Constantinople; and was in the same year placed on the staff of the Duke of Wellington. Two years later he became aide-de-camp to the duke, in which capacity Lord Fitzroy Somerset was present in every engagement throughout the Peninsular campaign. He was wounded at Busaco, and he was among the first who mounted the breach at the storming of Badajoz. Having been promoted to the rank of lieutenant-colonel, he attended the Duke of Wellington as aide-de-camp at Waterloo, where he lost his right arm; and in consequence of his military services he was made a K.C.B. and a colonel in the army. In 1814 he had acted for a short time as secretary to the embassy at Paris, and so great was the confidence reposed in him that he remained in that city as minister plenipotentiary *ad interim* from the following January to March. He continued to act as secretary to the embassy at Paris until 1819, when he was appointed by the Duke of Wellington, then master of the ordnance, to be his military secretary. This post he retained until 1827, when he accompanied the duke to the Horse Guards as military secretary. Here he remained until after the duke's death in September 1852. He had accompanied the duke to the congresses of Vienna and Verona in 1822, and to St. Petersburg in 1826, and on another occasion was sent on a special mission to Madrid. He also represented the borough of Truro in the parliaments of 1818 and 1826.

Upon the death of the Duke of Wellington, and the promotion of Viscount Hardinge to the command of the army, Lord Fitzroy Somerset was appointed Master-General of the Ordnance, and raised to the peerage as Baron Raglan, a title derived from Raglan Castle, a ruin in possession of the ducal family of Beaufort. He had been little more than a year at the head of the Ordnance when war broke out between England and Russia, and Lord Raglan was appointed to command the forces sent out to the east, with the rank of full general. He left England in March 1854, and after spending some months at Varna and Constantinople, during which time the army suffered very severely from sickness, he landed on the shores of the Crimea in the September following. In conjunction with Marshal St. Arnaud, who commanded the forces of our French allies, he fought the battle of the Alma on the 20th of that month. It has been stated that he wished to attempt carrying Sebastopol by a *coup-de-main*, but this not being agreed to by his colleagues, it was determined that it should be invested. Unfortunately, the siege proved one of longer duration than either of the generals had calculated. Difficulties in furnishing provisions and clothing for the troops, which appear to have been for a long time but feebly attempted to be overcome, resulted in a large portion of both the English and French troops perishing in the trenches before Sebastopol during the subsequent winter, 1854-55. The failure of more than one assault upon that city, and the consequent loss of his men, for whose sufferings he felt most tenderly, together with the censures of the English press upon his line of conduct, unhappily increased the symptoms of diarrhoea, by which he was attacked in the following June, and he died in camp before Sebastopol on the 28th of that month, leaving behind him the memory of an able and brave soldier and a general of high ability, who commanded at once the confidence and respect of his men. The general orders issued by the commander-in-chief at home, and by Marshal Pelissier, his colleague in the divided command over the allied troops in the Crimea, bore testimony to his great and important services. His body was carried back to England, and interred in the church of Badminton, Gloucestershire. A life pension of 1000*l.* a year was settled on his widow, and 2000*l.* a year on his son, who succeeded him in his title. He married, in 1814, Harriet, daughter of the third earl of Mornington, and niece of the Duke of Wellington, by whom he left two daughters and an only son, Richard Henry Fitzroy, now second Lord Raglan, who was formerly in the civil service at Ceylon, and afterwards held the post of secretary to the King of Hanover. His eldest son, a major in the army, was killed in the first Punjab campaign, while serving on the staff of Lord Gough, in December 1845.

RAHBK, KNUD LYNE, a Danish author, whose name is con-

stantly recurring in the literary history of Denmark for an entire half century, was born at Copenhagen on the 18th of December 1760. His father, who held the office of 'Toll-inspector,' gave him an excellent education, sending him to the school of Herlufsholm and the University. His father's maternal uncle, Knud Lyne, after whom he was named, had made a fortune of what is called in Denmark "a ton of gold"—20,000 rix-dollars, or about 2,400*l.*—and of this he bequeathed 12,000 to his namesake, who proposed to live on the interest and spend his time in literature, and in the theatre, to which he was ardently attached. The scheme turned out impracticable, and the money oozed through his hands, but he obtained in 1790 the professorship of *Æsthetics* at the University of Copenhagen; from 1798 to 1805 he was teacher of history at an institute, and from 1806 to 1816 he was lecturer to the actors at the theatre on the dramatic art, becoming afterwards an active member of the managing committee. Above all he was indefatigable with his pen. By these means combined, he obtained a position which enabled him to extend a good-natured hospitality to nearly all the literary men of the capital, to whom the "Bakkehuus," as it was called, or "House on the Hill," Rahbek's residence, just outside of the gates of Copenhagen, became the ordinary point of assemblage. The honours were done by his wife, Karen Margrethe Heger, or 'Camma,' as he called her from the first two syllables of her Christian name. Oehlenschläger [OEHLenschläGER], who married Camma's sister, first saw her at the Bakkehuus. From 1798 to 1829 it continued to be the "Holland-House" of Copenhagen; it was then deprived of one of its chief attractions by the death of Camma, and in about a twelvemonth after, on the 22nd of April 1830, Rahbek followed her to the grave in his seventieth year.

Rahbek's works are very numerous. That which is generally considered the best is the 'Danske Tilskuer,' or 'Danish Spectator,' an imitation of its English namesake. It lasted from 1791 to 1806. A magazine, called 'Minerva,' which he commenced in 1785, was for a long period a leading periodical—in it Rahbek had an opportunity of developing his political sentiments, which, strange as they were, were shared by many Danes;—an equally ardent attachment to Jacobinism in France and to despotism in Denmark. His Lectures on the Drama delivered to actors are couched in a tone of somewhat ludicrous solemnity; his own plays are not considered of much value; his tales and lyric poems have a higher reputation. His 'Erindringer,' or 'Recollections,' written late in life, are, for a book of biography, far from entertaining. Some specimens will be found in William and Mary Howitt's 'Literature and Romance of Northern Europe.' Rahbek wrote a whole library of translations; among those from the English we remark Shakspeare's 'Macbeth,' and 'Merchant of Venice,' Colman's 'Jealous Wife,' Byron's 'Marino Faliero,' Scott's 'Halidon Hill,' &c.

RAIKES, ROBERT, was born at Gloucester in 1735. His father was a printer and conductor of the 'Gloucester Journal,' who, after giving his son a liberal education, brought him up to his own business, in which after a time he succeeded his father, and by care and diligence rendered the business prosperous. The events of his life present nothing beyond those of a successful tradesman in general; but as conductor of a newspaper he could not but have his attention frequently directed to peculiar conditions of society. The state of the County Bridewell was the first in which he prominently interfered. He found in it the indiscriminate mixture of offenders of all degrees of criminality, unprovided with food, clothing, or instruction of any kind, except what was bestowed in charity by the curious or benevolent who visited the prison. To remedy these evils he called attention to them in his newspaper, and he furnished means to provide the inmates with instruction and the means of labour from his own resources. As regarded Gloucester prison his efforts were in a great degree successful, but the evils against which he contended are unfortunately not yet uniformly removed from our places of confinement. In 1781, as he relates himself in a letter written in 1784, he was struck with the number of wretched children whom he found in the suburbs, chiefly in the neighbourhood of a pin-manufactory where their parents were employed, wholly abandoned to themselves, half-clothed, half-fed, and growing up in the practice of the most degrading vices. The state of the streets, he was told, was always worst on the Sunday, as of course children of somewhat advanced ages were employed in the factory, and on Sunday joined their old associates. Mr. Raikes determined to make an effort at some improvement. He began in a very unpretending manner. He found three or four decent women in the neighbourhood who were capable of teaching children to read, to each of whom he agreed to give a shilling for the day's employment; and then, with the assistance of the clergyman, endeavoured to induce the children to go to the schools so established. The success was extraordinary: children were not only eager to learn to read, but, on being supplied with Testaments, they began of their own accord to frequent places of religious worship. At first, he says, many children were deterred from attending the schools by want of decent clothing; to such he represented that "clean hands, clean faces, and combed hair," were all that was required at the school. The beneficial effects were so evident, that in a very short time Sunday-schools were established in all directions; and Mr. Raikes, before his death on April 5, 1811, had the satisfaction of seeing his first humble endeavour

at the improvement of a few children in his own town, become the most efficient means of educating the children of the poor throughout the kingdom. It was, we hope, only the first step; a second was the establishment of daily schools supported by the public; but farther advances are yet urgently required.

RAIMBACH, ABRAHAM, a distinguished English line-engraver, was born in London in 1776. His father was a Swiss by birth, but he settled in England at the early age of twelve, and never afterwards quitted it; his mother was the daughter of an English farmer in Warwickshire. When an infant, Raimbach fell from the arms of his nurse from a second-floor window; but his life was saved, partly by the inflation of his long clothes, and partly by his fall being broken by some leads below. He showed an early disposition to excel in the arts, and his father apprenticed him in 1789 to J. Hall, the engraver: Sharp and J. Heath had both declined to take him. The first work engraved by the young apprentice was the explanatory key to Copley's 'Death of Chatham,' in the National Gallery. After his term of apprenticeship was over he entered as a student in the Royal Academy, doing at the same time what work he could for the book-sellers. By attention and assiduity he was enabled to unite miniature painting with engraving; and he prospered in a short period so well in both that he was under the necessity of giving one of them up, and confining himself to the other: he chose engraving for his profession. In 1802, through some prints he executed for Smirke and Forster's illustrated edition of the 'Arabian Nights,' he was in such circumstances as enabled him to take advantage of the temporary peace, and he paid a visit to Paris to view the works of art which the victories of Napoleon I. had collected together in the Louvre. He has himself given a long account of this tour in his autobiography, published by his son. In 1805 he married, and established himself in a house given to him by his father in Warren-street, Fitzroy-square, in which he lived twenty-six years, and executed all his great works. In this year he made the acquaintance of Wilkie, and soon became that painter's intimate friend. In 1812 he became Wilkie's engraver, supplanting Burnet, who had already engraved some of Wilkie's pictures in an admirable manner. [BURNET, JOHN.] The first fruit of this partnership was the celebrated print of the 'Village Politicians.' This print at first went off slowly; but eventually the sale was large and steady, and a proof, of which there were 274, has sometimes been sold at auctions for fourteen or fifteen pounds. The next print was 'The Rent Day,' published in 1816, after which Wilkie and Raimbach made a tour together in the Netherlands. The rest appeared in the following order:—'The Cut Finger,' 'The Errand-Boy,' 'Blindman's Buff,' 'Distraint for Rent,' 'The Parish Beadle,' and in 1836 'The Spanish Mother and Child.' The last prints, compared with 'The Village Politicians' and 'The Rent Day,' were very unsuccessful speculations. Raimbach never employed an assistant, but executed the whole of the plate himself. 'The Rent Day' cost him two years and a half of incessant labour. His prints are very masterly works, and possess almost every quality but colour. He died on the 17th of January 1843, in very easy circumstances. His autobiography was published by his son in the same year, under the following title:—'Memoirs and Recollections of the late Abraham Raimbach; including a Memoir of Sir David Wilkie.'

RAIMONDI, MARC ANTONIO, commonly called by his baptismal names Marc Antonio only, was born at Bologna about 1487 or 1488. He was instructed in the art of design by Francesco Maria Raibolini, known as Francesco Francia; but having seen some prints by Albert Dürer, he determined on adopting engraving as a profession. It does not appear by whom he was instructed in that art, though most probably it was by some goldsmith, for his first essays with the graver were the embellishment of silver ornaments worn at that period. One of his earliest engravings on copper was a plate from a picture by Francia, representing 'Pyramus and Thisbe,' dated 1502, and executed, with some others, it is supposed, after the same artist, before Raimondi's departure from Bologna. At Venice, whither he removed, he purchased, with all the money he had taken with him from home, a set of thirty-six prints engraved on wood by Albert Dürer, representing the 'Life and Passion of Our Saviour.' Charmed with the correctness of the design and the precision of the execution, he imitated them on copper, according to Vasari, with such exactness, that they sold in Italy for the originals—from the difference of the methods a very unlikely circumstance. The same authority states that Dürer, having seen one of them at Nürnberg, complained to the senate at Venice of the fraud that had been practised, and that Marc Antonio was forbidden to use his signature, which was the only redress he could obtain. It seems that Vasari must have fallen into an error in this story, and mistaken the 'Life of Our Saviour' for the 'Life of the Virgin,' as Marc Antonio copied both sets from the cuts of Albert Dürer, to the latter and not to the former of which he affixed the mark of that great artist. M. Heineken also points out that, besides the tablet which Dürer used as his mark, Marc Antonio added within it his own initials joined, and that he also used the tablet without any mark at all. Indeed there seems altogether very little probability in the story told by Vasari. Persons acquainted with the subject of engravers' monograms are aware that the tablet of the peculiar form adopted by these two great rivals—namely, an oblong square, with a small arched piece on the centre portion of the

top—was a favourite mark of many artists, as may be seen on the works of Van Assen, Dolendo, Krugen, Saelert, and Voghter.

After quitting Venice, Marc Antonio proceeded to Rome, where he was soon noticed by Raffaele, who employed him in engraving from his designs, and, it is said, in some instances even traced the outlines on the plates, that the correctness of the drawing might be more perfectly preserved. His first plate after Raffaele was the Death of Lucretia, which is neatly engraved, but is not one of his best works. His next print, after the same master, was a Judgment of Paris, executed in a more bold and spirited style. These were followed by many more, and amongst them the Murder of the Innocents, after Raffaele, who was so perfectly satisfied with the efforts of the engraver, that he sent many specimens of his works as complimentary presents to Albert Dürer himself, by whom they were thought well worthy of acceptance. After the death of Raffaele, which occurred in 1520, Giulio Romano engaged Marc Antonio to engrave from his designs. Amongst these works are a set of disgusting plates of subjects for which Aretino composed the verses, and which so greatly excited the indignation of Pope Clement VII., that he ordered the engraver to be thrown into prison, from which he was only released at the earnest intercession of some of the cardinals and of Baccio Bandinelli. Moved by gratitude for the services of Bandinelli, Marc Antonio engraved his celebrated print of the Martyrdom of St. Lawrence from a picture by him, which, besides greatly conducing to the engraver's high reputation, procured him not only the entire pardon of the pope, but his active protection and support. On the sacking of Rome by the Spaniards, in 1527, he was obliged to fly, having lost all he had acquired by his art. He returned to his native place, where he continued to engrave until the year 1539, which is the date affixed to his last plate, representing the Battle of the Lapithæ, after Giulio Romano. He is said by Malvasia to have been assassinated by a Roman nobleman for having, contrary to his engagement, engraved a second plate of the Murder of the Innocents, from the design of Raffaele.

This engraver may be considered one of the most eminent artists in that branch that has ever appeared. His outlines are pure; the character and expression of his heads beautiful; while the exact and correct drawing of his works, particularly in the extremities of his figures, evidence that he was in all respects a complete master both of drawing and design. He was one of the first Italian engravers of distinction. The high reputation of Raffaele, and the happy chance which conducing to the engagement of Marc Antonio as the engraver of his chief works, contribute as well to his reputation as to the high value which is ever set upon his engravings, and the great price they always obtain. Berghem paid sixty florins for an impression of his Murder of the Innocents; and one of Saint Cecilia was sold at the sale of St. Yves for six hundred and nineteen francs. M. Ponce has given the date of his death as 1546; but M. Heineken seems to consider that the date upon the Battle of the Lapithæ was about the period at which he ceased to work. Some of his prints are marked with an A. and an M. joined, and others with M. A. F. also joined, the F. being used in consequence of the cognomen La Francia having been given to him from his successful study under Raibolini; and some are marked with the tablet mentioned by Heineken.

The works of Marc Antonio are exceedingly numerous. A very copious catalogue of them is given by Heineken, which extends to a hundred and twenty-five pages. Mr. Bryan observes, that in the prints of this eminent artist great attention should be paid to the different impressions of the plates, which have been greatly retouched and altered by the different printsellers through whose hands they have passed. The best impressions are without the name of any publisher. After the plates were taken from the stock of Tommaso Barlacchi, they came into the possession of Antonio Salamanca; afterwards they passed through the hands of Antonio Laferri, thence to Nicholas van Aelst, and lastly became the property of Rossi, or De Rubens, at a time when they were nearly worn out.

In the Print Room of the British Museum there is a very fine collection of the works of Marc Antonio. They amount to above five hundred, the whole of his labours enumerated by Bartsch being six hundred and fifty-two; but it must be recollected that the works of two of his principal pupils, Agostino Veneziano and Marco da Ravenna, are counted with them. Amongst those of the greatest rarity are the Transgression of Adam and Eve; David cutting off the head of Goliath, before the monogram of Marc Antonio was added, a copy of which produced 45*l.* at the sale of the late Sir M. M. Sykes, Bart., in 1824; the Madonna lamenting over the dead body of Christ, called 'La Vierge au bras nud,' from the circumstance of having one arm naked, a print of much value, a copy of which fetched at the same sale 25*l.*, whereas the other print of the same subject, which has the arm draped, engraved also by Marc Antonio, produced only 2*l.*; the Massacre of the Innocents, with the chicot-tree; the Martyrdom of St. Lawrence, a subject mentioned above, a first impression with the two forks, of the estimated value of a hundred guineas, a very inferior copy of which, as to condition, produced at the above sale 46*l.*; the Pest, a proof taken before the letters were engraved, of which only three copies are known to exist; and the Dance of Cupids, a small plate, which, if in good condition, is valued at 60*l.*, a copy of which sold at the sale before alluded to for 57*l.*

RALEIGH, SIR WALTER, was born in 1552 at Hayes, in the

parish of Budleigh, near the coast of Devonshire. He was the second son of Walter Raleigh and his third wife Catherine, daughter of Sir Philip Champenon and widow of Otho Gilbert, Esq., of Compton, Devon. Sir Humphry Gilbert, whose name is connected with the attempts to discover a north-west passage, was Sir Walter Raleigh's half-brother. In the retired neighbourhood of Budleigh, Raleigh received the rudiments of his education. He was entered a commoner of Oriol College, Oxford, in or about 1568, where, to use the words of Anthony Wood, "he was worthily esteemed a proficient in oratory and philosophy." In 1569 Raleigh accompanied his relative, Henry Champenon, with a volunteer corps to France in aid of the Huguenots. He served in France five years, and subsequently in the Netherlands as a volunteer under the Prince of Orange. In 1576 Sir Humphry Gilbert obtained a patent to colonise any parts of North America not settled by the allies of England. Raleigh and Gilbert attempted a joint expedition, from which Raleigh returned unsuccessful in 1579. In the next year we find him commanding a company of the royal troops in Ireland during the rebellion raised by the Earl of Desmond. Some difference arising between the Lord Deputy Gray and Raleigh, the latter was called upon to defend himself before the council, which he did with so much ability and grace that he gained the queen's ear. The romantic incident which tradition gives as the origin of his favour with the queen is well known. In two or three years from the time he was introduced at court he was knighted, made captain of the guard, seneschal of the county of Cornwall, and lord warden of the stannaries; and he received a grant of 12,000 acres of the forfeited estates of the Earl of Desmond, and a lucrative patent for licensing the vendors of wine in England.

In 1583 Sir Humphry Gilbert sailed on a second expedition to North America, towards which Raleigh, now too much engaged at court to accompany it himself, subscribed 2000*l*. This attempt also proved abortive, and Gilbert perished on his return in a storm in which his ship foundered. Raleigh, undismayed, obtained for himself in 1584 a patent investing him with power to appropriate, plant, and govern any territories that he might acquire in North America. In 1585 the first body of colonists landed, under the government of Mr. Lane, in Virginia, so called in honour of the virgin queen. Harriott, a celebrated mathematician of the day, went out to survey the colony; his survey and report, and the introduction of the potato and the tobacco-plant into England for the first time, were almost the only fruits of this attempt. [HARRIOTT.] The misconduct of the colonists brought the hostility of the Indians upon them; and they re-embarked within a year on board Sir Francis Drake's squadron, who visited the Chesapeake on his homeward voyage. A second body went out in 1587 with instructions to form an agricultural colony, on the Bay of Chesapeake, where was to be founded the 'City of Raleigh.' The colonists landed on Roanoke Island, in what is now the state of North Carolina; but they were disheartened, and this expedition also failed. The governor returned home for fresh forces, which were very difficult to obtain, as he arrived in the height of the preparations for the Spanish invasion. Raleigh however despatched two small vessels, which were plundered at sea, and forced to put back; and when at length assistance was sent out, the colonists had been murdered by the Indians. In 1589, having expended 40,000*l*. in the attempt, and finding that his resources were unequal to the forming of a colony, he made over his patent to a company of merchants. Raleigh has been charged with neglecting those wretched men who were left among the Indians; but it appears from Purchas that previous to the year 1602 he had sent five several times, at his own charge, to find these people, who were left in Virginia in 1587 (iv., p. 1653). In America the memory of Raleigh has always been cherished, and Mr. Bancroft thus concludes his notice of these abortive attempts to form a settlement:—"After a lapse of nearly two centuries [in 1792] the state of North Carolina, by a solemn act of legislation, revived in its capital 'the City of Raleigh;' thus expressing its grateful respect for the memory of the extraordinary man who united in himself as many kinds of glory as were ever combined in an individual." ('History of America,' vol. ii., chap. 3.)

In 1587 Raleigh had been appointed one of a council of war to put the forces of the realm in the best order to withstand any invasion, and had command of the forces in Cornwall, of which county he was lieutenant-general. In July 1588, after the Armada had passed up the channel, he joined the British fleet with a small squadron, and greatly distinguished himself in the several engagements which ended in the discomfiture of the Spaniards. As a reward for these services he received an augmentation to his patent of wines, and the right to levy tonnage and poundage on them. In 1589 he accompanied the Lisbon expedition under Drake and Norris, the object of which was to place Don Antonio on the throne of Portugal. [ANTONIO.] In 1591 he sailed on an expedition to intercept the plate fleet, which was unsuccessful; and during his absence, the queen having discovered that an intrigue existed between Raleigh and Elizabeth, daughter of Sir Nicholas Throckmorton, one of the maids of honour, he was immediately on his return thrown into the Tower. Raleigh married Miss Throckmorton, and on being released after a short confinement, retired to his estate of Sherborne in Dorsetshire. It was during this retirement that he formed his scheme for the discovery and conquest of El Dorado, that fabulous land of gold and unbounded wealth in the

interior of South America, in the existence of which he firmly believed. On the 5th of February 1595 Raleigh sailed from Plymouth with five vessels, and arrived at Trinidad about the end of March. He surprised the newly-founded town of San Josef, and took prisoner the governor, Don Antonio Berrio, from whom he extracted information which enabled him to ascend the Orinoco about sixty leagues, when he was forced to return. He arrived in England towards the end of the summer of 1595. Raleigh published an account of this voyage, under the sounding title of 'The Discovery of the Large, Rich, and Beautiful Empire of Guiana,' a work which had not the merit of any methodical arrangement of the matter, though it contains numerous vigorous passages, such as characterise the style of Raleigh. His restoration to favour at court, which took place shortly after, prevented any further prosecution of his designs on Guiana during the reign of Elizabeth. In 1596 he was employed, with the rank of rear-admiral, at the taking of Cadiz, where he greatly distinguished himself, and was severely wounded in the leg. In 1597 he took Fayal. About this time he was restored to his post of captain of the guard, and appointed governor of Jersey. He now became deeply engaged in court intrigue, and combined with Cecil, who afterwards crushed him, to destroy the Earl of Essex. He strongly urged Cecil, in a remarkable letter which appears among his works, to put down the earl, and not to fear "the after-revenge" of his friends or his son; but it is doubtful whether this letter was written before or after the condemnation of Essex, as it has no date. Raleigh turned his influence with the queen to good account, by procuring a remission of the sentence for such of Essex's adherents as could afford to purchase his good offices. One of these, Mr. Littleton, paid Raleigh 10,000*l*. A transaction so shameless has no other apology than that it was not condemned by the opinion of the age. But if in such a matter Raleigh did not possess a higher standard of morality than his contemporaries, in the House of Commons, of which he had been elected a member some years prior, he made himself conspicuous by advocating principles far before his age: he maintained that every man should be left at liberty to employ his capital and labour where and how he liked, and that all restrictions on the trade in corn should be removed.

After the death of Elizabeth, Raleigh's fortunes fell. His haughtiness and rapacity, with the share he had in the ruin of Essex, had made him universally disliked; and Cecil, his former friend and associate, had completely poisoned James's mind against him. The post of captain of the guard was speedily given to another, and his wine-patent was withdrawn. An opening soon offered for a more serious attack. James had not long been seated on the throne before two or three plots against him were discovered. Among these was one named the Spanish or Lord Cobham's treason. Lord Cobham being intimate with Raleigh, the idea of his participation instantly suggested itself. Raleigh being examined before the council, declared his utter ignorance of any plot; but admitted that he was aware of some intercourse having taken place between Cobham and the Count D'Arenberg, the Flemish ambassador, and he recommended that La Renzi, one of that nobleman's suite, should be examined. This being made known to Cobham, he flew into a violent rage, declared that in all his intrigues he had been instigated by Raleigh, and that the money to be paid by Spain was to be lodged in the island of Jersey, of which island Raleigh was governor. He shortly afterwards fully and solemnly retracted all that he had said against Sir Walter, who was nevertheless committed to the Tower on a charge of high-treason in July 1602. While there he made an attempt at suicide by stabbing himself. In September 1603 Raleigh was tried at Winchester, and found guilty. Doubts have frequently been thrown on the whole of the facts connected with Raleigh's accusation. That his condemnation was procured by the power of his enemies, and that the verdict of the jury was not justified by the evidence, there can be no doubt; but it is certain that such a plot did exist for placing Lady Arabella Stuart on the throne, that the archduke knew of it, and that his minister Arenberg had corresponded with Cobham on the subject, and had promised a sum of money in support of it. It seems at least probable that Raleigh was aware of Cobham's correspondence, although he might not be an actual participator in the plot. The best account of this celebrated trial will be found in Mr. Jardine's 'Criminal Trials.'

Raleigh's conduct during his trial entirely changed the general feeling of dislike entertained towards him: an eyewitness observed, "In half a day, the mind of all the company changed from the extremest hate to the greatest pity. He was relieved and sent to the Tower, where he was confined for thirteen years. His family suffered severely by his attainer; he had some years before conveyed his estate of Sherborne to his son, reserving his own life-interest, which was now forfeited, and a slight flaw being discovered in the deed of conveyance, Carr, the king's vile favourite, afterwards notorious as the Duke of Somerset, petitioned for and obtained the estate for himself, reserving only 8000*l*. as a compensation for Raleigh's family: Raleigh's lands of Pinford, Primesly, and Barton, were also escheated and made over to the king's minion.

During his long imprisonment Raleigh turned to intellectual pursuits, and with many minor pieces, executed his greatest work, 'The History of the World,' a project of such vast extent, that the bare idea of his undertaking it excites our admiration. As an author, Hume says, "he is the best model of our ancient style," and Hallam

observes that he is "less pedantic than most of his contemporaries, seldom low, and never affected." The first part of the 'History of the World,' which is all that Sir Walter Raleigh completed, is contained in five books, commencing with the creation, and ending with the second Macedonian war, about 150 years before Christ. It was his intention to continue the history in two more volumes, which he says, "I also intended, and have hewn out;" but the death of Prince Henry, to whom the book was 'directed,' and who had always shown a warm interest in his fortunes, "besides many other discouragements, persuaded him to silence."

In 1615, Cecil being dead, and Somerset disgraced, Raleigh bribed the uncles of Buckingham, the new favourite, and induced Sir Ralph Winwood to recommend his project of opening a mine in Guiana. Upon this he was released conditionally. He equipped thirteen vessels for this expedition, which, from the magnitude of the undertaking and the celebrity of his name, attracted much attention, and Raleigh's ship was visited by all the foreign ambassadors. The fleet reached the Coast of Guiana about the middle of November 1617. Raleigh was so unwell that he could not ascend the Orinoco in person. Captain Keymis, the steady follower of Raleigh, led the exploring party, consisting of five companies of fifty soldiers each. A conflict took place with the Spaniards near St. Thomas, a small town recently built, in which the Spanish governor and Raleigh's eldest son Walter were slain; after which Keymis, having spent about twenty days in a fruitless search for the mine, and suffered considerable loss, returned to the fleet. Keymis, meeting with nothing but reproaches for his ill success, committed suicide. Raleigh sailed for Newfoundland to victual and refit; intending possibly to return to Guiana, but certainly in the meantime to attack the Spanish plate fleet, if he could fall in with it. Before he could reach Newfoundland the fleet separated, and on his arriving there, his own crew mutinied, and the majority declaring for a return to England, he was forced to accompany them. He arrived at Plymouth in July 1618, and a proclamation being issued by the king against him, he was shortly after arrested by Sir Lewis Stukely, vice-admiral of Devonshire. He was conveyed to London, and on his journey made some ineffectual attempts to escape, and at Salisbury he feigned sickness. James, strongly urged by the king of Spain to punish Raleigh for his attack on St. Thomas, and being anxious to gratify that monarch, in order to advance the marriage of his son Charles with the infanta, laid the case before his council, when it was argued that Raleigh, being under an unpardoned sentence for treason, was civilly dead, and accordingly could not be tried again. James, bent on somehow sacrificing Raleigh, readily adopted this view, and resolved to carry into execution a sentence sixteen years old, which had been followed by an imprisonment of thirteen years. Raleigh was brought up before the Court of King's Bench to receive sentence on the 28th of October 1618, and beheld the next morning, in the sixty-sixth year of his age. His conduct after his committal to the Tower, and up to the moment of his death, was so calm and resigned, as to move the sympathy even of his enemies.

Of Sir Walter Raleigh's character and personal appearance, Aubrey says, "he was a tall, handsome, and bold man, but his nose was that he was damnable proud: he had a most remarkable aspect, an exceeding high forehead, long-faced, and 'sour eie-lidded, a kind of pigge-eie.'" In an age of magnificence in dress, Raleigh was conspicuous for his splendour. Of an original and versatile genius, an eminent commander by sea and land, a navigator and discoverer of new countries, an accomplished courtier, a statesman, a proficient in the mechanical arts, a poet of no mean ability, Sir Walter Raleigh was one of the most remarkable characters of an age celebrated for its eminent men. Not much perhaps can be said in favour of his moral character: he was crafty and rapacious, and his conduct was not regulated by truth and probity; but he had kindly affections, and was much beloved by his dependants. Sir Walter was the author of many smaller pieces on a variety of subjects, philosophical, political, naval, military, geographical, besides letters, and a collection of small poems. He had two sons by his wife: the elder was killed in South America; the second, Carew, who was born in the Tower, survived him.

RALPH, JAMES, was born at Philadelphia, in what year is not recorded, and passed the earlier part of his life there as a school-master. In 1725 he came to England in company with his townsman Benjamin Franklin. What was the nature of his occupation is unknown. He has been supposed to have had some employment about the court, but he more probably got his living by writing in the newspapers. In the first book of the 'Dunciad,' published in 1728, Pope mentions him as one of Walpole's 'gazetteers.' This same year appeared Ralph's first separate and acknowledged literary performance, a poem, entitled 'Night.' It is to this work that Pope alludes in the third book of the 'Dunciad,' where he exclaims—

"Silence, ye wolves, while Ralph to Cynthia howls,  
And makes night hideous; answer him, ye owls!"

To this passage is appended a note, in which Ralph is denounced as the author of "a swearing piece called 'Sawney,'" which it appears was an attack upon Pope and his two friends Swift and Gay. In this note he is declared to be wholly illiterate as well as venal, but an admirer in the 'Biographia Dramatica' says, "It is very certain that

he was master of the French and Latin languages, and not altogether ignorant of the Italian; and was in truth a very ingenious prose writer, although he did not succeed as a poet." His dramatic writings are—'The Fashionable Lady, or Harlequin's Opera,' produced at the theatre in Goodman's Fields, in 1730, with some success. 'The Fall of the Earl of Essex,' a tragedy (altered from the 'Unhappy Favourite' of John Banke), brought out at the same house in 1731; the 'Lawyer's Feast,' a farce, performed at Drury-Lane in 1744; and the 'Astrologer,' a comedy, "once acted," says the title-page "at Drury-Lane," also in 1744. 'The Astrologer' was only an alteration of an old play, called 'Albumazar,' written by a Mr. Tomkin, of Trinity College, Cambridge, in 1615. Another of his latter publications was a tract, entitled 'The Case of Authors;' it was probably an argument for the protection of dramatic copyrights; though his own do not seem to have been in much danger of infringement.

Most of Ralph's publications however were political pamphlets on the topics of the day; and he is also supposed to have continued to be an active contributor to the public journals to the end of his life. He attached himself latterly to the faction of the Prince of Wales, and frequent mention of him may be found in Bubb Dodington's 'Diary.' Horace Walpole, in his 'Memoirs of the Last Ten Years of George II.,' also under date of 2nd of June 1758, gives an account of his journalising. According to this statement, Ralph "had the good fortune to be bought off from his last journal, the 'Protester,' for the only paper that he did not write in it." Other accounts however make him to have been 'taken off' by a pension towards the end of Sir Robert Walpole's time, in consequence of having then made himself so formidable to the ministry. The death of Prince Frederick (in March 1751) was an annihilating blow for the moment to Ralph, as well as to his patron Dodington, who had promised to make him his secretary if he should live to have the seals of secretary of state for the southern department, which the prince had engaged to give him ('Diary,' July 18 and 19, 1749); but it is said that he obtained a considerable sum from the government for the surrender of an important manuscript written by the prince, or under his royal highness's direction, which had come into his possession. On the accession of George III., he got another pension, which however he did not long enjoy, for he died of gout at his house in Chiswick, 24th January 1762. Of his political pamphlets, the only one which is now remembered is his answer to the Duchess of Marlborough's famous 'Account of her Conduct,' an octavo volume of four hundred and sixty-seven pages, entitled 'The Other Side of the Question, or an Attempt to rescue the Characters of the Two Royal Sisters, Queen Mary and Queen Anne, out of the hands of the D—s D— of —, in which all the Remarkables in her Grace's late Account are stated in their full strength, and as fully answered; the conduct of several noble persons is justified; and all the necessary lights are thrown on our Court history from the Revolution to the change in the ministry in 1710: in a letter to her Grace, by a Woman of Quality,' London, 1742. This is the ablest and most important of the various answers and defences which her grace's publication drew forth; and some things in it appear to have been supplied by the family of the late Earl of Oxford (the lord-treasurer Harley). Ralph is also the author of another anonymous work (published indeed without the name of either printer or bookseller) entitled 'Of the Use and Abuse of Parliaments; in Two Discourses, viz. 1. A General View of Government in Europe; 2. A Detection of the Parliaments of England from the year 1660,' 2 vols. 8vo, London, 1744. In an advertisement we are informed that the first of the two discourses, which however fills only seventy-eight pages of the first volume, is from the pen of Algernon Sydney. The rest of the book is a hasty performance, and of little value. But his principal work, also anonymous, is his continuation of Guthrie's History, entitled a 'History of England during the Reigns of King William, Queen Anne, and King George I.; with an Introductory Review of the Reigns of the Royal Brothers, Charles and James; in which are to be found the seeds of the Revolution. By a Lover of Truth and Liberty:' 2 vols. fol., London, 1744-46. Notwithstanding a systematic depreciation of King William, which runs through a great part of it, this work is written with spirit and acuteness, and contains many new facts and corrections of the views of the preceding historians.

RAMAZZINI, BERNARDO, was born at Carpi, near Modena, in 1633. He studied medicine at Parma, and took his doctor's degree there in 1659. He practised successively at Carpi and at Modena; and when the university of the latter place was instituted, he was appointed professor of the theory of medicine by the Duke Francis II. In 1700 he was invited to the second professorship of medicine at Padua, and in 1708 was raised to the principal chair there, though blind and so infirm that he earnestly desired to decline that honour. He died in 1714.

Ramazzeni was a frequent writer and a very warm controversialist both in medical and literary subjects. His first work was a series of letters in an acrimonious controversy with Moniglia, a physician of Modena. The works by which Ramazzini is now best known are 'De morbis artificum diatriba,' Mutin., 1770, and 'De abusu chinæ-chinæ diss. epist.' The former was translated into several languages, and among them into English in 1725. It contains a description of all the diseases to which each class of artificers is liable, as far as they

were then known, the descriptions being carefully drawn up both from the writings of his predecessors and from his own observations. The latter was intended to detract from the extravagant reputation which the Peruvian bark at that time enjoyed. The whole of Rameau's writings were published collectively at Cologne, in 1689, at London in 1717, and at several other places at nearly the same time. They are still held in high repute by the Italian physicians, who seem to regard their author with almost as much reverence as they did, who in his life-time honoured him with the title of Hippocrates III.

RAMEAU, JEAN-PHILIPPE, a very celebrated musician, equally distinguished by his compositions and by his numerous writings on the science, was born at Dijon, in 1683. His father who was organist in the Sainte-Chapelle of Dijon, taught his children to play from notes before they could read from letters, and his eldest son, the subject of the present notice, when only seven years of age was thought an able performer on the harpsichord. He pursued the usual studies at the college with considerable success, but an invincible desire, or instinct, as his biographer calls it, led him to music, to which he at length wholly devoted himself. At eighteen he set out for Italy, but proceeded not farther than Milan, where he became acquainted with a musical professor with whom he returned to France, and together they visited several of the principal cities, exercising their talents at each with pecuniary views. Soon, however, tired of a wandering life, that allowed him no opportunity for indulging in those speculative inquiries to which he was prone, he went to Paris, and there added largely to his stock of information. Afterwards he became organist of the cathedral of Clermont, in Auvergne, and continued long in that city, in which he wrote his 'Traité de l'Harmonie'; but not finding the means for printing a large quarto volume in a provincial town, he proceeded to the capital of France, where in 1722 he published his great work, and finally fixed himself. He was soon appointed organist of Sainte Croix de la Bretonnerie, and employed his spare time in writing in various theoretical treatises, in composing his harpsichord lessons, and in teaching. He did not distinguish himself in that line in which he was destined to excel till the year 1733, when, at fifty years of age, he produced the opera of 'Hippolyte et Aricie,' the drama by the Abbé Pellegrin. The success of this provoked much professional envy, if not national discord, and a feud was raised among the admirers of Lulli (LULLI) and Rameau, similar to that which in after times was carried to greater excess by the Gluckists and Piccinists. Till the production of 'Hippolyte,' Voltaire almost alone had discovered Rameau's genius for composition. He previously gave him his tragedy of 'Samson' to set, and discerned the beauty of the music; but its performance was prohibited under the pretext that it prostituted a sacred subject.

Of the many operas by Rameau, his 'Castor and Pollux,' produced at the Académie Royale de Musique in 1737, is the best: it was represented one hundred times. A chorus in this, of Spartans, 'Que tout gemisse,' has but few rivals, in either ancient or modern theatrical music. His 'Dardanus,' his 'Zoroaster,' and other pieces, were equally successful. From 1733 to 1760 he produced twenty-one operas and ballets, besides harpsichord and other compositions; together with many theoretical and controversial works. His merit was at length generally acknowledged. The king created for him the office of cabinet composer. Afterwards he granted him letters of nobility, and named him Chevalier de Saint-Michel. The Academy of Dijon had previously received him among their members, and the magistrates of that city exempted him, and his family, in perpetuity, from the tax called 'La Taille.' He died in 1764, leaving a son and a daughter, and was interred with every mark of respect and distinction.

As a theorist Rameau is best known by his large and laboured work on the 'basse fondamentale,' which he and his advocates treat as a discovery. But under other names the inversions of the perfect chord, or triad, and the chord of the seventh were known long before Rameau entered on the subject. Brossard, in 1702, in defining 'Trias Harmonica,' calls the under-note 'basse,' or 'son fondamentale,' and afterwards remarks that among the three sounds which compose the 'triade Harmonique,' the lowest is called 'basis,' or 'sonus fundamentalis.' But our limits do not allow us to go further into a subject which, to explain clearly, would fill many pages with arguments and examples. Rameau's style of writing is not remarkable for perspicuity. This was felt and acknowledged by his most zealous partisan, D'Alembert, who, in his 'Elémens de Musique, théorique et pratique, suivant les Principes de M. Rameau,' has endeavoured to clear the work from the obscurity in which it undeniably is involved; but the great French geometrician has only partially succeeded in his attempt.

RAMENGHI, BARTOLOMEO, called IL BAGNACAVALLLO, from the place of his birth, Bagnacavallo, on the road from Ravenna to Lugo, where he was born in 1484. He was a pupil of Raffaele, and one of his principal assistants in the Vatican; and after the death of his great master he carried the principles of his style to Bologna, and assisted to enlarge the character of that school. Raffaele was his model and test of excellence, and he did not attempt to look beyond him. Though possessing less vigour than Giulio Romano or Perino del Vaga, Bagnacavallo acquired more of the peculiar grace of Raffaele's style, especially in his infants, and his works were much studied by the great scholars of the Carracci. There are, or rather were, works by Bagnacavallo in San Michele in Bosco, San Martino, Santa Maria Maggiore,

and Sant' Agostino agli Scopettini, in Bologna. He died at Bologna in 1542, according to documents discovered by Baruffaldi. Giovanni Battista Bagnacavallo, who assisted Vasari at Rome, and Primiticcio at Fontainebleau, was the son of Bartolomeo Ramenghi. (Baruffaldi, *Le Vite de' più insigni Pittori e Scultori Ferraresi*; Lanzi, &c.)

RAMIRO II., son of Ordoño II., succeeded to the throne of Asturias and Leon by the abdication of his elder brother Alfonso IV., surnamed 'el Monge' (the monk), who, in 930, renounced the vanities of the world, and retired into the monastery of Sahagun. Ramiro rendered himself illustrious by his wars with the Mohammedans, from whom he wrested many considerable districts and towns. Soon after his accession to the throne (932), Ramiro, profiting by the internal troubles which at that time agitated the Mohammedan empire, made a successful irruption into the states of Abd-er-rahman, the reigning kalif, destroying Madrid, Talavera, and other towns; and when Almudaffer, the kalif's uncle, arrived at the head of considerable forces to revenge the outrage, he defeated him with dreadful carnage on the banks of the Duero, not far from the town of Osuma. In 938 Ramiro invaded Aragon, or 'Thagher' (as that province was then called by the Arabs), and laid siege to its capital, Saragossa, which he would have reduced if the governor had not hastened to pay him homage and acknowledge himself a feudatory of his crown; though these advantages seem to have been counterbalanced by the victory gained by the Mohammedans over his troops in 938, near a village called Sotuscobas. Ramiro was again victorious in a battle fought under the walls of Ramora, in which the Moslems, according to their own authorities, lost upwards of 40,000 men. Ramiro, like most of his predecessors, had often to contend with internal enemies. Scarcely had he ascended the throne when his brother Alfonso, growing weary of monastic life, forsook his cell, and with a considerable force hastened to Leon to reclaim his throne. He was there invested by Ramiro, who compelled him to surrender, and again consigned him to his monastery, where he was soon after deprived of his eyes. The dependent count of Castile, Ferran-Gonzalez, and Diego Nuñez, a count also in the same province, next revolted against Ramiro, but he marched against them, seized their persons, and confined them to a dungeon; though he soon after pardoned them, and even married his eldest son Ordoño to Urraca, daughter of Ferran. Ramiro died on the 5th of January 950; having some time before his death abdicated in favour of his son Ordoño, and, assuming the penitential garb, passed the remainder of his days in religious retirement.

RAMLER, KARL WILHELM, a lyric poet, translator, and critic, was born at Kolberg in Prussian Pomerania, on February 15, 1725. He was educated at the University of Halle, and in 1748 was made professor of fine arts to the cadet corps in Berlin, which office he held till 1790, when he resigned it in order to devote himself more entirely to the management of the Berlin national theatre, which he had undertaken in 1787. He retired from all business in 1796, and died on April 11, 1798. His works do not display any great poetical genius, but have the merit of correctness, refined taste, and purity of language. He translated Martial, Catullus, and Horace. Among his original poems the most successful is 'The Death of Jesus,' and some other lyrical productions. A collection of his poetical works was published in 1800-1, in two volumes.

RAMMOHUN ROY, Rajah, was born about 1774, in the district of Burdwan, in Bengal, Hindustan. His paternal ancestors were Brahmins of a high order, and were devoted to the religious duties of their race, till about the beginning of the 17th century, when they gave up spiritual exercises for worldly pursuits. His maternal ancestors, also of high Brahminical rank, and priests by profession as well as by birth, uniformly adhered to a life of religious observances. Rammohun Roy was taught Persian under his father's roof, was sent to Patna to be instructed in Arabic, and afterwards, at the request of his maternal relations, went to Benares, in order to acquire the Sanskrit.

A Brahmin by birth, Rammohun Roy was trained by his father in the doctrines and observances of his sect; but his opinions seem to have become heretical at an early age. "When about the age of sixteen," he says, "I wrote a manuscript calling in question the validity of the idolatrous system of the Hindus. This, together with my known sentiments on that subject, having produced a coolness between me and my immediate kindred, I proceeded on my travels, and passed through different countries, chiefly within, but some beyond, the bounds of Hindustan. When I had reached the age of twenty my father recalled me, and restored me to his favour." Afterwards he says, "My continued controversies with the Brahmins on the subject of their idolatry and superstition, and my interference with their custom of burning widows, and other pernicious practices, revived and increased their animosity against me; and through their influence with my family, my father was again obliged to withdraw his countenance openly, though his limited pecuniary support was still continued to me." His father died in 1803, and he then published various books and pamphlets against the errors of the Brahmins, in the native and foreign languages. "The ground which I took in all my controversies was, not that of opposition to Brahminism, but to a perversion of it; and I endeavoured to show that the idolatry of the Brahmins was contrary to the practice of their ancestors, and to the principles of the ancient books and authorities which they professed to revere and obey." In order to deprive him of caste, the Brahmins commenced a

suit against him, which, after many years of litigation, was decided in his favour.

Of the body of Hindu theology comprised in the Vedas there is an ancient extract called the 'Vedant, or the Resolution of all the Veds,' written in Sanskrit. Rammohun Roy translated it into Bengalee and Hindustanee, and afterwards published an abridgment of it for gratuitous circulation; of this abridgment he published an English translation in 1816. He afterwards published some of the principal chapters of the Vedas in Bengalee and English. He was at different times the proprietor or publisher of newspapers in the native languages, in which he expressed his opinion freely against abuses, political as well as religious, especially the burning of widows. In conjunction with Dwarkanath Tagore and Neel Rutton Holdar, he was proprietor of the 'Bengal Herald,' an English newspaper. Dwarkanath Tagore, an enlightened Hindoo, of liberal opinions, very rich, and a munificent benefactor to schools and charities, was born in 1795, in or near Calcutta, and died in London, on the 1st of August 1846. In 1820 Rammohun Roy published, in English, Sanskrit, and Bengalee, a series of selections from the New Testament, entitled 'The Precepts of Jesus the Guide to Peace and Happiness.' In this selection he omits the miracles and doctrinal parts, and confines himself to the simple religious and moral precepts. In 1830 he was engaged by the King of Delhi to make a representation of grievances to the British government, for which purpose the king conferred on him by firman the title of Rajah, and appointed him ambassador to the British court. He arrived at London in April 1831. The British ministers recognised his embassy and title, though the Court of East India Directors objected to both. His negotiation was successful, and added 30,000*l.* a year to the income of the king. He intended to return to India in 1834, but he was taken ill when on a visit at Stapleton Grove, near Bristol, where he died on the 27th of September 1833. He was buried in a shrubbery of Stapleton Grove, without a pall over the coffin and in silence. The Christian observances were carefully avoided at his own request, lest it should be made an accusation against him by the Brahmins, and, by causing him to lose caste, deprive his children of their inheritance.

Rammohun Roy was acquainted more or less with ten languages—Sanskrit, Arabic, Persian, Hindustanee, Bengalee, English, French, Hebrew, Latin, and Greek. Sanskrit and Arabic he knew critically, and as a scholar; Persian, Hindustanee, Bengalee, and English he spoke and wrote fluently; of the other languages his knowledge was less perfect. He associated a good deal with the Unitarians in this country, and frequently attended their chapels. He was a believer in the divine mission of Christ, and seems to have considered the acceptance of the doctrines of Christ to be quite consistent with a belief in the Brahminical religion as it is in the ancient Sanskrit authorities.

(*Review of the Labours, Opinions, and Character of Rajah Rammohun Roy*, by Lant Carpenter, LL.D.)

RAMSAY, ALLAN, was born in 1685, of parents of the humblest class, at a small hamlet or settlement of a few cottages on the banks of the Glangonar, a tributary of the Clyde, among the hills that divide Clydesdale and Annandale. His father is said to have been a workman in Lord Hopeton's lead-mines, and he himself to have been employed when a child as a washer of ore. When he made his first appearance in Edinburgh, about the beginning of the last century, Allan was apprenticed to a barber; and he appears to have followed that trade for some years. In course of time however he exchanged it for that of a bookseller, led probably by a taste for reading which he had acquired. He seems to have early in life enjoyed considerable popularity as a boon companion, and we may presume that it was in this character that he first gave proof of his poetic talents. He gradually however obtained the acquaintance of many of the most distinguished persons both in the literary and fashionable circles of the Scottish capital; and in 1721 he published a volume of his poems, which was very favourably received by his countrymen. In 1724 he published in two small volumes 'The Evergreen, being a Collection of Scots Poems, wrote by the Ingenious before 1600.' The materials of this collection were chiefly obtained from the volume called the Bannatyne Manuscript, preserved in the Advocates' Library; but Ramsay, who had little scholarship, and who lived in a very uncritical age as to such matters, has paid no attention to fidelity in making his transcripts, patching and renovating the old verses throughout to suit his own fancy. 'The Evergreen' was followed the same year by 'The Tea-Table Miscellany, or a Collection of Choice Songs, Scots and English,' in 4 vols., which has been often reprinted. This collection, besides many new verses contributed by Ramsay himself and some of his friends, contains numerous old Scottish songs, which, he observes in his preface, "have been done time out of mind, and only wanted to be cleared from the dross of blundering transcribers and printers." His scouring however went the length in many cases of rubbing away the old song altogether; and his substitutions are by no means always a compensation for what he thus destroyed, though most of them are clever and spirited, and have acquired general currency among Scottish song-singers. Ramsay afterwards wrote many more verses in his native dialect; but his only two original performances of any considerable pretension are his comic pastoral, the 'Gentle Shepherd,' published in 1729, and his continuation of the old Scottish poem of 'Christ's Kirk on the Green.' There is a good deal of rather effective though coarse

merriment in the latter attempt. The 'Gentle Shepherd' is, as a whole, not very like anything else that Ramsay has written; but there seems to be no evidence for the notion which has been suggested, that in this instance he fathered the production of some other writer. The poem, although more careful and elaborate than anything else that Ramsay has left us, is not without the wonted qualities of his manner, both good and bad. It has no more elevation and refinement than any of Ramsay's other works, though less that is offensively coarse or boisterous than some of them; both in the diction and the thought it flows easily and smoothly; and though there are not many happy touches, and no daring strokes, there is a general truth of painting about it in a quiet tone which is very soothing and agreeable. It has also some humour, which however is rather elaborate and constrained.

Ramsay died in 1758, leaving a son, the subject of the following article, who acquired distinction as a portrait-painter.

RAMSAY, ALLAN, the son of Allan Ramsay the poet, was born in 1713, at Edinburgh. Although in the first instance self-taught, he afterwards studied for a short time in Italy with Solimena and F. Fernandi, called Imperiali. After practising a short time in Edinburgh he settled in London, where he was introduced by Lord Bute to George III. when prince of Wales. He painted two portraits of the prince, which were engraved, one by Ryland and the other by Woollett. At the death of Mr. Shakelton, in 1767, Ramsay succeeded him as principal painter to the king; he retained the place until his death, when he was succeeded by Sir Joshua Reynolds. He died at Dover in 1784, on his return from a fourth visit to Rome. He had a daughter, who was born in Rome. Ramsay, though not a good portrait-painter, was superior to the generality of the painters before Reynolds. Edwards says that Ramsay was not devoted to his art; he allowed literature to divide much of his time with it. He was acquainted with Latin, French, and Italian; and in his latter days acquired some knowledge of Greek. He was the author of some political papers. He was twice married: his second wife was a daughter of Sir David Lindsay. His son and daughter survived him: the son became a general in the British army; the daughter was married to Sir Archibald Campbell.

RAMSAY, ANDREW MICHAEL, generally known as the Chevalier Ramsay, was born at Ayr, in Scotland, in 1686. He was educated at Edinburgh, where he chiefly devoted himself to the study of mathematics and theology. The distinction he obtained as a scholar procured for him the appointment of tutor to the son of the Earl of Wemyss at the University of St. Andrews. Having entertained some doubts respecting the tenets of the Protestant faith, he went to Holland for the purpose of visiting a Protestant divine of the name of Poiret, who had obtained a certain celebrity as one of the leaders of the Quietist party. With him Ramsay entered into a religious controversy, the fruits of which were an increase of his doubts and even an inclination to general scepticism on the great doctrines of the Christian religion. In this state of mind he determined on having recourse to Fénelon, who was at that time residing in his diocese of Cambray. Fénelon in a short time made him a convert to the Roman faith. He soon became the disciple of Fénelon, not only in religious matters, but also in his literary taste and opinions. His writings were formed on the style and after the manner of his great master, and he rapidly acquired so perfect a knowledge of the French language as to become an excellent writer. Some of his earlier productions were the means of obtaining for him the situation of tutor to the Duke of Chateau Thierry and afterwards to the Prince of Turenne; he was also created a knight of the order of St. Lazarus. His reputation induced the Pretender, in 1724, to invite him to Rome, and to entrust him with the education of his children. He remained however only a year in that city, and left it in disgust with the petty intrigues which he found to form the principal occupation of the miniature court of the son of the exiled king. The next year he revisited Scotland, where he remained a considerable time, which he employed in literary labour. On visiting England he obtained, through the influence of Dr. King, the degree of Doctor of Civil Law in the University of Oxford; he was also admitted a member of the Royal Society of London. After his return to France he was appointed intendant to the Prince of Turenne, who afterwards became the Duke of Bouillon: he held this situation till his death, which took place at St. Germain-en-laye in 1743.

The writings of the Chevalier Ramsay are more remarkable for the purity of their style and the perfect knowledge which they manifest of the French language, than for their depth or originality of thought. As a theologian he was visionary in the extreme, and his orthodoxy, even according to the principles of the church he had adopted, is open to considerable suspicion. It is said to be fortunate for his religious reputation that he did not live to publish some philosophical works which he was preparing, such as his answer to Spinoza, and a treatise on the Progress of Human Understanding. The work by which he is best known, is his 'Voyages de Cyrus,' a somewhat feeble imitation of the Telemachus of Fénelon. The character of Zarina gave considerable offence to the Princess de Conti, one of the most learned ladies of the age, who imagined that she was portrayed in it. There is an excellent translation of that work, by Hooke, though said to have been accomplished in the short space of twenty days [HOOKE, NATHANIEL]; it was for a long time mistaken for an original,

the general belief respecting it being that Ramsay had written the *Voyages of Cyrus* in English as well as in French. The best edition of the French is that of 'Paris et Londres,' 2 vols. 8vo, 1727. The work however for which posterity is most indebted to him is that entitled 'L'Histoire de la Vie de François de Salignac de la Motte Fénelon,' Hague, 1723; published also in London the same year. His great intimacy with Fénelon has made us acquainted with many interesting facts of his private life, and it contains a valuable record of his opinions. His other published writings are—1. 'Discours sur le Poème Épique,' originally forming the preface of his edition of Telemachus, in 1717. 2. 'Essai Philosophique sur le Gouvernement Civil,' London, 1721; it was afterwards reprinted under the title 'Essai de Politique.' 3. 'Histoire de Turenne,' Paris, 1735, 2 vols. 8vo, and 4 vols. 12mo. With some affectation in the style, and a redundancy of reflections, this history possesses much merit from the precision of its facts and the lively portraiture of its characters. 4. 'Le Psychomètre, ou Reflexions sur les différens Caractères de l'Esprit, par un Mylord Anglais.' 5. A posthumous work published at Glasgow in 1749, 2 vols. 12mo, in English, entitled 'Philosophical Principles of Natural and Revealed Religion explained and unfolded in a Geometrical Order.'

RAMSDEN, JESSE, was born at Salterhebble, near Halifax, Yorkshire, 1735. He was the son of an innkeeper. When nine years old he was admitted into the free grammar-school of Halifax; and after attending there for about three years, he was placed under the protection of an uncle, who resided in the north of Yorkshire. By him he was sent to a school conducted by Mr. Hall, a clergyman, who was in repute as a teacher of the mathematics, and under whom he attained to some proficiency in geometry and algebra. His studies were interrupted by his father apprenticing him to a cloth worker at Halifax.

At the age of twenty we find him engaged as a clerk in a cloth warehouse in London, in which capacity he continued till 1757-58, when his predilection for other pursuits led him to bind himself for four years to a working mathematical and philosophical instrument maker, named Barton, in Denmark Court, Strand. Upon the completion of his term, he engaged himself as assistant to a workman, named Cole, at a salary of twelve shillings a week; but this connection was of short duration. He then commenced working on his own account, and his skill as an engraver and divider gradually recommended him to the employ of the leading instrument makers, more particularly Nairne, Sisson, Adams, and Dollond. Ramsden subsequently married Dollond's daughter, and he received with her a part of Mr. Dollond's patent right in achromatic telescopes. His occupation afforded him frequent opportunities of observing the defective construction of the sextants then in use, the indications of which, as had been pointed out by Lalande, could not be relied on within five minutes of a degree, and might therefore leave a doubt in the determination of the longitude amounting to fifty nautical leagues. The improvements introduced by Ramsden are said by Piazzi to have reduced the limits of error to thirty seconds. ('Account of the Life and Labours of Ramsden' in a Letter addressed to Lalande, and published by him in 'Journal des Sçavans,' November 1788, p. 744.) This circumstance, added to the cheapness of his instruments, which were sold for about two-thirds the price charged by other makers, soon produced a demand which, even with the assistance of numerous hands, he found difficulty in supplying. In his workshops the principle of the division of labour was carried out to a considerable extent, and a proportionate dexterity was acquired by the workmen; but it is asserted that in none of these, even the most subordinate, and least of all in the higher departments, did the skill of the workmen surpass that of Ramsden himself. His attention was incessantly directed to new improvements and further simplification, the result of which was the invention of a dividing-machine, for the graduation of mathematical and astronomical instruments. The date of this invention is prior to the year 1766. At first it had many imperfections; but by repeated efforts of ingenuity throughout a period of ten years they were successfully removed. In 1777 it was brought under the notice of the Commissioners of the Board of Longitude, by Dr. Shepherd, and by them a premium of 615*l.* was paid to the author, upon his engaging to divide 'sextants at six, and octants at three shillings, for other mathematical instrument makers.' A description of the machine was immediately published, by order of the Board, under the supervision of Dr. Maskelyne (London, 1777, &c.), and was shortly after translated into French by Lalande. A duplicate of the machine itself is said to have been purchased by the president, Bochart de Saron, and introduced into France concealed in the support of a table made for that purpose. (Weiss, 'Biog. Univers.') As early as 1788 no less than 983 sextants and octants had issued from Ramsden's workshop. In 1799 the description of another machine constructed by Ramsden for dividing straight lines by means of a screw was also published by order of the Board: but this invention does not appear to have been of much practical use. It was however in the construction of many of a larger class of astronomical instruments that Ramsden acquired most reputation, though they were probably least productive of pecuniary gain. The theodolite employed by General Roy in the English Survey was made by Ramsden, and no instrument of the kind that had been previously made would bear comparison with it. A similar remark is applicable to the equatorial constructed for Sir George Schuckburgh, which was

also the largest that had then been attempted. Ramsden took out a patent for his new equatorial, and a description of it was published by the Hon. Stewart Mackenzie, brother to the Earl of Bute; but his inventive genius seldom permitted him to construct two instruments alike. His telescopes, erected at the observatories of Blenheim, Mannheim, Dublin, Paris, and Gotha, were remarkable for the superiority of their object-glasses; and in his mural quadrants, furnished to the observatories of Padua and Vilna, Dr. Maskelyne was unable to detect an error amounting to two seconds and a half, a degree of accuracy which was then a matter of admiration among astronomers. Ramsden however always recommended that the mural quadrant should be superseded by a mural circle; and the circles erected in the observatories of Palermo and Dublin, the first of which was of five and the latter of twelve feet diameter, were constructed by him in accordance with this recommendation.

Among Ramsden's minor inventions and improvements may be enumerated his catoptric and dioptric micrometers (described in the 'Phil. Trans.,' 1779), the former of which was an improvement upon that of Bouquier; optigraph; dynamometer (for measuring the magnifying powers of telescopes); barometer; electrical machine; manometer; assay-balance; level; pyrometer; and the method introduced by him for correcting the aberrations of sphericity and refrangibility in compound eye-glasses. ('Phil. Trans.,' 1783.)

Ramsden was elected a fellow of the Royal Society in 1786. In 1794 a similar compliment was paid him by the Imperial Academy of St. Petersburg; and the following year the Copley medal was awarded to him by the Royal Society, in testimony of the importance of his various inventions. By this time his health had become much impaired by his ardent devotion to his profession. In 1800 he was advised to visit Brighton, where he died, on the 5th of November of that year. From 1766 to 1774 his shop and residence was in the Haymarket; but in the latter year he removed to Piccadilly, where his business continued to be conducted after his decease.

In his habits we are told that he was temperate to abstemiousness, and that for many years he restricted himself to very few hours of repose. Most of the time that he could spare from the immediate duties of his profession was devoted to the perusal of the works of science and literature. His memory was remarkably retentive, and at an advanced age he made himself sufficiently master of the French language to read Molière and Boileau. The fortune of which he died possessed was not considerable, and a large portion of it was directed by his will to be distributed among his workmen.

RAMUS, PETER (PIERRE DE LA RAMÉE), was born in a village in Picardy, in 1502 according to one account, and in 1515 according to another. His parents were extremely poor, and the future philosopher was set when a boy to tend sheep. Disgusted with this employment, he ran away from his parents to Paris. After some time, and after he had encountered much misery, one of his uncles offered some pecuniary assistance, and Ramus now entered the College of Navarre as a servant. He made great progress in all studies, with very little assistance from masters. At the completion of his course, when he presented himself for the degree of master of arts, he undertook as an exercise what then seemed the almost impious task of showing that Aristotle was not infallible. The exercise was adjudged successful, and Ramus henceforth devoted himself to the study of the works of Aristotle as to the object of his life. In 1543 he published his new system of logic, with strictures on the logic of Aristotle. The publication of this work exposed him to great obloquy. He was charged with impiety and sedition, and with a desire to overthrow all science and religion through the medium of an attack on Aristotle. On the report of an irregular tribunal appointed to consider the charges made against him, the king ordered his works to be suppressed, and forbade his teaching or writing against Aristotle on pain of corporal punishment. Ramus now turned to the study of mathematics, and to prepare an edition of Euclid. Shortly afterwards he began a course of lectures on rhetoric at the College of Presles, the plague having driven away numbers of students from Paris. He was named principal of this college, and the Sorbonne ineffectually endeavoured to eject him on the ground of the royal prohibitory decree. This decree was cancelled in 1545 through the influence of the Cardinal de Lorraine, to whom he had dedicated his edition of Euclid. He now began a course of mathematics in Paris. In 1551 he was named by the king (Henri II.) professor of philosophy and eloquence in the College of France. During the next ten years he published a Greek, Latin, and French grammar, and several treatises on mathematics, logic, and rhetoric. Ramus had embraced Protestantism, and now shortly again brought upon himself great trouble by the zeal with which he advocated the new doctrines. Charles IX. offered him an asylum at Fontainebleau; but, while he was absent from home, his house was pillaged and his library destroyed. He returned to Paris in 1563, and resumed possession of his royal chair. Civil troubles again drove him away from Paris, and in 1568 he asked permission to travel. He went to Germany, and was received everywhere with honour. He gave lectures on mathematics at Heidelberg, and while in this town he made public profession of Protestantism. Shortly after his return to Paris he fell a victim in the massacre of St. Bartholomew.

Although Ramus had many merits as a philosopher, and did much good by his opposition to the Aristotelian philosophy which then

held men's minds in bondage, he was wanting in depth and caution, and his strictures on Aristotle are by no means altogether just. He had many followers. The influence of Melanchthon, on the other side, did not prevent the progress of his system of logic in the German universities. France, England, and particularly Scotland, were full of Ramista. Andrew Melville introduced the logic of Ramus at Glasgow.

The following is a list of the principal works of Ramus:—1, 'Institutiones Dialecticæ Tribus Libris distinctæ'; 2, 'Animadversiones in Dialecticam Aristotelis'; 3, 'Rhetoricæ Distinctiones in Quintilianum'; 4, 'Arithmetica Libri Tres'; 5, 'In Quatuor Libros Georgicorum et in Bucolica Virgili Prælectiones'; 6, 'Ciceronianus' (a life of Cicero, interspersed with many philological remarks on the Latin language, and strictures on the state of education in France); 7, 'Scholæ Grammaticæ Libri Duo'; 8, 'Grammatica Latina'; 9, 'Grammatica Græca quatenus à Latina differet'; 10, 'Gramère Fransoeze'; 11, 'Liber de Moribus Veterum Gallorum'; 12, 'Liber de Militia Julii Caesaris'; 13, 'Commentarius de Religione Christiana, Libri Quatuor'; 14, 'Præfationes, Epistolæ, Orationes' (Paris, 1599, and Marburg, 1599). The Greek grammar of Ramus received considerable additions from Sylburgius. For a complete list of the works of Ramus the reader is referred to Nicéron ('Mém.', tom. xiii.).

RAMUSIO, GIAMBATTISTA, was born at Treviso in the Venetian State, in 1485, of a family originally from Rimini, which produced several men of learning. He filled several offices under the republic, and became secretary to the Council of Ten. Having undertaken a collection of the most important narratives of voyages and travels performed in distant countries both in ancient and modern times, he translated into Italian those that had been written in other languages, and added his own remarks and several dissertations, which show that he possessed very extensive general information for the age in which he lived. He was a friend of Bembo, Fracastoro, and other learned contemporaries. His work is entitled 'Raccolta di Navigazioni e Viaggi', 3 vols. fol. The first volume was printed by Giunti at Venice in 1550, another volume appeared in 1556, and a third in 1559, after Ramusio's death, which took place at Padua in July 1557. Subsequent editions appeared with the addition of several travels which had not appeared in the first. The most complete edition is that of 1606. The following list of contents will convey an idea of the value of the work:—

Vol. i.: "Leo Africanus's Description of Africa; Cadamosto, a Venetian navigator, preceded by a Discourse by Ramusio; Sintra, a Portuguese narrative; Hanno's Periplus; Navigation from Lisbon to St. Thomé, by a Portuguese pilot; Ramusio, a Discourse on the Navigation of the Portuguese to the East Indies; Voyage of Vasco de Gama in 1497, written by a Florentine; Pedro Cabral Alvarez, voyage from Lisbon to Calicut in 1500, written by a Portuguese pilot; Amerigo Vespucci, two letters to Pietro Soderini; a Summary of Vespucci's Voyages; Thomas Lopez, a Portuguese, Voyage to the East Indies; Giovanni da Empoli, a Florentine, Journey to India; Ludovico Barthema of Bologna, Itinerary, preceded by a Discourse by Ramusio; Iambolus, Voyage extracted from Diodorus, with a Discourse by Ramusio; Andrea Corsali, a Florentine, Two Letters to Julian and Lorenzo de' Medici; Alvarez, Travels to Ethiopia, with the submission of Prester John to Pope Clement VII.; Ramusio, Discourse on the Rise of the Nile, with a reply by Fracastoro; the Voyage of Nearchus translated from Arrian's text; Journey of a Venetian from Alexandria to Diu in India in 1538; Arrian's Navigation from the Red Sea to India; Barbosa, a book of travels to the East Indies; a brief account of Kingdoms and towns between the Red Sea and China, translated from the Portuguese; Antonio Conti, a Venetian, Journey to India, written by Poggio Bracciolini; Jeronimo da San Stefano, a Genoese, his letter written from Tripoli in 1499; Ramusio, Discourse on the Voyage round the World by the Spaniards; Maximilian of Transylvania, Epistle concerning the Navigation of the Spaniards; a short account of the Voyage of Magalhaens; Pigafetta, Voyage round the World; the Navigation of a Portuguese who accompanied Edward Barbosa in 1519; Ramusio, a Discourse concerning the Voyages to the Spice Countries; Juan Gaetan, a Castilian pilot, Discovery of the Moluccas; Information concerning Japan, by the Portuguese Jesuits; João de Barros, Chapters extracted from his History."

Vol. ii. contains "Marco Polo's Travels, with a preface by Ramusio; Hayton, an Armenian, Discourse on the origin of the Great Khan and the condition of the Tartars; Angiolelli, Life and Actions of Hussan Cassan; the Travels of a Merchant into Persia in the years 1517-20; Giosafat Barbaro, a Venetian, Journey to the Tana (the river Tanais) and into Persia; Ambrosio Contarini, Journey into Persia; Alberto Campense, Letters to Clement VII. concerning the affairs of Muscovy; Paul Giovio, Reports on the affairs of Muscovy, by him collected; Herbestein, Commentaries on Muscovy and Russia; Arrian's Letter to Hadrian concerning the Euxine; Interiano, a Genoese, on the Habits and Manners of the Zythi, called Circassians; Hippocrates, extract of his Treatise on Air and Water, in which he speaks of the Scythians; Piero Quirino, a Venetian, account of his Voyage and Shipwreck; Sebastian Cabota, Navigation in the Northern Seas; Caterino Zeno, a Venetian, Travels to Persia; Nicolo and Antonio Zeno on the Discovery of Iceland; Travels into Tartary by some Dominican Monks; Olderico da Udine, Two Journeys into Tartary; Guagnini, a Venetian,

Description of European Sarmatia; Matthew Mischeow of Cracow, Description of the Two Sarmatias."

Vol. iii.:—"Pietro Martire of Angleria, extract from his History of the New World; Oviedo, extract from his History of the West Indies; Herman Cortez, Narrative of his Conquest of Mexico; Pedro de Alvarado, two letters to Herman Cortez; Diego Godoy, a letter from New Spain; Narrative of one of Cortez's companions concerning Mexico, with two maps, one of the Great Temple, and another of the Lake; Alvaro Nuñez, Narrative of the Indies and of New Galicia in 1527-36; Guzman on the Conquest of New Spain; Francisco Ulloa, Voyage in the Mar Vermejo, or Sea of California; Vasquez de Coronado, Narrative of a Journey to Cevole, or the Kingdom of the Seven Cities; Alarcon, Voyage to discover the Kingdom of the Seven Cities in 1540; Ramusio, Discourse on the Conquest of Peru; Narrative of a Spanish Captain concerning the Conquest of Peru; Francisco Xeres, Narrative of the Conquest of Peru and New Castile; Narrative of a Secretary of Francisco Pizarro concerning the Conquest of Peru; Gonzalo de Oviedo, Navigation of the river Marañon; Ramusio, Discourse concerning New France; Giovanni da Verazzano, a Florentine, Narrative written from Dieppe, in July 1524; Discourse of a great Naval Captain concerning the Navigation of the West Indies; Jacques Cartier, First and Second Narrative of Voyages to New France; Cesare de Federici, Voyage to the East Indies and beyond India; Three Voyages of Hollanders and Zealanders to China, New Zembla, and Greenland."

Among the above series are several curious narratives which are not found in any other collection. Ramusio left materials for a fourth volume, which unfortunately were destroyed in a fire which broke out in the printing-press of Giunti, in November 1557.

RANDOLPH, THOMAS, an English poet, was born in 1605, at Badby in Northamptonshire. He was educated at Westminster School, and thence elected scholar of Trinity College, Cambridge, in the year 1623; was afterwards made Fellow on the same foundation, and was admitted to an *ad eundem* degree at Oxford in 1631. After some stay at Cambridge he came to London, where he was much noticed by Ben Jonson, who called him 'son.' He became intimate also with many of the other wits of that day. The promise of his youth was marred by a career of dissipation and extravagance, which shortened his life prematurely. He died while on a visit to a friend at Blatherwick in Northamptonshire, where he was buried, on the 17th of March 1634-35, and his memory honoured by a monument erected by Sir Christopher (afterwards Lord) Hatton of Kirby.

Randolph's 'Poems, Translations, and Plays,' were published in London, 4to, 1634; and his 'Poems, with the Muses' Looking-Glass and Amyntas,' at Oxford, 4to, 1638. There have been several other editions published since, both in London and at Oxford. His plays are—'Aristippus,' and 'The Conceited Pedlar,' published together in 1630, 4to; 'Jealous Lovers,' 4to, 1632; 'The Muses' Looking-Glass,' 4to, Lond., 1638; 'Amyntas,' Oxford, 1638; 'Hey for Honesty, Down with Knavery,' a comedy, 'The Prodigal Scholar,' a comedy, and 'The Dolium Cornelianum,' a Latin play in the style of Plautus, have been attributed to him.

Randolph's writings are the production of a mind well imbued with classical literature, and he has in many passages not unskillfully interwoven the language and imagery of the best authors of antiquity. He wrote Latin verse with ease and fluency, and translated from Claudian with considerable elegance; but his English compositions are not free from the faults imputed to most of his contemporaries, and are often disfigured by licentiousness, obscurity, and strained conceits, exhibiting more learning and ingenuity than good taste. They consist of addresses to different friends, epigrams, translations, and amatory pieces. His dramas present few attractions to modern readers. The characters are either mere impersonations of virtues and vices, or feeble and pedantic travesties from Greek and Roman comedy. The plots are perplexed and devoid of interest, and the dialogue seldom rises above mediocrity. The most popular of his plays is the 'Muses' Looking-Glass,' which was re-acted in the last century.

RANGABE, A. R. [RIZO RANGABE.]

RANG'ONE, a noble family of Modena, which became illustrious in the middle ages, not only for the part which it took in the political and military vicissitudes of Italy, but more particularly for the patronage which it gave to learning and to the learned. Count Nicolò Rangone, who lived in the latter part of the 15th century, was the father of eight sons and two daughters, whom he caused to be instructed with great care, and all of whom became distinguished for their love of science and literature. The learned Visdomini, who was preceptor to several of them, has left an interesting memorial of the care bestowed on their education in his dialogues entitled 'Antonii Maria Visdomini de Ocio et Sybilia.' One of his pupils, Count Guido Rangone, figured as a distinguished general in the Venetian service, and afterwards in the service of King Francis I. Filelfo, in his book 'De Optima Hominum Felicitate,' which he addressed to Count Guido, enumerates the feats he had performed in his military career, and praises him likewise for the liberal encouragement which he afforded to the learned. Bernardo Tasso, father of the great poet, was for a long time secretary to Count Guido. Guido died at Venice in 1537. His brother, Cardinal Ercole Rangone, who died young during the pillage of Rome in 1627, is likewise extolled for his love of learning.

by Giglio Giraldi, and also by Vida, in his second book, 'De Arte Poetica.' Costanza Rangone, sister of the preceding, took for her second husband Cesare Fregoso, a well-known Genoese emigrant in the service of Francis I., who was murdered in 1541 by the emissaries of the Marquis del Vasto, governor of Milan for Charles V. She then retired to France, together with Bandello, the celebrated novelist, who wrote many of his tales for her entertainment. Ginevra Rangone, sister of Costanza, married first a nobleman of the Correggio family, and afterwards Luigi Gonzaga, marquis of Castiglione. She has been praised by Scaligero for her intellectual accomplishments. Her nephew, Count Fulvio Rangone, a pupil of Carlo Sigonio, was employed by Alfonso II. of Este in a diplomatic capacity; and his sister Claudia fixed her residence at Rome, where she enjoyed considerable interest at the Papal court, and was even consulted on matters of state.

\*RANKE, LEOPOLD, one of the most distinguished of the historians produced in modern times by Germany, was born on December 21, 1795, at Wiehe, on the Unstrutt, near Naumburg in Prussian-Saxony. Early in life he became a teacher, and in 1818 was appointed upper-master of the gymnasium at Frankfurt-on-the-Oder, but devoted all his leisure to the study of history. The first fruits of his labours were a 'History of the Roman and German People, from 1494 to 1535,' and a 'Critique on modern Historical Writers,' both published in 1824. These, especially the latter, a clear and discriminating essay on the qualities to be desired in a historian, attracted so much attention that he was appointed professor extraordinary of history in the University of Berlin in 1825. Soon after entering on the duties of his new office, he visited, at the expense of the government, Vienna, Venice, and Rome, where he found abundant materials both in public and private collections, among which the ambassadorial despatches to the Venetian senate were of peculiar value. From those materials he produced in 1827 'Fürsten und Völker von Süd-Europa im 16 und 17 Jahrhundert' ('Princes and Nations of South-Europe in the 16th and 17th Centuries'); and the 'Verschwörung gegen Venedig im Jahr 1688' ('the Conspiracy against Venice in 1688') published in 1831. Both works were of distinguished excellence, containing the results of zealous industry, much of novelty in the relations of the Spanish and Turkish governments with the affairs of Italy, a remarkable and original talent for the development of individual character and for the grouping of events, an integrity that could be thoroughly relied upon, and a lucid and easy style. His reputation was even increased by his next work, 'The Popes of Rome; their Church and State,' which was published in 3 vols. in 1834-36; more than half of the last volume consisting of original documents. Of this work an excellent translation has been given to the English public by Mrs. Austin, in 1840, another by E. Foster, in 1848, and a third by Mr. Scott, with an introductory essay by Merle d'Aubigné, in a less impartial spirit than that in which the author writes, appeared in 1846, as "more adapted for extensive circulation." In 1832 he had commenced as editor the 'Historical and Political Gazette,' ('Historische-Politische Zeitschrift'), which, as containing too liberal views of the necessity of continued progress, he was forced to discontinue in 1836, when only two volumes had been completed. In 1837 he read and afterwards published a discourse to the Royal Scientific Academy at Berlin on the History of Italian Poetry. Between 1837 and 1840 he published three volumes of 'Annals of the German Monarchy under the House of Saxony.' In 1834 he had been promoted to be ordinary professor of history in the University of Berlin, and in 1841 he was created historiographer of Prussia. He has since issued 'Neun Bücher Preussische Geschichte,' which has been translated by Sir A. and Lady Duff Gordon, under the title of 'Memoirs of the house of Brandenburg, and History of Prussia during the 17th and 18th Century,' as have likewise a 'History of Servia and the Servian Revolution, with a Sketch of the Insurrection in Bosnia,' ('Die letzten Unruhen in Bosnien') 'Civil Wars and Monarchy in the 16th and 17th Centuries; a History of France principally during that period; Ferdinand I. and Maximilian II. of Austria; an essay on the political and religious state of Germany, immediately after the Reformation,' this last being a short essay, published in the 'Zeitschrift,' and 'the Ottoman and the Spanish Empires,' which formed a part of the 'Princes and Nations of South-Europe.' In Germany the work most highly praised is however his 'Deutsche Geschichte im Zeitalter der Reformation,' of which three volumes were issued between 1839 and 1843, and which have been translated by Mrs. Austin, under the title of 'History of Germany during the Reformation.'

RANZANI, CAMILLO, ABBATE, an eminent naturalist, was born at Bologna, June 22, 1775. Being of a very humble family, he received his first education in the charity-school of the Brethren of the Scuole Pie in that city, where his talents attracted the notice of a benevolent priest of the Oratory, Father Respighi, to whom literature owes a similar debt for the discovery and patronage of the youthful linguist, Mezzofanti. Ranzani having through the assistance of Respighi entered the University of his native city, distinguished himself so much in his philosophical course that, even before he had completed his studies, he was occasionally employed by the professor Giuseppe Vogli as his substitute; and when he was but twenty-two years of age he was selected to fill the chair of philosophy at Fano. There, having received holy orders, he taught with reputation until in 1798 the

political disturbances of the Legations compelled him to return to Bologna, where he was appointed keeper of the botanical gardens of that city. Some of his papers on botany, which were read at the Institute, having attracted notice, he was named professor of natural history in the university in 1803. He himself confessed that, at the time of his appointment, his general attainments in natural history were far from complete; but from that moment he devoted himself to the study with so much zeal and assiduity that Baron Cuvier, during a visit to Bologna in 1810, was so struck by his ability in that branch of science as to procure for him, on his return to Paris, an authorisation to repair to Paris for the purpose of enjoying the advantages for study, and for the acquisition of specimens, presented by the matchless collections of that city. After a residence of somewhat more than a year, Ranzani returned to Bologna with a considerable collection of books, minerals, fossils, and other appliances of natural history. During the early part of his professorship he had been a frequent contributor to the scientific journals of Italy, France, and Germany, and taken an active part in the proceedings of most of the Italian scientific and literary societies; but it was not till 1819 that he commenced the publication of his great work, 'Elementi di Zoologia.' The first volume, published in that year, contains the general introduction to zoology; the second, on the mammiferous animals, was published in 1820; and was followed in 1821 and the succeeding years by the successive volumes as far as the tenth, at which unhappily the work was interrupted, partly by the ill-health of the author, partly by his occupations as rector of the university, to which office he was named in 1824 by the pope, Leo XII. Though he had already prepared great part of the materials necessary for its completion, and although the many articles contributed by him to various journals of natural history amply demonstrate the extent and accuracy of his knowledge, the work has unfortunately been left in the same incomplete state. In 1836 Ranzani undertook a course of Lectures on Geology, a science which up to that time was regarded with much suspicion in the Italian universities. He had the honour of first introducing to his countrymen the discoveries of Buckland, Lyell, De la Beche, and the other members of the English school; and as he had early made himself familiar with the study of comparative anatomy, he was able to speak, upon the questions which most interested the students of biblical geology, with a degree of authority which a lecturer unacquainted with that subject would not have ventured to assume. His ability in this branch of science had been recognised even at an early period by Cuvier, who freely confessed his obligations to Ranzani for some important information of which he availed himself in his great work, and Ranzani was engaged in preparing for the press a treatise on geology, containing the substance of his lectures during the five years from 1836 till 1841, when he was unexpectedly carried off by illness, April 23, 1841, in the sixty-sixth year of his age. A catalogue of his miscellaneous essays, lectures, dissertations, and contributions to periodical literature, will be found in the 'Memorie di Religione, di Morale, e di Letteratura,' published at Modena, 1843. (*Continuazione*, vol. xv., pp. 401, 402.)

RAOUL-ROCHETTE, DESIRÉ, an eminent French archæologist, was born at St. Arnaud in the department of Cher, on the 9th of March, 1789. Educated at Bourges, he was called to Paris when little more than twenty-two, to fill the chair of history in the Lyceum; and in 1815 he supplied the place of Guizot as lecturer on Modern History in the University of Paris. In 1815 appeared the work which first gained him a more than local celebrity, 'Histoire Critique de l'établissement des Colonies Grecques,' 4 vols. 8vo. The following year he was made member of the Académie des Inscriptions, and one of the editors of the 'Journal des Savants'; and in 1818 he was appointed keeper of the medals, &c., in the Royal Library. His attention having been directed to modern Swiss history he, during the following years, made several exploratory journeys in Switzerland, of which he published ample particulars under the title of 'Lettres sur la Suisse écrites en 1819-21,' 3 vols. 8vo, Paris, 1823-26, and 'Voyage Pittoresque dans la Vallée de Chamouni et autour du Mont Blanc,' 4to, 1826. His 'Histoire de la Révolution Helvétique de 1797 à 1803,' appeared in 1823. But whilst thus engaged on topography and modern history, he was still diligently prosecuting the study of classical antiquity, to which he thenceforward devoted himself, making various journeys to Greece and Sicily, Italy, Germany, Holland, &c., in order to familiarise himself with particular localities and to examine the treasures collected in museums. In 1822 appeared his 'Antiquités Grecques du Bosphore Cimmérien.' He had already come to be looked upon as the legitimate successor of Quatremère de Quincy, before the delivery of his lectures in 1826 on his appointment as professor of archæology, which considerably added to his celebrity. These lectures were published in 1828, under the title of 'Cours d'Archéologie,' and again in 1836.

From this time M. Raoul-Rochette was one of the most active and most widely known of the French writers on ancient art, communicating numerous papers to the Memoirs of the Académie, as well as to the journals of other learned societies, and frequently appearing before the public in distinct works. In 1828 he published 'Monuments inédits d'Antiquité figurée Grecques, Etrusques, et Romaines,' 2 vols. fol. His 'Peintures Antiques inédites' appeared in 1836. In 1839 he was appointed perpetual secretary to the Académie des Beaux

Arts, the post previously held by Quatremère de Quincy; and, like his predecessor, he composed a large number of official eulogies and resumé. In 1840 appeared his 'Mémoires de Numismatique et d'Antiquité,' 4to; in the same year 'Lettres Archéologiques sur la Peinture des Grecs;' and in 1846, 'Choix de Peintures de Pompéi.' His last work of importance—one which he describes in the introduction as having for its object "to direct the investigations of the mythographers and antiquaries of the present day to the only course which, I believe, will prove fruitful in new discoveries—the relationship between Greece and Asia"—was entitled 'Mémoires d'Archéologie comparée Asiatique, Grecque, et Étrusque,' but only one part was published (in 1848), and that, though a bulky 4to volume of 404 pages, is wholly occupied with the 'Premier Mémoire sur l'Hercule Assyrien et Phénicien considéré dans ses Rapports avec l'Hercule Grec.' Except some controversial letters directed to M. Carnot, referring to some charges brought against him in respect of his official conduct, he does not appear to have issued subsequently any separate publications. He died on the 6th of July 1854. An English translation of his 'Lectures on Ancient Art,' by H. M. Westropp, was published in 1854.

RAPHAEL. [RAFFAELLE.]

RAPIN, PAUL DE, a younger son of Jacques de Rapin, Sieur of Thoyras, was born at Castres, in 1661, of a Protestant family, which came originally from Savoy. He studied in the Protestant college of Saumur, and afterwards entered the profession of the law. But the revocation of the Edict of Nantes by Louis XIV. in 1686 drove him from his native country, and he went first to England, and afterwards to Holland, where he entered the service of William of Nassau as a volunteer. He accompanied William to England in 1688, was made an officer in an English regiment, served in Ireland under General Douglas, and was wounded at Limerick. Not long after he was appointed travelling tutor to the young Duke of Portland, with whom he spent several years. Having completed his engagement, he retired with his wife first to the Hague, and afterwards, for the sake of economy, to Wesel, where he commenced his great work, the 'History of England,' which occupied him for seventeen years. The application requisite for this undertaking is said to have exhausted his frame, and he died at Wesel in 1725. His work is entitled 'Histoire d'Angleterre depuis l'Etablissement des Romains jusqu'à la Mort de Charles I.,' 8 vols. 4to, La Haye, 1724, and foll. It was continued by others down to the accession of George II. The work was translated into English by Nicholas Tindal. This translation went through various editions; that of 1757-59 consists of 21 vols. 8vo, and is enriched with additional notes and a biography of Rapin. Rapin writes with spirit and ease: he quotes his authorities; and his work was the only complete history of England existing at the time of its appearance. Rapin wrote also a 'Dissertation sur les Whigs et les Torys.'

RASARIUS, or, more properly, GIAMBATTISTA RASARIO, an Italian physician, was born of a noble family in 1517, in the province of Novara, in the Sardinian territories. After having studied at Milan and Pavia, he took the degree of Doctor of Medicine at the University of Padua. Upon his return to Milan his learning soon gained him so great a reputation that the republic of Venice invited him to their city, where he was professor of rhetoric and the Greek language for two-and-twenty years. Here he distinguished himself by his eloquence, particularly on occasion of the battle of Lepanto, 1571, when, at the command of the doge, and with a very short time for preparation, he pronounced in the church of St. Mark a public oration that has been several times printed. He afterwards went to Rome, where the pope, Pius IV., made him the offer of some good appointments; but he chose rather to accept the office of professor of rhetoric at Pavia, where he died about four years after, in 1578, at the age of sixty-one. His works consisted principally of editions and translations of various Greek writers, such as, 'Galen Comment. in Hippocr. lib. ii. et vi. Morb. Popular., De Alimentis, et De Humoribus,' Cæsaraugustæ (Saragossa), 4to, 1567; 'Oribasii quæ restant Omnia, Tribus Tomis digesta,' 8vo, Basil, 1557; 'Georgii Pachymeris Epitome Logica Aristotelis,' 8vo, Paris, 1547; 'G. Pachym. in Univ. Aristot. Dissertend. Artem Epitome,' with 'Ammonius in Porphy. Inst.' fol., Lugd., 1547; 'Xenocrates de Alimento ex Aquatilibus,' in Fabricii 'Bibl. Gr.' tom. ix., pp. 454-474; 'Joannis Grammatici (sive Philoponi), Comment. in primis iv. Aristot. de Naturali Auscult. Libros,' fol., Venet., 1558.

RASIS, or rather AR-RA'ZI, is the patronymic of a celebrated Arabian writer, whose entire name was Ahmed Ibn Mohammed Ibn-Mûsa. He was denominated Ar-râzi because his family was from Ray, a province of Persia. He was born at Cordova about the middle of the third century of the Hejira (A.D. 864-870). His father, Mohammed Ibn-Mûsa, who was a native of Persia and a wealthy merchant, was in the habit of travelling yearly to Spain with drugs and other produce of the East. Being a man of some learning and ability, he met with great favour and protection from the sultans of the house of Merwan, who then reigned in Cordova; and in one of his visits was prevailed upon to settle in that capital, where he filled offices of trust, being employed in various embassies. He died in the month of Rabi-ul akhar, A.H. 273 (October, A.D. 886). His son Ahmed when still young wrote some poems, which he dedicated to Abdur-rahman III., sultan of Cordova. He also distinguished himself by his early acquirements in theology and jurisprudence, on which sciences he is said to have left

several excellent treatises: but it is in his capacity of royal historiographer that Ar-râzi gained most renown. Besides many historical works, the titles of which have not reached us, he wrote a very voluminous history of the conquest of Spain by the Arabs, together with a geographical description of that country, and a few interesting details on its natural productions, industry, commerce, &c. He wrote likewise a history of Mohammedan Spain under the dynasty of the Beni-Umeyyah, and a topographical description of Cordova, the seat of their empire. There is also a genealogical history by him of all the Arabian tribes who settled in Spain at the time of the conquest or soon after it. A portion of the first-mentioned historical work was translated into Spanish about the end of the 13th century by a converted Moor named Mohammed, and by Gil Perez, a chaplain to King Dinis of Portugal, by whose orders the version was made. Both Casiri ('Bib. Ar. Hisp. Esc.' vol. ii., p. 329) and Conde ('Hist. de la Dom.', vol. i., p. 9) have asserted, without the least foundation, that the 'Historia del Moro Rasis'—for such is the title of the Spanish version—is apocryphal; but there can be no doubt that the work, though containing numerous interpolations and abounding with blunders, like most translations from eastern languages made during the middle ages, is an authentic one. There is a manuscript of the history of Ar-râzi in the library of the British Museum. The year of Ar-râzi's death is not known; but as his history falls rather short of the reign of Abdur-rahmán, whose historiographer he was, we may safely conclude that he died before A.H. 350 (A.D. 961), the date of that sovereign's death.

RASK, RASMUS CHRISTIAN, one of the most distinguished linguists of modern times, was born on the 2nd of November 1787, at Brendekilde, near Odense, in the island of Fyen, or Funen, in the kingdom of Denmark. His parents were very poor people, but the boy's talents and inclinations procured him friends who afforded him the means of prosecuting his favourite studies in the University of Copenhagen. He afterwards spent some time in Iceland, and also made journeys to Sweden, Finland, and Russia for the purpose of increasing his knowledge of languages, for which he had a very extraordinary talent. In 1808 he obtained a situation connected with the university library at Copenhagen, and he availed himself of the opportunity by making himself acquainted with the most ancient documents of northern history and literature. His knowledge of languages led him to devote himself to comparative philology, to search after the connecting links and trace them to their common origin; and in order to complete this branch of study, he undertook in 1817, with the support of the Danish government, a journey to Russia, whence he proceeded in 1819 to Persia. He made some stay at Teheran, Persepolis, and Shiras, and in 1820 went to India, whence he returned in 1822 to his native country. In this expedition he had purchased for the Copenhagen library 113 ancient and rare oriental manuscripts, among which those in the Pali language were the most valuable. Soon after his return he was invited to a professorship in the University of Edinburgh, but as he declined the offer, he was appointed professor of the history of literature in the University of Copenhagen. The king had promised him his support, if Rask would prosecute his oriental studies, but for some time he neglected them, and devoted his time to an analysis of the Danish language. In 1827, however, he returned to his oriental pursuits, and wrote on Egyptian and Hebrew chronology, and on the age and authenticity of the Zend Vesta. In the meantime he had become president of the Icelandic society of literature, and of the society for the investigation of northern antiquities, and he took an active part in the management and editorship of the journals of these societies. At the same time he was engaged in the preparation of an Armenian Dictionary, an Italian, Low German, and English Grammar. In 1829 he was appointed professor of oriental languages and chief librarian of the university library. Henceforth his attention was engaged almost exclusively by the eastern languages, but his edition of 'Lockman's Fables,' Copenhagen, 1832, shows that his knowledge of Arabic was very deficient; and it may be said in general that, as far as the oriental languages are concerned, he had more skill in general comparisons and investigations of their grammatical structure than an exact knowledge of any particular language. His works show that there was scarcely a language worth studying of which he had not some knowledge: and all the civilised languages of Europe were almost as familiar to him as his own mother-tongue, and his knowledge of the northern languages is unrivalled. He died at Copenhagen on the 14th of November 1832, and his numerous manuscripts relating to philology were given up by his relatives to the king's library at Copenhagen.

The principal works of Rask are—1, 'An Introduction to the Study of the Icelandic and Ancient Northern Languages,' Copenhagen, 1811; 2, an 'Anglo-Saxon Grammar,' Stockholm, 1817, one of his best works, has been translated into German and English; 3, 'Investigations concerning the Origin of the Ancient Northern or Icelandic Language,' Copenhagen, 1814; 4, An edition of Björn Haldorsen's 'Icelandic Dictionary,' Copenhagen, 1814; 5, A 'Spanish Grammar,' Copenhagen, 1824; 6, A 'Frisian Grammar,' Copenhagen, 1825; 7, 'An Attempt to reduce the Orthography of the Danish Language to Principles,' Copenhagen, 1826, is a strange work, in which Rask attempted to introduce a complete reform in Danish orthography. He did not succeed in his attempt, but the work is full of the most extraordinary linguistic learning.

8. 'On the Age and Authenticity of the Zend-avesta,' Copenhagen, 1826, was translated into German by F. H. von der Hagen, Berlin, 1826; 9. A small 'Grammar and Vocabulary of the Acra Language.' In the last year of his life he finished a very complete 'Grammar of the Language of Lapland.' A number of essays on linguistic subjects appeared in various journals, and in Vater's 'Vergleichungstafeln' there is one on 'Die Thrakische Sprachklasse,' which is of great importance and interest. Comparative philology is greatly indebted to Rask; for he was the first who pointed out the connection between the ancient northern and Gothic on the one hand, and of the Lithuanian, Slavonic, Greek, and Latin on the other hand.

\*RASPAIL, FRANÇOIS-VINCENT, is almost equally well known in the departments of science and of French politics. He was born at Carpentras, in the department of Vaucluse, on January 29, 1794. He very early evinced a decided inclination for the study of botany and chemistry, in both of which he made observations that were communicated to and inserted in the scientific journals of France. In 1825 he became editor of the natural history department of the 'Bulletin des Sciences.' In 1829, in conjunction with Saigey, he commenced the 'Annales des Sciences d'Observation,' but which was given up in the following year for want of support. His strong political feelings however had been displayed even earlier, and in 1822 he had published 'Sainte Liberté! ton nom n'est pas blasphème,' and the revolution of July 1830 gave his mind a decided bias. He took an active part against Charles X., he fought at the barricades, inscribed his name as a member of the artillery brigade of the National Guard, and supported republican principles with all his might. The elevation of Louis-Philippe to the throne was consequently disagreeable to Raspail, who opposed the government measures generally, and wrote articles in the 'Tribune,' for which at length he was prosecuted, and sentenced to six months' imprisonment. After his release he was again arrested in 1834 as a member of illegal associations, but as nothing could be proved against him he was quickly set at liberty, and he then became chief editor of the 'Reformateur,' which however had but a short existence. During these eventful periods he by no means neglected his scientific labours. In 1831-32 he published in 5 vols. his 'Cours Élémentaire d'Agriculture et d'Économie Rurale,' an excellent work; in 1833 his 'Système de Chimie Organique,' in which he recommended microscopic as well as chemical investigations into organic objects, and which has been translated into English by Henderson; and in 1837 'Système de Physiologie végétale et de botanique.' Besides some occasional political pamphlets he wrote, in 1839, 'Lettres sur les Prisons de Paris.' In 1843 he published 'Histoire Naturelle de la Santé et de la Maladie chez les Végétaux et chez les Animaux en général et en particulier chez l'Homme; servira de formule pour une nouvelle Méthode de Traitement hygiénique et curatif,' second edition, enlarged, in 3 vols., 1846. In 1846 also he published a 'Manuel Annuaire de la Santé, ou Médecine, et Pharmacie Domestique.' A translation of this was published in English in 1853, under the title of 'Domestic Medicine, or Plain Instructions in the Art of Preserving and Restoring Health by simple and efficient means, edited by G. L. Strauss.' Some of the directions for preserving health are judicious enough, but the great remedy was camphor, exhibited in various forms, and especially as what were termed cigarettes. Raspail sold his medicaments in the form in which our quack medicines are sold, that is, in packets, with the vendor's signature, and an action was brought against him for transgressing the etiquette of the medical profession. It was instituted by Fouquier, physician to the king, and Orfila, dean of the faculty of medicine. Raspail pleaded that he was not a physician, but the inventor of certain medicines, and did not therefore require a diploma to practise. He was however found guilty, and sentenced to a small fine. On the occurrence of the coup-d'état in 1852 he took a decided part against Louis Napoleon, and was consequently imprisoned. While in confinement at Doullens, his wife died on March 8, 1853, and occasion was taken of her funeral to give a manifestation of republican feeling and of admiration for his consistency, by a procession exceeding 20,000 persons, who followed the body to its place of interment in the cemetery of Père la Chaise. M. Raspail has not attracted much notice since. Two biographies of him have been published: 'Biographie de F. V. Raspail,' by C. Marchal, Paris, 1848, and 'Notice Biographique sur le Citoyen F. V. Raspail.'

RASTALL, or RASTELL, JOHN, one of our early printers, is said by Bale to have been a citizen of London, and by Pits a native of that city. Wood says he was educated in grammar and philosophy at Oxford, and returning to London, set up the trade of printing. The first work which bears his name as printer, with a date, was published in 1517, the last in 1533. There are numerous others without dates. His residence was at the sign of the Mermaid, at Paul's Gate next Cheapside. He married Elizabeth, sister to Sir Thomas More, with whom Herbert supposes he became intimate in consequence of being employed to print Sir Thomas's 'Dialogue on the Worship of Images and Reliques,' published in 1529; but, as will hereafter be seen, his eldest son was born in 1528.

Bale and Pits ascribe the authorship of various works to John Rastall; the most remarkable of which is his 'Anglorum Regum Chronicon, or Pastyme of People,' a work of extreme rarity, reprinted in 1811 in the 'Collection of English Chronicles.' He translated from French into English the Abridgment of the Statutes before the reign of

Henry VII., and also abridged those of that reign which were made in English, as likewise those of Henry VIII., including the twenty-third and twenty-fourth of his reign. He also compiled several law-books. Of these, his 'Exposition of Law Terms and the Nature of Writs,' and the book called 'Rastall's Entries,' continued long in use. He became a convert to the Reformed religion by means of a controversy with John Frith. Rastall published 'Three Dialogues,' the last of which treats of purgatory, and was answered by Frith. On this, Rastall wrote his 'Apology against John Frith,' which the latter answered with such strength of argument as to make a convert of his opponent. Rastall also wrote a book called 'The Church of John Rastall,' which was placed in the list of prohibited books published by Bishop Bonner, annexed to his injunctions, in 1542. He died at London in 1536, leaving two sons, William (noticed below), and John, who became afterwards a justice of the peace.

RASTALL, WILLIAM, son of the above, was born in London in 1508, and about 1525 was sent to Oxford, which he left without taking a degree, and entered at Lincoln's Inn for the study of law. In the first of Edward VI. he became autumn or summer reader of Lincoln's Inn; but on the change of religion he retired with his wife to Louvain, whence he returned on the accession of Queen Mary. In 1554 he was made a serjeant-at-law, one of the commissioners for the prosecution of heretics, and in 1588, a little before Mary's death, one of the justices of the Common Pleas. Queen Elizabeth renewed his patent as justice, but he preferred retiring to Louvain, where he died August 27, 1565. From 1530 to 1534 (Dibdin, in his edition of Herbert's 'Amen,' thinks till 1554), William Rastall carried on the business of a printer, in conjunction with his practice as a lawyer. When Justice Rastall he published 'A Collection of the Statutes in Force and Use,' in 1557.

RASTOPCHIN. [ROSTOPCHIN.]

\*RAUCH, CHRISTIAN, an eminent German sculptor, was born at Arolsen in the principality of Waldeck, on the 2nd of January 1777. He early showed an aptness for art, and received instructions in it from the sculptor Professor Ruhl of Cassel. In his twentieth year he went to Berlin, having being presented to an office in the court of the Queen of Prussia; but his spare hours were all devoted to art. He here secured the friendship of Count Sandrecky with whom he set out in 1804 on a tour through a part of France to Genoa, and thence to Rome. There with the advice and aid of William von Humboldt, then Prussian minister in that city, he devoted himself to the study of the antique, while he availed himself of the friendly instruction of the chief living sculptors, Canova and Thorwaldsen. After a due probation he produced several original works, among others, bassi-relievi of 'Hippolitus and Phædra,' a 'Mars and Venus wounded by Diomedes,' a 'Child praying,' &c. But he began still more to distinguish himself in the line to which he has continued to owe his chief celebrity, that of portraiture; besides abundant private patronage, he received from the King of Prussia commissions to execute a colossal bust of the King of Prussia, and a life size bust of the queen; and from the King of Bavaria, a bust of Rafael Mengs. In 1811 he was recalled to Berlin, to execute a monumental statue of the Queen Louise. His design was approved, and his health having failed he was permitted to proceed to Carrara to complete the work, which he did in 1813, in a style that secured his reputation. He then went on to Rome where he remained till 1822, when he returned to Berlin, where he has since resided. During his second residence in Rome Rauch was chiefly engaged on busts and statues; he executed for the King of Prussia, besides a marble statue of the king himself, monumental statues of Generals Bulow and Scharnhorst. By 1824 he had executed with his own hand seventy marble busts, twenty of them being of colossal size. Among the more important of his later works may be mentioned two colossal bronze statues of Field Marshal Blücher; the first, representing the hero in vehement action, was erected with great solemnity at Breslau, July 9, 1827; the second designed after Blücher's death, for the King of Prussia, represents the veteran in repose.

Another of his principal works is a seated bronze statue of Maximilian of Bavaria, erected in 1835 in Munich. The 'Victories' for the Walhalla, near Ratisbon, are also from his chisel. A well-known statue of Göthe, modelled from the life, is the most perfect representation of the great poet of modern Germany. Statues in marble or bronze of Schiller, Schliermacher, and others of his chief contemporaries, and of Luther, Albert Dürer, and other famous Germans of an older time, serve to show the high estimation in which his works are held by his countrymen; while bronze statues of two or three of the old Polish kings, which he executed for Count Raczyński, to be placed in Posen Cathedral, and a bas-relief erected at Dublin in memory of Miss Cooper, show that his ability is appreciated beyond Germany. His chief work however is the grand monument of Frederick the Great of Prussia, erected in the finest part of Berlin. This work, in the design of which Rauch was assisted by Professor Schinkel, the architect, and which called into exercise all the resources of the two artists, was commenced in 1830. The general model was completed in 1839; the colossal model of the king was not however ready till 1842, and the statue was cast in 1846. Four more years were required for the execution of the bas-reliefs, and the statues of military commanders, ministers, judges, literary men, &c., and figures of the Virtues and the like, which were to be placed around the base,

Meanwhile the granite basement was being constructed, and by the beginning of 1851 the whole was finished. It was inaugurated with the greatest pomp in May 1851. Of this—perhaps the most elaborate monumental work of recent years—a small model may be seen in the Crystal Palace, Sydenham, as well as casts of the colossal equestrian statue of the king which crowns the monument, of the bassi-relievi which represent the chief transactions of his life, and of some of the detached statues. The work is a sort of compromise between the severity of classic and the freedom of romantic art, and will not in its details stand the test of rigorous criticism; but, casting aside minute criticism, it must be held to be one of the very finest as well as most imposing of recent commemorative works. And we may add that, even without this his master-work, Rauch would unquestionably stand at the head of living portrait and monumental sculptors, though far from ranking among the first in ideal sculpture.

RAUPACH, ERNST BENJAMIN SALOMON, one of the most prolific of modern German dramatists, was born at the village of Straupitz, near Liegnitz, in Silesia, on May 21, 1784. He received his early education at the gymnasium at Liegnitz, and in 1801 proceeded to Halle to study theology. He afterwards went to Russia, where for ten years he occupied himself diligently as a teacher, and after a residence in that capacity at St. Petersburg for a year and a half, he was appointed professor of philosophy in the University there, to which in 1818 was added the professorship of German literature. In 1822 he quitted Russia, and having received somewhat later the solicited discharge from his professional duties, he travelled for a time about Germany, visited Italy, and at length returned and settled at Berlin. The result of his journey to Italy appeared in 1823 in 'Hirswenzel's Briefe aus Italien.' His dramatic productions had already been numerous, ranging from 1810 downwards, though many did not appear in print till long after they had been written. In 1837-38 he published his series of historical plays in illustration of events connected with the Hohenstaufen dynasty of emperors of Germany, which formed eight volumes. His dramatic works were published in a collected form in two divisions, 'Dramatische Werke komischer Gattung' ('Dramatic Works of the Comic Species'), in 8 vols., 1826-34; and 'Dramatische Werke ernster Gattung' ('Dramatic Works of the Serious Species') in 18 vols., 1830-44. These works display considerable inventive powers, a great command over his materials, a thorough knowledge of stage resources, a sense of fitness, with a happy introduction of interesting situations. In his serious dramas he often reaches to the expression of deep passion, and in his comedies and farces a rich vein of verbal wit. His poetic style is harmonious and natural, and he has consequently been a favourite with the public. His defects are a want of poetic consistency, a weakness of characterisation, and occasionally a lapse from pure morality, as in his 'Robert der Teufel,' and one or two others. His series of historical plays on the Hohenstaufen, by provoking a comparison with those of Shakspeare, appear the most defective in dramatic merit, but they contain some fine passages. He also published two collections of tales, one in 1820, another in 1833; but they possess little merit, and attracted but little attention. In 1842 he was created a privy-councillor, having previously been made a councillor. He died in March, 1852.

RAVENSCROFT, THOMAS, was born in 1592. He received his musical education in St. Paul's choir, and was admitted to the degree of Bachelor in Music, by the University of Cambridge, it is supposed, when only fifteen years of age. In 1611 he printed a collection of twenty-three part-songs, under the title of 'Melismata, Musical Phantasies,' &c., in which is his justly admired four-voiced song, 'Canst thou love and lie alone?' In 1614 appeared his 'Brief Discourses,' &c., another collection of twenty part-songs, to which is prefixed a discourse or essay on the old musical proportions, a vain endeavour to rescue them from the neglect into which they had deservedly fallen. In 1621 he published 'The whole Book of Psalms, &c., composed into four parts by sundry authors, to such several tunes as have been and are usually sung in England, Scotland, Wales, Germany, Italy, France, and the Netherlands.' Among the 'authors' appear the names of Tallis, Morley, John Milton (father of the poet), &c. Many are by Ravenscroft, who, had he only produced St. David's, Canterbury, and Bangor tunes, would have ensured the respect and gratitude of his country. The work, the first of the kind, we believe, that had appeared, contains a melody for each of the hundred and fifty psalms, many newly composed, and all harmonised by the above-mentioned persons. Tradition ascribes to Ravenscroft the merit of having been compiler of two other works, similar in character to the 'Melismata'—namely, 'Pammelia' and 'Deuteromelia,' both well known to musical antiquaries, highly valued by them, and now exceedingly rare; and the tradition receives support from an allusion in the 'Apologie' to his 'Brief Discourse, to 'Harmonies by divers and sundry Authors,' formerly published by him, the errors in which, he says, are "corrected in this (i.e. *The Discourse*) fourth and last work." The 'Pammelia,' comprising one hundred pieces, is dated 1609; the 'Deuteromelia,' containing thirty-two, bears the same date. A selection from the four above-named secular works was privately printed in 1822, for the use of The Roxburghe Club, by the Duke of Marlborough, who unhesitatingly ascribes the whole to Ravenscroft, though it might have been seen at a glance that this composer was author of but a few, while he may have been editor of all.

\*RAWLINSON, SIR HENRY CRESWICKE, was born at Chadlington, in Oxfordshire, in 1810, the son of Abraham Tysack Rawlinson. He was educated at Ealing, and entered the East India Company's military service in 1826. He served in the Bombay presidency till 1832, when he was appointed to the Shah of Persia's army, in which he remained till 1839. On January 1, 1833, he wrote his first letter to the secretary of the Asiatic Society, announcing that he had copied and read the Behistun inscription in Kurdistan, enclosing a specimen of his reading. At this time he knew nothing of what Lassen, Burnouf, and Rask had done in Europe regarding this inscription, which is in the cuneiform character. He continued to make occasional communications on the subject to the Asiatic Society till July 1839, when he sent a précis of the whole inscription, which was read at one of their meetings, and the first portion, containing the fac-similes and translations of the whole of the Behistun inscriptions, was published in September 1846, and the Babylonian version, alphabet, and analysis of part of it was published in December 1851. The Afghan war occasioned his recall, and he was political agent at Candahar throughout that struggle, from 1840 to 1842. He was removed in 1843 to Baghdad as political resident, and here he studied the inscriptions of Nineveh. In 1844 he was appointed British consul there, and consul-general in 1851. He retired from the East India Company in 1856, and was created a K.C.B. He has received Persian and Turkish orders of knighthood, and is a member of many learned foreign societies as well as a Fellow of the Royal Society of London. Since his residence in London he has been zealously deciphering and investigating the character of the languages used in the cuneiform inscriptions, with great success and with important results, assisted by Mr. Edwin Norris [NORRIS]. Besides numerous papers in the journals of the Asiatic and Geographical Societies, he has published 'Outline of the History of Assyria, as collected from the Inscriptions discovered by A. H. Layard in the Ruins of Nineveh. Printed from the Journal of the Asiatic Society,' London, 1852; and 'Memorandum on the Publication of the Cuneiform Inscriptions,' 1855. He is now preparing, at the cost of the government, copies of the most interesting inscriptions found at Nineveh and Babylon, chiefly from the originals in the British Museum.

RAY, JOHN, or WRAY (as he at one time spelt his name), who may be considered as the founder of true principles of classification in the vegetable and animal kingdoms, was the son of a blacksmith, and was born at Black-Notley, near Braintree in Essex, on the 29th of November 1627. He received a good education, being sent first to the grammar-school at Braintree, and afterwards to the University of Cambridge, where he entered at Catherine Hall, but subsequently removed to Trinity College, of which he was elected a fellow in 1649, together with Isaac Barrow. At the age of twenty-three he was appointed Greek lecturer, and two years afterwards mathematical tutor to his college. He was also private tutor to several gentlemen of rank, and among others to one who possessed a kindred spirit to himself, and whose name afterwards became closely associated with his own in the paths of science, Francis Willughby. Ray was always fond of the study of natural history; but his cultivation of the science of botany is said to have been owing to an illness, which compelling him to remit his drier studies, he collected and investigated the different wild plants which he met with in his walks about Cambridge. In 1660 he published a 'Catalogus Plantarum circa Cantabrigiam nascentium,' 1 vol. 8vo, which he says took him ten years to compile.

During his residence at the university he travelled over the greater part of England, Wales, and Scotland, in the pursuit of botanical and zoological information, and was generally accompanied in these excursions by his friend and pupil Mr. Willughby. At the Restoration he took orders, but never held any church preferment, nor performed regular parochial duty; and two years afterwards he was obliged to resign his fellowship in consequence of the passing of the Act of Uniformity, to which he could not conscientiously subscribe. After leaving the university he resided chiefly with Mr. Willughby at Middleton Hall in Warwickshire, and devoted the remainder of his life solely to the pursuit of natural history. In 1663 he embarked for the Continent with Mr. Willughby, where they remained for three years travelling through the Low Countries, Germany, Italy, Switzerland, and France; and collecting information respecting the animals and plants which inhabit these different countries. Willughby attended chiefly to zoology, and Ray to botany. An account of this tour was published by Ray in 1673 in 1 vol. 8vo. In 1667 he was elected a Fellow of the Royal Society, to the 'Transactions' of which learned body he contributed some valuable papers. In 1672 he had the misfortune to lose his friend Mr. Willughby, who died at the age of thirty-seven, leaving him guardian to his two sons (the younger of whom was afterwards created Lord Middleton), and a legacy of 60*l.* per annum. After superintending the education of Mr. Willughby's children for some time at Middleton Hall, he removed to Sutton Coldfield in Warwickshire, and then to Falkbourn Hall, Essex; and lastly he settled in 1679 at Black-Notley, his native place, where he remained till his death, which took place on January 17, 1704-5, at the age of seventy-seven.

Ray left many works, among which the botanical and zoological hold such a conspicuous place in the history and literature of those

sciences, that they demand a brief notice. His first publication was the 'Catalogue of the Plants growing in the Neighbourhood of Cambridge,' which we have already mentioned. This work contains a description of 626 species arranged alphabetically, and accompanied with the synonyms of the principal botanical authors who had preceded him: it is curious from its being the first production of a man who afterwards attained to such great celebrity, and it exhibits traces of those singular powers of observation which he afterwards so eminently displayed. A Supplement to this Catalogue appeared in 1668, and a second in 1685.

In 1682 appeared his 'Methodus Plantarum Nova,' 1 vol. 8vo, in which he proposed a new method of classifying plants, which when altered and amended, as it subsequently was by himself at a later period, unquestionably formed the basis of that method which, under the name of the system of Jussieu, is generally received at the present day. In the formation of the principal groups into which he divided the vegetable kingdom, Ray derived his characters sometimes from the fruit, sometimes from the flower, and sometimes from other parts of the plant, as each in its turn seemed to offer the most strongly marked points of distinction. He first proposed the division of plants into dicotyledons and monocotyledons. ('Methodus Plantarum,' edit. 2, p. 2.) He extended these divisions both to trees and herbs, stating that palms differ as much in this respect from other trees as grasses and lilies do from other herbs. Though he made these great discoveries and improvements, Ray obstinately continued in the old error of separating woody from herbaceous plants, or trees from herbs, and he held a long controversy with Rivinus on this point; he even went so far as to state that one of these divisions might be distinguished from the other by the presence of buds, which he says are only developed in woody plants. To him is due however the honour of the discovery of the true nature of buds, for he says that they are points at which new annual plants spring up from the old stock; but he stopped short in his discovery in not extending them to herbaceous plants. In the first edition of the 'Methodus' he formed twenty-five classes, taking the woody plants first, which he divided into trees and shrubs. In this system he fell into many errors, one of the most glaring of which, as he himself afterwards observed, was the separation of the different species of corn from the other grasses. He subsequently altered this, and revised the whole arrangement, making thirty-four groups instead of twenty-five; many of which are almost exactly the same as are adopted by botanists of the present day under the name of Natural Orders.

His arrangement was too far in advance of the knowledge of the day, and the consequence was that it was little appreciated or adopted by his contemporaries and immediate successors, who, instead of improving the arrangement so ably sketched out, set about establishing others on artificial principles, all of which are rapidly sinking into oblivion, while the principles of Ray are tacitly admitted, and many of his fundamental divisions adopted in that beautiful but still imperfect Natural System which has been formed by the labours of Jussieu, Brown, De Candolle, Lindley, and others.

While he made these important improvements in classification, this great botanist did not neglect the study of species; his 'Catalogus Plantarum Angliæ' first appeared in 1670, arranged alphabetically, and has been the basis of all subsequent Floras of this country. A second edition appeared in 1677, and in 1690 he published a third, entitled 'Synopsis Methodica Stirpium Britannicarum,' which is arranged according to his natural system. Another edition of the 'Synopsis' came out in 1696, and it was again republished by Dillenius in 1724. This work, of which the edition of 1696 is the best, is very accurate. Ray examined every plant described in the work himself, and investigated their synonyms with great care.

In 1694 he published 'Stirpium Europæarum extra Britannias crescentium Sylloge.' This work contains a description of all those plants which he had himself collected on the Continent, as well as many which had been described by others. The synonyms are here very exact.

His largest botanical work was a general 'Historia Plantarum,' the first volume of which came out in 1686, fol.; a second appeared in 1688, and a third, which was supplementary, in 1704. In this vast work he collected and arranged all the species of plants which had then been described by botanists; he enumerated 18,625 species. Haller, Sprengel, Adanson, and others speak of this work as being the produce of immense labour, and as containing much learning and acute criticism; but from its nature it was of course principally a compilation.

Ray made many researches in vegetable physiology. He published a very interesting paper in the 'Philosophical Transactions' (No. 68), on the mode of ascent of the sap, and we find many observations on the structure and functions of plants scattered through his various works. In the first volume of the 'Historia Plantarum' he collected together, under the title of 'De Plantis in Genere,' all the principal discoveries which had been made on the structure and properties of plants by Cæsalpin, Grew, Malpighi, and others, as well as by himself; so that he thus published by far the most complete introduction to botany that had then appeared.

In zoology Ray ranks almost as high as in botany; and his works on this subject are even more important, as they still in a great measure preserve their utility. Cuvier says, that "they may be con-

sidered as the foundation of modern zoology, for naturalists are obliged to consult them every instant, for the purpose of clearing up the difficulties which they meet with in the works of Linnaeus and his copyists." Mr. Willughby, at the time of his death, left to his friend Ray the task of arranging and publishing the various materials which he had collected for an extensive work on the animal kingdom. Ray exhibited as much zeal as fidelity in the execution of this trust, for he might have called the works partly his own without much injustice, as he had assisted in the first collection of the materials, and had the entire task of arranging and classifying them; besides which, it is easy to observe, as Cuvier had remarked, that the histories of plants and animals are both written by the same hand. The 'Ornithologia' of Willughby, which was the first part of the work that appeared, was published in 1676, one vol. fol., with seventy-seven plates. An English translation of it, by Ray, appeared the following year. The remaining part, which is the most complete, was the 'Historia Piscium,' and did not come out till 1686, 2 vols. fol. These works contain a great number of new species of birds and fishes, which had been discovered by Willughby and Ray in Germany and Italy, as well as those which had been previously described. Cuvier says, "The fishes of the Mediterranean are described with rare precision, and it is frequently easier to find species in Willughby than in Linnaeus." Many of the figures in these works are original, and very good.

Ray published several works of his own on zoology. He undertook to form a classical arrangement of the whole animal kingdom, as he had of the vegetable; and, in 1693, he published his 'Synopsis Methodica Animalium, Quadrupedum, et Serpentinæ Generis,' in 1 vol. 8vo. Similar volumes on birds and fishes were also prepared by him, but were not published till after his death, by Dr. Derham, in 1713. The two last are principally abridgments of the great works published under the name of Willughby. He also left an admirable history of insects, which was likewise published by Dr. Derham, at the expense of the Royal Society; and contains an appendix on beetles, by Dr. Lister. The most important character of the zoological works of Ray is the precise and clear method of classification which he adopted. The primary divisions of his system were founded on the structure of the heart and organs of respiration. His arrangement of the classes of quadrupeds and birds has been followed by many naturalists. Both Linnaeus and Buffon borrowed largely from the works of Ray. Buffon extracted from Willughby's 'Ornithology,' almost all the anatomical part of his history of birds; and Cuvier says that the 'Dictionnaire d'Ichthyologie,' by Daubenton and Hatry, in the 'Encyclopédie Méthodique,' consists in great part of translations from Ray's works on fishes.

In addition to his numerous scientific writings, Ray composed several works on divinity and other subjects: the best known of these are, 'A Collection of Proverbs,' which came out in 1672, and went through several editions; 'The Wisdom of God in the Creation,' 1690, which also had an extensive sale; 'A Persuasion to a Holy Life,' 1700; and three 'Physico-Theological Discourses concerning Chaos, the Deluge, and the Dissolution of the World,' 1692.

RAYMUND LULLY. [LULLY.]

RAYNAL, GUILLAUME THOMAS FRANÇOIS, was born in 1711, at St. Geniez, in the province of Rouergue, now the département de l'Aveyron. He studied in the Jesuits' College at Pézénas, and took orders as a priest, but afterwards left the Jesuits, and came to Paris, where he was made assistant-curate of the parish of St. Sulpice, in 1747. It is stated, in the 'Biographie Universelle,' that he was dismissed from the service of that parish in consequence of simoniacal practices; among others for exacting illegal fees for performing the office of the dead. He next turned to literary pursuits, and having made himself acquainted with several influential men, he became editor of the 'Mercure de France.' He also wrote 'Histoire du Stathouderat,' 12mo, 1748, which has been reprinted several times. It is a superficial work, and written in a declamatory style. His 'Histoire du Parlement d'Angleterre' is equally superficial and inaccurate. From these and his 'Anecdotes Littéraires,' 'Anecdotes historiques, militaires, et politiques,' and other similar light works, he derived a considerable profit. At the same time Raynal speculated in mercantile affairs, and it is said by Désessart, in his 'Siècles Littéraires de la France,' that he employed capital in the slave-trade. At Paris he frequented the society of Helvetius, Holbach, and Madame Geoffrin.

In 1770 he published his great work, by which he is chiefly known, 'Histoire Philosophique des Établissements des Européens dans les deux Indes,' 4 vols. 8vo, La Haye, without the author's name. The work was reprinted several times, both in France and out of France, with additions by the author; and although many passages were written in a very violent tone against monarchy, and especially the French monarchy, and against Christianity, the French government allowed the book to circulate undisturbed. In the mean time Raynal travelled in Holland and England, and collected fresh materials for his work, of which he published a new and enlarged edition at Geneva, 10 vols. 8vo, 1780, with his name and his portrait.

The French authorities now took notice of the book. In May 1781, the parliament of Paris condemned it to be burned by the hand of the

executioner, and ordered the author to be arrested and his property sequestered, but his friends in office gave him timely notice to quit France and to place his property in safety. Raynal repaired to Spa, where a young Belgian addressed to him a laudatory epistle, 'La Nymphé de Spa à l'Abbé Raynal,' which drew upon the author the censure of the prince bishop of Liège, the sovereign of the county. Raynal replied by another letter, in which he abused the clergy, and bishops in particular, in the most virulent manner. He had long since openly renounced his priestly character, and spoke of himself as "having been once a priest." From Spa he repaired to Saxe-Gotha, and from thence to Berlin, where he with some difficulty obtained an audience of Frederick the Great, who was displeased at some passages of his work which reflected upon himself. Frederick afterwards wrote to D'Alembert concerning his interview with Raynal, who, he said, spoke much about the wealth, the resources, and the power of nations, and in so positive a manner, "that, in listening to him, I almost fancied that I was listening to the voice of Providence." In 1757, Raynal was allowed to return to France, but not to Paris. His friend Malouet, who was intendant-general of the navy at Toulon, received him hospitably in his house. Raynal marked his residence in the south of France by several acts of beneficence and philanthropy, as he had done previously during a journey in Switzerland.

When the first symptoms of the French revolution showed themselves, Raynal was elected by the city of Marseille as their representative in the states-general. He declined the honour on the plea of old age; but the fact was that his opinions had undergone a great change. In December 1790, a letter appeared in the papers, purporting to be addressed by Raynal to the National Assembly, expressive of his altered sentiments on political subjects. This however was disavowed by Raynal's friends; but on the 31st of May, 1791, Raynal did address an eloquent letter to Bureau de Puzy, president of the National Assembly, in which, after drawing a gloomy sketch of the state of France, of the persecutions of the clergy, of the inquisitorial power exercised against opinions, of the disorders and violence of every sort which were daily perpetrated by mobs with impunity, and all in the name of liberty, he stated his regret that "he was one of those who, by expressing in his works a generous indignation against arbitrary power, had perhaps been the means of putting weapons into the hands of licentiousness and anarchy." This letter, being read publicly by the president, occasioned a violent storm in the Assembly. Roederer called the president to order for reading the letter. ('Moniteur,' 31st of May, 1791.) Journals and pamphlets vied with each other in abusing Raynal as a renegade and a dotard. Raynal however remained quiet in the neighbourhood of Paris; he passed unmolested through the period of terror; and he died in March, 1796, at the house of a friend at Chaillot. Just before his death the Directory had named him member of the National Institute, and his 'éloge' was read by Lebreton at one of the first sittings of that body.

A new edition of Raynal's 'History' was published at Paris in 11 vols. 8vo, 1820-21, with a biographical notice and reflections on the works of Raynal, by M. A. Jay. The following works have been erroneously attributed to Raynal: 1, 'Inconvénients du Célibat des Prêtres' (by the Abbé Gaudin); 2, 'Des Assassinats et des Vols Politiques sous le Nom de Proscription et de Confiscations' (by Servan).

RAZZI, CAVALIERE GIOVANNI ANTONIO, called IL SODOMA, an eminent painter, was born about the year 1479, according to some at Vercelli in Piedmont, and as stated by others at Vergelli, a village near Siena, of which place he had certainly received the right of citizenship. He was instructed, according to Vasari, by Giacomo dalle Fronte, but he chiefly formed his principles by an attentive study of the works of Leonardo da Vinci. Among his earliest performances were the pictures he painted in 1502, at Monte Oliveto, representing the history of S. Benedetto. He was employed at Rome, in the pontificate of Julius II., to decorate part of the Vatican; but his works, with those of some other artists, were removed to make way for the frescoes of Raffaello. Some grotesques however from his hands were preserved. In the Chigi Palace, now called the Farnesina, are some of his pictures, representing the history of Alexander the Great, the most noted of which is the 'Marriage of Roxana,' which were executed by order of Agostino Chigi, and which Fuseli considered to possess much of the chiaroscuro, though not the dignity and grace, of Leonardo da Vinci, and to be remarkable for beauties of perspective and playful imagery. At Siena he painted many works. The 'Adoration of the Magi,' which is in the church of S. Agostino, resembles the style of Leonardo da Vinci; but his *chef-d'œuvre* is the 'Scourging of Christ,' which is in the convent of S. Francisco; the 'Swoon of St. Catharine of Siena,' painted in fresco, in one of the chapels of S. Domenico, is another fine work. The 'St. Sebastian,' in the gallery at Florence, is supposed to be painted from an antique torso. The 'Sacrifice of Abraham,' painted for the cathedral of Pisa, was in the Louvre in 1815, where it excited much admiration: it was returned to Tuscany in 1815.

He is said by Lanzi to have frequently painted in a hurried manner, without any preparatory study, especially in his old age, when, reduced to poverty at Siena, he sought employment at Pisa, Volterra, and Lucca; but still, though careless of excellence, Razzi never painted badly. Vasari seems to have been a systematic opponent of

Razzi, and generally styles him a buffoon, "but," says Lanzi, "Giovio has written of Razzi in a different manner; when speaking of the death of Raffaello, he subjoins, 'plures pari pene gloria certantes artem exceperunt, et in his Sodomas Vercellensis.' He who objects to the testimony of this eminent scholar, will receive that of a celebrated painter: Annibale Caracci, passing through Siena said, 'Razzi appears a master of the very highest eminence and of the greatest taste, and (speaking of his best works at Siena) few such pictures are to be seen.'" Razzi died in 1554. He seems to have had many pupils; the principal one was Bartolommeo Neroni, generally called Maestro Riccio.

RÉAUMUR, RENÉ-ANTOINE FERCHAULT DE, was born at Rochelle in 1683. He was brought up to the law; but being much attached to scientific pursuits, and possessing an independent fortune, he gave up his profession and went to Paris in 1703, where he determined to devote his life to his favourite studies. In 1708 he read some geometrical observations before the Academy of Sciences, which were so well received that he was admitted a member at the age of twenty-four. He belonged to that learned body for fifty years, and contributed a vast number of interesting papers to their 'Mémoires.'

The chief objects of his attention were the improvement of the arts and manufactures of his country, and natural history. In 1711 he made some experiments relative to the manufacture of cordage, and he proved that the strength of a cord is less than the sum of the strengths of the threads of which it consists; whence it follows that the less a rope is twisted the stronger it is. In 1715, while examining the process of colouring artificial pearls, he discovered the nature of the singular substance which gives the brilliancy to the scales of fishes, and he investigated the mode of formation and growth of these scales. He also made some researches of a similar kind on the development of the shells of testaceous animals. When describing in 1715 the mines of (occidental) turquoise, which he discovered in Languedoc, and the means which are employed to colour these stones, he found that the substances of which these gems consist are portions of the fossil teeth of an extinct animal. The most important of Réaumur's labours in the department of the arts were the experiments which he made on the manufacture of iron and steel. He published his researches on this subject in a separate work (those which we have before mentioned appeared in the 'Mémoires' of the Academy), entitled 'Traité sur l'Art de convertir le Fer en Acier, et d'adoucir le Fer Fondu.' He here described the process of making steel, which was then unknown in France (that metal being solely obtained from abroad), and he made his discovery public, for which national benefit the Regent Duke of Orleans settled on him a pension of 12,000 livres. He also discovered the art of tinning iron, which was likewise unknown in France. During his experiments on metals Réaumur first observed that these substances in passing from a fluid into a solid state have a tendency to assume certain definite crystalline forms. Among his other useful labours he greatly improved the manufacture of porcelain in France. He also made a number of experiments on artificial incubation, which has been practised from time immemorial in Egypt. He endeavoured to introduce the art into common use in France, but was not successful, owing principally to the greater coldness of the climate than in Egypt. In 1711 he discovered a species of mollusk from which a purple dye might be prepared, analogous to the purple of the ancients.

In general physics the name of Réaumur is celebrated from the thermometer which he invented in 1731. He took the freezing and boiling points of water as two fixed points, and then divided the interval into 80 degrees, the freezing point being zero. The centigrade thermometer now in more general use in France was only an improvement on Réaumur's, the interval between the freezing and boiling points being divided into 100 instead of 80 degrees.

Though many of the researches which we have mentioned (most of which will be found in the 'Mémoires' of the Academy, together with many papers on other subjects by the same author) were very useful and important, yet his labours in the field of natural history were much more novel and interesting. In 1710 he described the means by which many shell-fish, echinodermata (sea-stars), and other mollusks and zoophytes, execute their progressive movements; and in 1712 he observed the curious phenomena of the reproduction of the claws of lobsters and crabs.

Of all the works of Réaumur, "the most remarkable," as Cuvier says, "and those which cannot fail to be studied with the most vivid interest by those who wish to have just ideas of nature, and of the marvellous variety of means which she employs to preserve the most fragile of her productions, and those which are in appearance the least capable of resistance," are his 'Mémoires pour servir à l'Histoire des Insectes,' of which 6 vols. 4to appeared between 1734 and 1742. Cuvier adds—"The author here carries to the highest point his acuteness of observation in the discovery of those instincts, so complicated and so constant in each species, which maintain these feeble creatures. He unceasingly excites our curiosity by new and singular details. His style is a little diffuse, but clear, and the facts which he relates may always be depended on." While collecting materials for this work we find it recorded that he kept numerous insects of all kinds in his garden, for the purpose of observing their habits and instincts. Unfortunately this work is not finished; and the seventh volume, which came into the hands of the Academy of Sciences after the death

of the author, was left in such an imperfect state that it was not capable of publication. The six volumes which were completed include all the winged insects, except the crickets (*gryllus*), grasshoppers, and beetles. The first two volumes comprise the various kinds of caterpillars, with a description of their forms, mode of life, metamorphoses, &c., as well as the different insects which attack them or live parasitically within them. The third volume includes the cloth-moths, aphides, &c. The fourth embraces the gall-insects and the various two-winged flies. The fifth contains the history of bees, and Réaumur made many interesting discoveries concerning the habits of these curious insects, which however have been greatly added to since by the labours of Huber and others. The smaller communities of wasps, hornets, &c., together with an account of the different kinds of solitary bees, occupy the sixth and last volume, which is one of the most curious of the whole.

Réaumur formed a large collection of objects of natural history, of which Brisson was the conservator, and the principal materials for that naturalist's work on quadrupeds and birds were collected from it. Many of Buffon's plates were also taken from objects in his museum, which, after his death, went to the Cabinet du Roi. Réaumur passed a quiet retired life, and his private history is unmarked by any important incident. He is said to have died from the effects of a fall which he received while riding in the country. His death took place in October 1757, in his seventy-fifth year.

(*Life*, by Cuvier, in *Biog. Univ.*)

REBOLLEDO, BERNARDINO, COUNT OF, a distinguished Spanish officer and writer, was born of illustrious parents at Leon, the capital of the province of that name, in 1597. In early youth he embraced the profession of arms, and joined the Spanish army of Italy, where he so much distinguished himself as to obtain, in 1622, the command of a galley, with which he assisted in the taking of Port Maurice and the castle of Ventimille from the Genoese. After this he served in the army, and was present at the taking of Nice (1626), and the storming of the fortress of Casal, where he was severely wounded. In 1632 he commanded a considerable body of Spanish infantry in the Low Countries. Having, in 1636, received orders from his government to march to the assistance of the Emperor Ferdinand II., who was closely pursued by the Swedes, he succeeded in extricating that monarch from his perilous situation, and was by him rewarded with the title of Count of the Germanic Empire and the government of the Low Palatinate. At the conclusion of the war, Philip IV. appointed him ambassador to the court of Denmark; and he rendered signal service to the king of Denmark when Charles Gustavus marched his army across the frozen sea and bombarded Copenhagen. Though a zealous Roman Catholic, Rebolloredo felt for the royal house of Denmark a kind of personal devotion, which he seized every opportunity of manifesting in his writings. He had early evinced some talent for poetry, and he had whilst in Germany composed a sort of didactic poem on the art of war and state policy, entitled '*Selvas Militares y Politicas*,' which he afterwards published at Copenhagen in 1652, 16mo. But it was not until his mission to that capital, that Rebolloredo found leisure to prosecute with assiduity his poetic studies. He seems to have taken particular interest in the history and geography of Denmark, a compendium of which he put into verse, which was printed at Copenhagen, under the title of '*Selvas Danicas*,' 1665, 4to. After a residence of several years at the court of Denmark, Rebolloredo was recalled to Madrid, where he was soon after appointed president of the Board of War in the council of Castile. He died in 1676, in the eightieth year of his age. Besides the two above-mentioned works, Rebolloredo wrote—1, '*La Constancia victoriosa y Trinos de Jeremias*,' Colonia (Copenhagen), 1665, 4to, being a paraphrase of the Book of Job and the Lamentations of Jeremiah; 2, '*Selvas Sagradas*,' Ib., 1657, and Antwerp, 1661, 4to; 3, a play entitled '*Amor despreciando Riesgos*' ('Love dreads no Danger'), possesses considerable interest. Rebolloredo was particularly successful as a writer of madrigals, some of which are so good as to remind the reader of the best times of Spanish poetry, which in Rebolloredo's time was fast on its decline. His lighter poems appeared at Antwerp, 1660, 16mo, under the title of '*Ocios*,' (Leisure Hours). An edition of Rebolloredo's works was collected in his lifetime, and appeared at Antwerp, 1660, in 3 vols. 4to. But the best and most complete is that of Madrid, 1778, 4 vols. 4to.

RECORDE, ROBERT, an eminent mathematician of the 16th century, was the first native of Great Britain who introduced the study of analytical science into this country. There is no memorial of the exact time of his birth, though it must have been somewhere about the year 1500. We know that he was a native of Tenby in Pembrokeshire, that he entered himself a student at Oxford about the year 1525, where he publicly taught rhetoric, mathematics, music, and anatomy, and that he was elected a fellow of All-Souls' College in 1531. Making physic his profession, he repaired to Cambridge, and in 1545 he received the degree of M.D. from that university, and, says Wood, was highly esteemed by all who knew him for his great knowledge in several arts and sciences. He afterwards returned to Oxford, where, as he had done previously to his visit to Cambridge, he publicly taught arithmetic and other branches of the mathematics with great applause. According to Fuller, he was of the Protestant religion. He afterwards repaired to London, at which place he resided in 1547, and in that year published a medical work entitled '*The Urinal of Physic*,' which

passed through several editions. He was also chosen physician to Edward VI. and Queen Mary, to both of whom he dedicates some of his works. With the knowledge of this latter fact, it is scarcely possible to account for the circumstances in which he was at the time of his decease, a prisoner in the King's Bench. He died in 1553, probably soon after the date of his will (June 23), in which he styled himself 'Robert Recorde, doctor of physicke, though sicke in body yet whole of mynde.' This document is preserved in the Prerogative Office, and furnishes some facts: to Arthur Hilton, under-marshal of the King's Bench, his wife, and the other officers and prisoners, he gave small sums amounting to 6*l.* 16*s.* 8*d.*; to his servant John, 6*l.*; to his mother, and his father-in-law, her husband, 20*l.*; to Richard Recorde, his brother, and Robert Recorde, his nephew, his goods and chattels, out of which his debts and the expenses of his funeral were to be discharged. This last item leads us to think that debt was not, as commonly stated, the real reason for his imprisonment; although, indeed, the amount of property enumerated does not constitute a large sum even for those days. In a codicil to his will, made on the 29th of June, 1553, he gives directions that his law books should be sold to Nicholas Adams, a fellow-prisoner, for 4*l.*

The works of Recorde are all written in dialogue between master and scholar, in the rude English of the time. They are enumerated by the author himself at the end of his work called '*The Castle of Knowledge*,' and there is reason to think that two of his works mentioned in that place are irrecoverably lost, at least no trace of either of them has yet been discovered in print or manuscript. One of them appears to have been entitled '*The Gate of Knowledge*,' and the other '*The Treasure of Knowledge*.'—Recorde's most popular work appeared as early as 1540, under the title of '*The Grounde of Artes*, teaching the worke and practise of Arithmetike, both in whole numbers and fractions, after a more easier and exacter sort than any lyke hath hitherto been set forth.' We have taken this title from the edition of 1573. '*The Grounde of Artes*' was dedicated to Edward VI., and continued to be repeatedly reprinted until the end of the 17th century, the latest edition we have seen being that edited by Edward Hatton in the year 1699. This work contains numeration, addition, subtraction, multiplication, division, reduction, progression, the golden rule, a treatise on reckoning by counters on a principle much resembling that of the Chinese abacus, a system of representing numbers by the hand like the alphabet of the deaf and dumb, a repetition of all the rules for fractions, with the rules of alligation, fellowship, and false position. On the last rule he remarks that he was in the habit of astonishing his friends by proposing difficult questions, and working the true result by taking the chance answers of 'suche children or ydeotes as happened to be in the place.' '*The Pathway to Knowledge*,' a brief compendium of geometry, translated and abridged from the *Elements* of Euclid, was published at London in 1551.

'*The Castle of Knowledge*' was published in 1556, dedicated in English to Queen Mary, and in Latin to Cardinal Pole. This work is written in the form of a dialogue between master and scholar on astronomy, and from the preface we gather that Recorde had not altogether abandoned astrology. It begins with an account of the Ptolemaic system, and afterwards proceeds in an apparently concealed passage to unfold the elements of the Copernican system of the universe. Recorde appears to have been one of the earliest persons in this country who adopted the Copernican system, if not the earliest person who introduced it among us. All that is cited from Euclid and Proclus is in Greek and Latin, usually both.

In the '*Whetstone of Witte*,' which was published in 1557, Recorde has amassed together the researches of foreign writers on the subject of algebra, then in its infancy, and has also incorporated several improvements of his own. In algebra we recognise Recorde as the inventor of the sign of equality, and of the method of extracting the square root of multinomial algebraic quantities. In perception of general results connected with the fundamental notation of algebra, he shows himself superior to others, and even, we may say, to Vieta, although of course immeasurably below the latter in the invention of means of expression. All his writings considered together, Recorde was an extraordinary genius; and it must be remembered he was a lawyer, a physician, and a Saxonist, as well as the first mathematician of his day.

(Halliwell, *The Connexion of Wales with the early Science of England*, 8vo, 1840; and an article in the *Companion to the British Almanac* for 1837, by Prof. De Morgan.)

\* REDGRAVE, RICHARD, R.A., was born in London in 1804. The son of a manufacturer, his youth was spent in the counting-house of his father, his chief employment, he says (Letter in '*Art-Journal*' for February 1850) consisting "in making the designs and working drawings for the men, and journeying into the country to measure and direct the works in progress." The business became an unprosperous one, and he was permitted by his father to follow his own preference for art. He drew in the Elgin and Townley galleries at the British Museum, and about 1826 entered as a student in the Royal Academy; at the same time maintaining himself by teaching drawing. He had exhibited many pictures—the '*Pilgrim's Progress*' appearing, from the catalogues, to be a favourite text-book—before he met with what he terms his "first success." This was the sale of a picture exhibited

in 1837 at the British Institution, 'Gulliver on the Farmer's Table,' which was purchased for engraving, and afterwards passed into the gallery of Mr. Sheepshanks, recently presented by that gentleman to the nation. From this time his course, if not brilliant, was one of steady progress. In 1838 he exhibited at the Royal Academy 'Ellen Orford,' the deserted one of Crabbe's tale, in which he struck into the vein of domestic sentiment which for some years he continued to pursue, and with which his name was long associated. Of these pictures he observes, in the letter above referred to, "It is one of my most gratifying feelings that many of my best efforts in art have aimed at calling attention to the trials and struggles of the poor and the oppressed. In the 'Reduced Gentleman's Daughter' (1840), 'The Poor Teacher' (1843), 'The Semstress' (an illustration of Hood's 'Song of the Shirt,' 1844), 'Fashion's Slaves' (1847), and other works, I have had in view the 'helping them to right that suffer wrong' at the hands of their fellow-men." But this iteration of idea at length seemed to be growing morbid, and every frequenter of the exhibitions felt it to be a relief when Mr. Redgrave turned from righting wrong and suffering to seek new inspiration in the woods and the streams. For some years, from about 1848, landscapes with such titles as 'Spring,' 'Autumn,' 'Skirts of a Wood,' 'Sun and Shadow,' 'Stream at Rest,' 'A Solitary Pool,' 'A Poet's Study,' 'Love and Labour,' 'Woodland Mirror,' 'The Forest Portal,' 'The Lost Path,' 'The Old English Homestead,' 'The Mid-wood Shade,' 'The Sylvan Spring,' 'Source of the Stream,' and the like, formed the staple of his contributions to the Academy exhibitions, though with occasional examples of his earlier, as well as of that more sentimental style spoken of above, and one or two pieces of a still more ambitious character, as 'The Awakened Conscience,' 1849, and the 'Flight into Egypt,' 1851. The landscapes of Mr. Redgrave, though somewhat too minute in detail and lacking ease and freedom, show close observation of nature, and are very pleasing examples of their particular class. His latest works, 1856, were 'Little Red Riding-Hood,' and 'Handy Janie.' The Vernon Gallery contains one of his most satisfactory works, 'Country Cousins,' painted for Mr. Vernon in 1848; and the Sheepshanks' collection contains six pictures by him, which will very sufficiently illustrate his different styles:—'Gulliver on the Farmer's Table,' 'Cinderella,' 'The Governess,' 'Preparing to throw off her Weeds,' 'Ophelia,' and 'Bolton Abbey.'

Mr. Redgrave was elected an associate of the Royal Academy in November 1840, and academician in 1851. For some years he held the appointment of head master in the Government School of Design; and when that institution merged in the Department of Science and Art, he was made art-superintendent, an office he still holds. For the use of the students of the schools connected with the Department of Art he has published 'An Elementary Manual of Colour,' 1853; and two or three of his official addresses and letters have been printed.

REDI, FRANCISCO, was born at Arezzo in 1626. He studied at Florence and Pisa, and took his degree of M.D. in the last-named university. He afterwards proceeded to Rome and Naples, where he applied himself to the study of natural history, and made several curious physiological experiments. On his return to Tuscany he practised medicine with great reputation, and wrote several works concerning that science. Redit was also a poet, and wrote a dithyramb, 'Bacco in Toscana,' in which he extols the various produce of the Tuscan vineyards: it is a splendid specimen of that species of composition. His other works are—1, 'Esperienze intorno alla Generazione degli Insetti,' Florence, 1668; 2, 'Osservazioni intorno alle Vipere,' 1664; 3, 'Esperienze intorno a diverse Cose Naturali, particolarmente a quelle che si sono portate dall'Indie,' 4to, 1671; 4, 'Osservazioni intorno agli Animali viventi che si trovano negli Animali viventi,' 1684; 5, 'Lettera intorno all'Invenzione degli Occhiali,' 1678; 6, 'Consulti Medici,' 1726-29; 7, 'Lettere Familiari,' 1724-27; 8, 'Sonnetti' and other poetry. There are some other of his minor works inserted in the general collection, 'Opere di Francesco Redit,' 3 vols. 4to, Venice, 1712. Redit was a correct and elegant Italian writer, and also one of the most learned men of his age and country. He was a great favourite with the court of Tuscany, and was physician to the grand-duke Ferdinand II. Redit died at Pisa in 1698.

\* REDSCHID PASHA, or MUSTAPHA RESCHID PASHA, was the son of parents in rather affluent circumstances, and was born at Constantinople in 1802. When only fourteen years of age his brother-in-law, Ali Pasha, attached him to his person, and employed him in the Morea and Broussa during his government of those two provinces. In 1826, when the insurrection broke out in the Morea, Redeschid served in the campaign under his patron. After the death of Ali Pasha he transferred his services to Selim Pasha, who made him his private secretary in 1829. He now began his preparation for the higher offices of state by a series of foreign missions. In 1831 he was sent as envoy to Mehemet Ali, viceroy of Egypt; and having taken an active part in negotiating the treaty of Kutahia in 1833, he was in the following year raised to the dignity of Pasha. In the course of 1834 he was sent on a mission to the courts of London and Paris. Nearly two years were thus occupied, and the relations he formed with the leading statesmen, diplomatists, and party leaders in England and France, became the basis of the credit and influence he obtained on his return to his native country. The great measure of Parliamentary Reform had recently been carried in England, and the subject was

still fresh in men's minds. Redeschid Pasha was particularly impressed with this great change, effected as it had been without recourse to violence. When he was recalled to his own court, the following year, to fill an important office in the administration of Pestier Pasha, his mind was occupied with the subject. Almost immediately after his arrival he found himself exposed to imminent danger by the death of the prime minister, who had been overthrown by an intrigue within the palace, and afterwards put to death by the Sultan's orders. But the behaviour of Redeschid Pasha was so circumspect as to baffle the designs of his enemies; whilst the credit he had obtained from his diplomatic missions was so high that he was created Grand Vizir in 1837. He did not however hold this position long, being sent into a sort of honourable exile to Paris.

When the report of the death of Mahmud II. reached Paris, he hastened to return to Constantinople, but not before he had raised up a bulwark to defend the throne of the new sultan against the ambition of Mehemet Ali, by concluding the Quadruple Alliance. By Abdul-Medjid he was made Foreign Minister, and to the practical knowledge and statesmanship which he had acquired in his European missions, are attributed the systematic reforms which, under the name of the 'tanzimat' [ABDU-L-MEDJID], have distinguished the reign of the present sultan. Indeed, it is generally believed that from the accession of the young monarch in 1839 until the present time, being a period of eighteen years, Redeschid Pasha has steadily pursued his object of introducing political reforms into Turkey, and that to him is mainly due the many great—however imperfect—social and religious as well as political improvements which have been effected in that country, and which are more particularly noticed under ABDO-L-MEDJID. But it has been amidst much hostility and discontent that Redeschid Pasha has prosecuted his system of reform. During the late war he was called to direct the government, which through that difficult period he accomplished with signal ability. Though afterwards for a time displaced, he has again become the actual head of the Turkish government, and the high respect in which he is held by European statesmen gives him a strong hold on power. In private life he has likewise by example as well as otherwise sought to modify the objectionable habits of his countrymen: he has but one wife; and he is said to be free from the corrupt practices commonly attributed to the higher officials of Turkey.

REGIOMONTANUS, or, as he styled himself in some of his works, JOANNES GERMANUS DE REGIOMONTE, is the adopted name of a celebrated German astronomer whose real name was JOHANN MÜLLER. He was born June 6, 1436, but his biographers are not agreed as to the place of his birth. Some say Königsberg in Prussia (Starovoleci); others Königsberg in Franconia (Montucla); De Murr, in his 'Noticia trium Codicum,' afterwards referred to, says Unfind, near Königsberg, in the duchy of Saxe-Hilburghausen; while Doppelmayer and Niceron, followed by Delambre, say Königshofen in Franconia. His adopted name favours the supposition of his birthplace having been Königsberg.

When twelve years old he was sent by his parents to prosecute his studies at Leipzig, but whether he entered the university of that city does not appear. His progress in arithmetic, geometry, and astronomy is said to have been such, that before completing his sixteenth year he could meet with no one sufficiently learned to instruct him in these sciences, which induced him about 1452-53 to remove to Vienna, where he became the pupil and intimate friend of Purbach, who was at that time professor of astronomy in the University of Vienna. Under Purbach's direction he applied himself zealously to the Greek astronomy, through the medium of such Latin versions of the 'Almagest' as existed; and commenced a series of astronomical observations, including several eclipses and a conjunction of Mars, which last led to the detection of an error of two degrees in the Alphonsine Tables. Purbach had undertaken a new Latin translation of the 'Almagest,' but dying suddenly, the completion of the work devolved upon Müller. [PURBACH, GEORGE.] Upon Purbach's death (1461), Müller accepted the vacant professorship of astronomy in the University of Vienna, on condition of being permitted to reside for some time in Italy, in order that he might there, in compliance with Bessarion's suggestion, acquire a knowledge of the Greek language.

In 1461-62 he accompanied the cardinal to Rome, where he began the study of the Greek language, and occupied himself in collecting, collating, and copying Greek manuscripts, and making astronomical observations, chiefly of eclipses, and where also he made the acquaintance of George of Trebizond, who had anticipated him in a translation of the 'Almagest' from the original, though the work was very imperfectly executed. In 1463 Müller proceeded to Ferrara, where for about a year he continued his philological studies under Blanchini, Theodore Gaza, and Guarino, at the expiration of which time he accepted an invitation from the students of Padua to give in that city a course of instruction explanatory of the astronomical writings of the Arabian philosopher Alfragan. The introductory discourse, entitled 'Oratio in Prælectionem Alfragani Introductoria in Scientias Mathematicas,' &c., delivered by him on this occasion, was prefixed by Melancthon to his edition of Alfragan, published in 1537. From Padua he proceeded in 1464 to Venice to meet Bessarion, with whom he returned to Rome, and shortly afterwards returned to Vienna, where he entered upon the duties of his professorship. While in Italy he

composed his work entitled 'De Triangulis Planis et Sphaericis,' first published at Nürnberg in 1533, folio, fifty-seven years after the author's death, which is now the most interesting of his works. It contained two tables of natural sines, one to a radius 6,000,000, the other to a radius 10,000,000, and by their means all the cases of plane and spherical triangles were solved, without the aid of a similar table of tangents, the utility of which he did not perceive, and the consequence of which oversight was that the solutions, though occasionally very ingenious, are in most cases excessively prolix. The solution of that case of spherical triangles in which, the angles being known, it is thence required to determine the sides, was first given in this work. The trigonometry and the tables of sines appear to have been published separately. The title of the latter, according to Nicéron, was 'Compositio Tabularum Sinuum, cum Tabulis Duplicibus Sinuum ejusdem,' fol. Nürnberg, 1541. A detailed analysis of the trigonometry is given in the 'Astronomie du Moyen Age,' pp. 292-323 and 347. It affords, says Delambre, a very complete view of what was then known of plane and spherical trigonometry, though the discoveries in this branch of science, which belonged exclusively to Müller, were not of great importance. While in Italy he likewise detected many errors in Trebizond's version of the 'Almagest,' which he severely criticised. This excited so much animosity, that some have attributed Müller's early death to poison administered to him by one of the sons of Trebizond. (Vossius, 'De Scientiis Mathematicis,' p. 184.)

The earliest edition of Purbach and Müller's translation of the 'Almagest' appears to be that of Venice, fol. 1496. It was reprinted at Basel in 1543, and there are several subsequent editions. The title of the two editions mentioned is 'Joannis de Monte Regio et Georgii Purbachii Epitome in Cl. Ptolemæi Magnam Compositionem, continens Propositiones et Annotationes quibus totum Almagestum declaratur.' The first six books were the work of Purbach, who makes the length of the sidereal year 365 days, 6 hours, 9 minutes, 12 seconds, which is much nearer the truth than that given by his predecessors. He also states that the obliquity of the ecliptic given by Ptolemæus is  $23^{\circ} 51' 20''$ , but that in his own time he is unable to make it more than  $23^{\circ} 28'$ , though he does not say whether he considers the obliquity to be decreasing or Ptolemæus's result to be erroneous. In all the demonstrations sines are employed to the exclusion of chords. (Delambre.) Upon the whole, this epitome is supposed to have been chiefly extracted from the Latin version which Gerard of Cremona had made of the Arabic commentary of Geber on the 'Almagest.' It appears in effect that both Purbach and Müller rather divined the sense and seized the spirit of Ptolemæus than understood the letter of their text. The work was a model of precision; but nevertheless it was an abridgment, and an abridgment of Geber much more than of Ptolemæus. (Preface to the French translation of the 'Almagest,' by M. Halma, 4to, Paris, 1813.)

After some years' residence at Vienna, Müller was invited by the king of Hungary (Matthias Corvin) to take up his abode at Buda, where he amused himself with collating the Greek manuscripts which had been brought from Athens and Constantinople, and in constructing "tables of directions," in which he shows himself no less attached to astrology than to astronomy. The work is entitled 'Tabulæ Directionum Projectionumque, non tam Astrologiæ Judiciariæ quam Tabulis instrumenticis innumeris fabricandis utiles ac necessarie,' &c., 4to, Nürnberg, 1475. It contained the first tangents published in Europe, extended however only to each degree of the quadrant; but although similar tables had been constructed by the Arabs, and applied by them to trigonometry full 500 years earlier, Müller, as has been stated, was quite ignorant of this their chief use. The work is reviewed in the 'Astr. du Moyen Age,' pp. 238-292. It may here be observed that the term 'tangents' was not introduced till after the time of Müller. Both by him and Purbach, as by the Arabs, they were called 'shadows,' the length of the shadow of every object cast by the sun being in fact the tangent of the sun's zenith distance, the radius being the vertical height of the object. The state of Hungary induced him in 1471 to remove to Nürnberg, where he formed an intimacy with a wealthy citizen, Bernard Walter, at whose expense several astronomical instruments were constructed and a printing-office established. With these instruments a series of observations were made which afforded abundant proof of the inexactitude of the Alphonsine Tables. They were published in 1544 under the title of 'Observationes 30 Annorum a J. Regiomontano et B. Walthero. Scripta de Torqueto, Astrolabio Armillari, Regula magna Ptolemæica, Bæculoque astronomico,' 4to, Nürnberg. Müller's observations commence at Rome the 3rd of January 1462, and at Nürnberg the 6th of March 1472, and terminate the 28th of July 1475. Those of Walter begin the 2nd of August 1475, and end the 3rd of June 1504. Lacaille made use of these observations in the construction of his solar tables. ('Astr. du Moyen Age,' p. 337.) The appearance of a comet led him to compose a work entitled 'Problemata xvi. de Cometæ longitudine, magnitudine, et loco vero,' first published at Nürnberg in 1531, 4to, wherein he gives a method of determining the parallax of a comet, afterwards employed by Tycho Brahe, but which, observes Delambre, though true in theory, cannot be depended on in practice. ('Astr. du Moyen Age,' pp. 340-344.) Prior to 1475 he published his 'Kalendarium Novum,' for the three years 1475, 1494, and 1513 (the interval being an entire cycle of nineteen years), which was probably the first almanac that appeared in

Europe, though the idea was taken from a similar work composed by Theon of Alexandria. It gives the length of day at all places situated between the parallels of  $36^{\circ}$  and  $55^{\circ}$  N. lat., and for every three degrees of the sun's longitude. On the appearance of this almanac the King of Hungary presented Müller with 800 (some say 1200) crowns of gold; and such was the demand for it that, notwithstanding the price of twelve gold crowns, the whole edition was speedily disposed of in Hungary, Italy, France, and England. Besides the above works of his own composition, he had printed an edition of Purbach's 'Theory of the Planets,' the 'Poems' of Manilius, &c., and was proceeding with others, when Pope Sixtus IV., who contemplated a reformation of the calendar, purchased his services by appointing him Archbishop of Ratisbon. He immediately quitted his old patron Walter, and proceeded to Rome in July 1475, where he died on the 6th of July of the following year, in the forty-first year of his age. His body was interred in the Pantheon.

Müller, observes Delambre, was a man of remarkable sagacity, and of an ardent and enterprising disposition. He was without contradiction the most learned astronomer that Europe had then produced; though he was inferior to Albategnius as an observer, and to Aboul Wéfa as a calculator. It is matter of astonishment that, having recognised the advantage of employing tangents in some few particular cases, he should not have seen the importance of introducing them into ordinary calculations. He had shown the inaccuracy of the Alphonsine Tables, had contemplated their improvement, and had instituted a systematic course of observations for that purpose; time and leisure were alone wanting to the realisation of his views. His journey to Rome and premature death occasioned an injury to astronomy which it required a long interval to repair.

The following list of his works, not already mentioned, is taken from the list given by Delambre, in the 'Biog. Univers.' compared with that given by Nicéron. With the exception of the first two, they were all published after his death:—1, 'Disputationes contra Cremonensia in planetarum theoricis deliramenta,' Nürnberg, 1474, fol. 2, 'Tabula magna primi mobilis,' Nürnberg, 1475. 3, 'Almanach, ab anno 1489 ad annum 1506.' 4, 'In Ephemerides Commentarium,' Venice, 1513, 4to. 5, 'Tabulæ Eclipsium Purbachii. Tabulæ primi mobilis à Monteregeo,' Venice, 1515, fol. 6, 'Epistola de compositione et usu cujusdam meteoroscopii armillariorum,' Ingolstadt, 1533, fol. (appended to an edition of Apian's 'Introduction to Geography'). 7, 'Problemata 29 Saphæ nobilissimi instrumenti à J. de Monteregeo,' Nürnberg, 1534. (The Saphæ bore some resemblance to the Analemma.) 8, 'Mahometis Albategnii de Scientia Stellarum Liber, Latine ex Arabico per Platonem Tiburtinum versus, et additionibus aliquot Joannis Regiomontani illustratus,' Nürnberg, 1537, 4to (Nicéron). 9, 'De Ponderibus et aqueductibus, cum figurantibus Instrumentorum ad eas res necessariorum,' Marpurg, 1537, 4to. 10, 'Tabulæ Revolutionum,' 4to, n. d. 11, 'De Influentiis Stellarum,' Argentorati, 1538. 12, 'Problemata Astronomica ad Almagestum spectantia,' Nürnberg, 1541 (Nicéron). 13, 'Fundamenta operationum quæ fiunt per tabulam generalem,' Idem., 1557, fol.

Three manuscripts, in Müller's handwriting, came into De Murr's possession. One consisted of notes on the Latin version of Ptolemæus's Geography. The second was his defence of Theon against Trebizond. The third was entitled 'De Triangulis omnimodis Liber V.' Extracts from these were published by De Murr, under the title of 'Noticia trium Codicum autographorum Johannis Regiomontani,' Nürnberg, 1801, 4to. Müller's Letters were also published by De Murr in 1786, in his 'Memorabilia Bibliothecarum publicarum Norimbergensium et Universitatis Altdorfianæ,' tome i. pp. 74-205. See also 'Astron. du Moyen Age,' pp. 344-65. Weidler, in his 'Historia Astronomiæ,' pp. 310-13, gives a list of the works which issued from Müller's press at Nürnberg, and also of those which he contemplated publishing.

(Montucla, *Histoire des Mathématiques*, and the works above quoted. The reader may further consult the *Life of Müller* by Gassendi, appended to his *Life of Tycho Brahe*, Paris, 1654, 4to; Fabricius, *Bibliotheca Latina Medicæ et Infimæ Latinitatis*, tom. iv., p. 353; *Pauli Jovii Elogia*, No. 144.)

REGNARD, JEAN-FRANÇOIS, was born at Paris, according to most accounts, in 1647, though in a short biography prefixed to an edition of his works (Paris, 1818, 4 vols. 18mo), he is said to have been born in 1656. An only son and heir to considerable wealth, he received an education qualified to fit him for the position in life he was likely to occupy. The death of his father soon after he had completed his studies enabled him to gratify his desire for travelling. The first country that he visited was Italy, where he spent the year 1676, a date which, connected with other circumstances, renders it probable that 1656 was the real year of his birth. He revisited Italy a second time in 1678, on which occasion he formed an intimacy with the Eloise, whose memory he has consecrated in his pleasing little novel entitled 'La Provençale,' a work published after his death. This lady and her husband were induced by him to visit France, and for that purpose they all sailed from Civita Vecchia in an English vessel bound for Toulon. On the voyage however the vessel was captured by Algerine pirates, and Regnard and his companions were taken captives to Algiers. The adventures of their captivity form the basis of the novel above mentioned, and they are sufficiently interesting and romantic in themselves without the colouring of fiction. The only talent of Regnard

which became serviceable to him on that occasion, was one which his love for good fare had excited, and his wealth had enabled him to gratify, the skilful preparation of comestibles according to the most improved principles of Parisian cookery. His culinary abilities secured for him the good will of his master and the favour of the ladies of his household. During his captivity he was taken to Constantinople, where he remained two years. On his return to Algiers he was ransomed for a considerable sum by the French consul; a ransom which came most opportunely, as he was about to suffer the last penalty for an intrigue in which he had been detected. He took with him to France the chain he had worn as a captive, which he carefully preserved. His love of travelling however had not been abated by his unlucky adventures, and, on the 26th of April 1681, he set out from Paris on a journey over the north of Europe. On arriving at Stockholm, he was induced by the King of Sweden to visit Lapland. He journeyed thither by way of Tornea, ascended the river of that name, and reached the borders of the Frozen Ocean. On his return from Lapland he made a short sojourn at the court of Sweden, and, after having travelled over Poland, Hungary, and Germany, returned to Paris on the 4th of December 1683, where, satiated with the wandering life he had led, he determined upon settling. Having purchased some lucrative situations under government, he there devoted a part of his time to literary pursuits, but spent the greater part of it in the society of his friends, and in the enjoyment of the capital; the summer he was in the habit of passing on an estate which he had purchased near Paris. His devotion to gaiety and pleasure, as it was the means of lessening his utility and reputation as a writer, was likewise the cause of his untimely death, which occurred on the 5th of September 1710.

As a dramatic writer, the reputation of Regnard stands deservedly high; in comedy he is generally considered second only to Molière; and Voltaire has remarked that "no one can appreciate that great dramatist who feels no pleasure in reading Regnard." His finest and most perfect production is the comedy of '*le Joueur*,' written in 1696. Himself a gambler, he has given a dark but faithful colouring to the portraiture of a vice which had embittered his life, and he has translated his own sad sentiments on the subject into the language of the most beautiful and energetic poetry. His next best piece is '*le Légataire Universel*,' in five acts, in which the humour and the versification are alike deserving of admiration. Had Regnard produced many comedies of similar merit to the two which we have mentioned, he would have relieved French literature of the reproach which has often been made to it of having had no worthy successor to Molière. The fault into which he has fallen is that, like Piron, Gresset, and Marivaux, he has rather delineated an exaggerated representation of some particular vice or folly, than, like his great original, human nature in its every-day proportions. This fault however is still more conspicuous in the French dramatists who succeeded him, whose portraits are, in most instances, only coarsely drawn caricatures of nature.

The other dramatic writings of Regnard, in five acts, are,—1, '*Le Distrait*,' which appeared in 1697, and is taken from one of the characters of La Bruyère. This piece failed on its first representation, but was afterwards, in 1731, reproduced on the French stage with considerable success. 2, '*Démocrite*' (1700). 3, '*Les Ménéchmes*' (1705); a comedy dedicated by the author to Boileau on a reconciliation with him which his friends had effected; between these two poets there had been a long literary warfare [BOILEAU]. His shorter pieces are mostly in prose; the principal of them are—1, '*Le Divorce*,' in three acts (1688). 2, '*La Descente de Mezetin aux Enfers*' (1689). 3, '*L'Homme à bonnes Fortunes*' (1690); Regnard has also written a criticism on this comedy in a small piece of one act which was represented in the same year. 4, '*Les Filles Errantes*' (1690). 5, '*La Coquette*' (1691); all in three acts. 6, '*Les Chinois*' (1692), four acts, and several one-act pieces, such as '*La Sérénade*,' '*La Foire de St. Germain*,' &c. He also wrote an opera entitled '*Le Carnaval de Venise*' (1699), the music of which is by Campra, and a tragedy called '*Sapor*,' which has not been represented. His other writings are some Epistles and two Satires, one of them directed against Boileau, another against husbands, which have been much admired, besides several shorter poems. In prose he has composed a relation of his various travels, and the '*Provençale*' already alluded to.

REHOBAM, the son of Solomon, by Naamah, an Ammonitess, succeeded his father in B.C. 990, when he was forty-one years of age. The oppressive taxation levied by Solomon to carry on his magnificent buildings had occasioned much dissatisfaction among the people, and when the tribes had assembled at Shechem, having first sent for Jeroboam who had been banished to Egypt, they wished to place some restrictions on Rehoboam's power. To this he refused to consent, and replied to their representations with threats of increased severity. The consequence was that ten tribes abandoned him, and formed a new kingdom under Jeroboam [JEROBOAM], while he remained for the rest of his life king of Judah only. In the first years of his reign he adhered to the worship of his predecessors, and evinced his obedience to the divine command by disbanding, at the message of Shemaiah the prophet, an army which he had assembled in order to subdue Jeroboam. He fortified and garrisoned the cities of Judah and Benjamin, and for three years his reign was prosperous and peaceful. He then—probably induced by his mother—resorted to practices of the rankest and most disgusting idolatry. His punishment followed

quickly. In the fifth year of his reign Judah was invaded by an immense army commanded by Shishak, king of Egypt, or rather of Thebes, whose image may be seen in the British Museum. The fenced cities were taken with ease, and Jerusalem itself opened its gates to the conqueror. Rehoboam and his people repented, and at their prayer Shemaiah announced that Shishak would withdraw, which he did, but not until he had stripped the Temple of all its golden ornaments and treasures, which were afterwards replaced by brass ornaments by Rehoboam. He profited by the lesson, for idolatry is not mentioned as occurring again during his reign; and, except a few skirmishes with Israel, he continued in peace till his death in B.C. 973, when he was succeeded by his son Abijah. ABIJAH had no sooner begun to reign than he was attacked by Jeroboam, with an immense army, said to have numbered 800,000 men. After an animated speech by Abijah, in which he declared his dependence on the Lord, Jeroboam was defeated with the loss of 500,000; and Abijah captured several of the cities of Israel, among them Bethel, the city of the golden calf. But although on this occasion Abijah appears in a favourable light, it is recorded that he "walked in all the sins of his father." He died in B.C. 970, and was succeeded by his son Asa. [ASA.]

REICHA, ANTOINE-JOSEPH, a well-known composer, though more esteemed as a writer on music, was born at Prague in 1770, but educated at Bonn under his uncle, where he at first clandestinely studied the art passionately loved by him, and which soon became his profession; from which acknowledgment, made by himself, it is to be presumed that he was originally intended for a different pursuit. He early attempted musical composition, and when only seventeen years of age conducted the performance of his first symphony. In 1794 he went to Hamburg, and there remained five years, applying much to the abstruse theory of music, for which study his knowledge of algebra, a branch of mathematics wherein he was highly skilled, eminently qualified him. At the same time he also devoted great attention to the French language, in which he composed an opera in two acts, '*Obalda, ou les Français en Egypte*,' but it was not represented. In 1798 he proceeded to Paris, and at the celebrated concert '*de Cléry*' produced with decided success a grand symphony. In 1802 he removed to Vienna, where he resided six years, enjoying the friendship of Haydn and Beethoven, and wrote many of his works, and among them thirty-six fugues for the piano-forte, the whole edition of which was sold in the first year. He returned to Paris in 1808, and there remained till his decease, which took place in 1836.

M. Reicha was a member of the Institute in both its forms, and a leading professor of composition at the Ecole Royale de Musique. Among his numerous works, those on which his future fame will rest are, '*Cours de Composition, ou Traité complet et raisonné d'Harmonie Pratique*,' in 1 vol. fol.; and '*Traité de Mélodie, Abstraction faite de ses Rapports avec l'Harmonie*,' in 2 vols. 4to, 1814, both of which ought to be carefully studied by every musician who wishes to understand his art otherwise than empirically. His other works requiring notice were '*Traité de Haute Composition*,' 4to, 1824; '*Petit Traité d'Harmonie Pratique à deux Parties*,' 4to; '*Art du Compositeur Dramatique*,' 4to, 1833; and many articles on music in '*l'Encyclopédie des Gens du Monde*.'

REID, DR. THOMAS, was born April 26th, 1710, at Strachan in Kincardineshire, about twenty miles from Aberdeen, of which parish his father, the Rev. Lewis Reid, was minister for fifty years. He was first sent to the parish school of Kincardine; after two years he was removed to Aberdeen; and at the age of twelve or thirteen he entered the Marischal College of Aberdeen. The principles of the philosophy of which he afterwards became so able an advocate he imbibed here under Dr. George Turnbull, author of '*The Principles of Moral Philosophy*.' He continued beyond the usual time at the university, of which he had been appointed librarian. This office he resigned in 1736, and he then visited England in company with Dr. John Stewart, afterwards professor of mathematics in the Marischal College. They proceeded to London, Oxford, and Cambridge, and were introduced to several distinguished men. In 1737 Reid returned to Scotland, and was presented by King's College, Aberdeen, to the living of New Machar in Aberdeenshire. The parishioners being averse to the system of patronage which led to this appointment, were at first violently opposed to Reid; but his unwearied attention to his duties and the mildness of his temper soon overcame their opposition, and converted their dislike into the highest esteem. It appears however that he had been so little used to composition, and was naturally so diffident, that for some time he delivered very few of his own sermons, but used those of Archbishop Tillotson and Dr. Evans. In 1740 he married Elizabeth, daughter of his uncle Dr. George Reid, a physician in London.

While he was minister of New Machar, he pursued a course of intense study; and in 1748 he inserted in the '*Transactions of the Royal Society of London*' '*An Essay on Quantity*,' occasioned by a treatise in which simple and compound ratios are applied to virtue and merit. In other words, it was an essay on the application of mathematics to morals. Doctors Pitcairne and Cheyne had recently attempted to apply mathematics to medicine, and Hutcheson to morals. According to the latter, the good done by a man depends partly on his benevolence and partly on his dispositions; the relations between

these moral notions might be expressed algebraically, after this manner:—the benevolence or moral desert of an agent was analogous to a fraction, which had the good performed for the numerator, and the dispositions of the agent for the denominator. Reid, after examining in his essay the nature of mathematical proof, and the subjects to which it had been applied by Hutcheson, showed that mathematics could by no means have a necessary relation to morals, because the truths to which the two sciences respectively refer addressed themselves to different faculties of the mind. In 1752 the professors of King's College, Aberdeen, elected Reid to be their professor of moral philosophy. After this appointment he founded a private literary society, which met once a week, and its object was the discussion of philosophical subjects for the mutual improvement of the members, among whom were Doctors George Gregory, Campbell, Beattie, and Gerard, including of course the projector. Though Reid had as yet published nothing but the 'Essay' mentioned above, his character as a philosopher was established; and in 1763 the University of Glasgow invited him to succeed Dr. Adam Smith in the chair of moral philosophy. He entered upon its duties in 1764, in the discharge of which he laboured indefatigably to carry out his principles. In the same year he published his 'Inquiry into the Human Mind,' the substance of which he had previously delivered to his pupils at Aberdeen, and also read to the society just named. The principal object of this work was to counteract the influence of that scepticism which Hume had founded on the spiritual and ideal system of Berkeley. About the time that the 'Inquiry' was published, the author received the degree of D.D. from the University of Aberdeen. In 1773 he published, in Lord Kames's 'Sketches of the History of Man,' 'An Analysis of Aristotle's Logic.' In 1781 Dr. Reid withdrew from public labours; but he did not cease to pursue his favourite occupations. In 1785 he published his 'Essays on the Intellectual Powers,' of which the substance had been delivered, as he tells us, annually for more than twenty years to a large body of the more advanced students at Glasgow, and for several years before at Aberdeen. In 1788 came out his 'Essays on the Active Power of the Human Mind.' Dr. Reid does not appear to have published any more works than those already mentioned; but he gave his attention to various other subjects, both in his private studies and in relation to his college lectures. Upon commencing his duties at Glasgow, he divided his course into four parts, after the example of his predecessor, Adam Smith; the first part comprised metaphysics; the second, moral philosophy; the third, natural law; and the fourth, political rights. He also gave lectures on rhetoric. He read several essays at different times before a philosophical society of which he was a member. Among these were 'An Examination of Dr. Priestley's opinion concerning Matter and Mind;' 'Observations on the Utopia of Sir Thomas More;' 'Physiological Reflections on Muscular Motion.' The last essay was read by Dr. Reid to his associates a few months only before his death, which took place October 7, 1796, in the eighty-seventh year of his age. After his death, his 'Essays on the Intellectual and Active Powers' were published by Mr. Dugald Stewart, as 'The Philosophy of Dr. Reid,' with a life of the author prefixed, from which this account of him is chiefly taken.

The moral and social qualities of Dr. Reid were such as naturally to inspire esteem, and in private life no man could be more highly esteemed than he was. As a writer, his language is simple and manly, and his style clear and forcible, without any pretence to ornament. Opinions vary as to the merits of his philosophy. His aim was to arrive at the general laws which regulate our mental operations by the inductive method, which, he thought, had never been applied to this subject. He has the merit of showing the unsatisfactory nature of certain moral systems proposed by his predecessors, though it must be owned that he occasionally fails to perceive the real purpose of particular systems and lines of argument: indeed, Reid, as Hamilton remarks in one of his notes, "was but very superficially versed in the literature of philosophy." Whether he has himself laid the foundation of a system that will prove satisfactory is very doubtful. Perhaps the laws which regulate the material world will never be found altogether applicable to the operations of mind. In all attempts that have hitherto been made so to apply these laws, some conclusions have inevitably followed, which our sense of right and wrong refuses to admit, and this men will ever regard as a safer guide than any scheme of philosophy however ably propounded. As to Dr. Reid's view of Aristotle's logic, it appears only just to say that he probably never read Aristotle's logic in the original and did not clearly understand it. A new and collected edition of Reid's works, edited with Notes and Supplementary Dissertations by Sir W. Hamilton was in part published in 1846, but at Hamilton's death in 1856 the work was still incomplete. [HAMILTON, SIR WILLIAM.] The student of Reid should on no account omit to examine most carefully the notes of Sir William Hamilton.

\*REID, MAJOR-GENERAL SIR WILLIAM, K.C.B., F.R.S., was born in 1791, at Kinglassie in Fifeshire, being the eldest son of the Reverend James Reid, a clergyman of the Scottish Church. He was educated in the Royal Military Academy at Woolwich, and entered the army as a Lieutenant of Royal Engineers in 1809. He served under the Duke of Wellington in the Peninsula until the European peace, afterwards under General Lambert in America, and subsequently

under the duke again in Belgium. In 1816, having attained the rank of captain, he served in the expedition against Algiers, assisting in the operations connected with the bombardment of that place. For some years after this period he was adjutant of the corps of Sappers and Miners; and he became also one of those students of science, to whom the lectures delivered by the professors of the 'Royal Institution of Great Britain' have afforded opportunities of enlarging and correcting their early instruction, which have proved so important to many persons engaged in the active business of life. On Feb. 21, 1839, he was elected F.R.S. In 1838 as lieutenant-colonel he was appointed Governor of Bermuda; and in 1846 Governor of the Windward Islands. Great improvements in the agriculture of Bermuda were effected by him, and in both governments his firm and conciliatory conduct gained the confidence and good-will of the entire population. Two years afterwards he returned to England, and in 1849 was appointed commanding engineer at Woolwich. In 1850 and 1851 he directed the officers of Engineers and the Sappers and Miners, preparatory to and during the Great Exhibition. On the resignation of Mr. R. Stephenson, C. E. [STEPHENSON, ROBERT], Colonel Reid was requested by the Royal Commission to succeed him as chairman of the executive committee, to the duties of which office he gave unremitting attention until the close of the Exhibition. In September 1851 he was appointed Governor of Malta, and on the termination of his services at the Exhibition, for which he declined remuneration, received the honour of K.C.B., and shortly afterwards proceeded to Malta, the government of which he has continued to retain to this time (April 1857).

General Reid is the second in point of time of the investigators of laws of storms, to whom both science and navigation have become so greatly indebted during the last quarter of a century, and to whose labours a remarkable finish has been given, with respect to theory by the philosophical skill, first of Sir John Herschel, and more recently of Professor Dove of Berlin; while Mr. Dobson, in papers communicated to the British Association, has shown their influence as exciting, or rather permissive causes, of the explosions of fire-damp in coal-mines. A paper had been published in the 'American Journal of Science' by Mr. Redfield, and this was placed in the hands of Lieutenant-Colonel Reid, whose attention had been previously drawn to the subject when employed in Barbadoes as Major of Engineers, in re-instating the buildings ruined by the hurricane of 1831. Impressed with the importance of the subject, as well in its practical as in its scientific relations, he continued to devote much attention to it, and became convinced of the rotatory character and definite path which had been ascribed to these storms by Mr. Redfield. He embodied his views in an elaborate paper 'On Hurricanes,' occupying seventy pages of the second volume of the 'Papers on Subjects connected with the Duties of the Corps of Royal Engineers,' which was published in 1838. In the same year appeared his celebrated work, founded upon the contents of that paper, entitled 'An Attempt to develop the Law of Storms by means of Facts arranged according to Place and Time;' of which three enlarged editions have since been published. In 1849 he published 'The Progress of the Development of the Law of Storms and of the Variable Winds, with the Practical Application of the subject to Navigation.' The subject has also received the attention of Mr. Henry Piddington of Calcutta, and Mr. Alexander Thorn of Mauritius, both of whom have produced valuable works on the subject, and the former (from whom rotatory storms have received the appropriate and distinctive appellation of *Cyclones*), a series of investigations of Indian hurricanes in the journal of the Asiatic Society of Bengal, of the most precise character; while a peculiar theory of their origin and causes has been advanced by Mr. James P. Espy, a second American inquirer on this subject.

General Reid is also the author of many papers in the publication of the Royal Engineers already cited, and in the 'Philosophical Magazine,' some relating to professional topics and others on various subjects of natural science, chiefly physical and chemical. It is to him that the service, of which he is so distinguished an ornament, as well as the cultivators of science in several departments, are indebted not only for the original suggestion, but also for the plan of executing by officers of the Royal Engineers, of the valuable 'Aide-Mémoire to the Military Sciences' noticed in a former article. [PORTLOCK, JOSEPH ELLISON.] To this work Sir W. Reid was also a contributor.

REIMARUS, HERMANN SAMUEL, was born at Hamburg, December 22, 1694. Early in life he devoted himself to the study of languages, and he became distinguished for his knowledge of the Latin, Greek, and Hebrew. He pursued his studies at the university of Wittenberg, and upon the completion of his course, in 1717, he maintained some theses 'On the Differences of Hebrew Words,' which established his character for learning and acuteness. He then began to travel, and, having passed over several parts of Germany, he stayed a considerable time at Weimar, where he took the opportunity of publishing a collection of minor productions. Having returned to Hamburg, he was in 1727 made professor of philosophy in the university of that city, and he filled this office with much honour to himself during the space of 41 years. Reimaruss married in 1728, Johanna Frederica, the third daughter of the celebrated J. A. Fabricius. This connection with Fabricius proved to him the occasion of many and great advantages, and he also assisted Fabricius in some of his most

Canonum secundi libri Directionum qui in Regiomontani Opere desiderantur,' 4to, Tübingen, 1554. In this work the table of tangents was first extended to each minute of the quadrant from 0° to 89°, and to every 10' from 89° to 90°. The last figure of the tangents here given can nowhere be depended on, and above 70° the error is much greater. Like Müller, he showed himself very little acquainted with the use to which such a table is applicable, notwithstanding the epithet "fœcundus" which they applied to it. Reinhold supposed, with Copernicus, that the obliquity of the ecliptic varied from 23° 28' to 23° 52'. 5. 'Tabulæ Ascensionum Obliquarum à 60° Gradu Elevationis Poli usque ad Finem Quadrantis, per Erasmum Reinholdum supputatæ,' appended to the edition of Müller's 'Tables of Directions,' printed in 1584. 6. There is also an anonymous work, printed in 1568, 8vo, entitled 'Hypotyposes Orbium Cælestium quas vulgo vocant Theoricæ Planetarum Congruentes cum Tabulis Astronomicis,' which is supposed to be the composition of Reinhold. See 'Astron. Moderne,' i., pp. 142 and 146. ('Astronomie du Moyen Age,' pp. 272-274; 'Astron. Moderne,' i., p. 164; Zedler, 'Grosses Universal Lexicon,' fol., Leipz., 1742, band 31, p. 206; Vossius, 'De Scientiis Mathematicis,' c. 36, p. 14; Dappelmayer, 'De Mathem., &c.')

REINHOLD, ERASMUS, son of the preceding. He possessed some knowledge of astronomy, and submitted to Tycho a copy of the Prutenic Tables calculated to each 10'; but the want of fortune obliged him to adopt the medical profession.

REISKE, JOHANN JACOB, a physician, and celebrated scholar, whose fame rests chiefly on his knowledge of the Arabic, was born on the 25th of December 1716, at Zorbig, a small town near Leipzig. His grandfather was an innkeeper, and his father a tanner. At the age of twelve he was sent to the orphan-school at Halle, and was entered at the University of Leipzig in 1733, where, being destined by his relations to the theological profession, he spent five years chiefly in the study of the rabbinical writings and Arabic. He was soon induced to renounce the first of these pursuits, but he became extremely devoted to the second; and his passion for Arabic books was so strong that he almost deprived himself of the common necessities of life in order to purchase them. The learned Wolf of Hamburg having, in 1736, sent him the 'Narrations' of Hariri, he copied it with great eagerness, and in the following year printed at Leipzig the twenty-sixth 'Consensus' with Arabic scholia and a Latin version. The success of this essay caused him to take the resolution, contrary to the advice of his friends, of going to Holland for improvement in the Arabic language. He ransacked all the Oriental treasures of the library at Leyden, whilst for his subsistence he was obliged to become a corrector of the press. He passed his time in a state of indigence and discontent that brought upon him hypochondriac affections, the effects of which never left him. During his stay at Leyden, he made use of the advantages the place afforded for the study of medicine, and on his return to Leipzig he was presented with a gratuitous degree of Doctor of Physic; but his manners and habits were altogether unsuited for the obtaining of professional practice. Poverty was his perpetual companion, and his scanty resources were derived from correcting the press, translating, and performing other tasks for book-sellers. His condition soured his temper, and he made many enemies by the severity of his censures. In the meantime, many valuable works in Oriental and Greek literature were occasionally proceeding from his pen, which made him well known to the learned world, and he was at length nominated rector of the college of St. Nicholas in Leipzig. Thus placed in happier circumstances as to fortune, he pursued his literary labours more according to his inclination, and fulfilled the duties of his office with exemplary diligence. At the age of forty-eight he married Ernestine Christine Müller, a young woman of twenty-nine, noticed below, who was afterwards of great use to him in his editorial employments. He died on the 14th of August 1774.

The following is a list of some of the most valuable of his works, beginning with those on Oriental subjects:—1, 'Miscellanæ aliquot Observationes Medicæ ex Arabum Monumentis,' 4to, Lugd. Bat., 1746, a little work of much importance to all who take an interest in the Arabic physicians, which was republished after Reiske's death by Christ. God. Gruner, 8vo, Halle, 1776. 2, 'Abulfedæ Opus Geographicum.' This translation of the Geography of Abulfeda is to be found in Büsching's 'Magazin für die neue Historie und Geographie,' vols. iv. and v., Lips. 1770, 8vo. Unfortunately Reiske did not possess sufficient mathematical knowledge to understand the systematic part of such a work. 3, 'Proben der Arabischen Dichtkunst in verliebten und traurigen Gedichten, aus dem Motanabbi, Arabisch und Deutsch, nebst Anmerkungen,' Leipzig, 1765, 4to. This contains only a part of the poems of Motanabbi, the whole of which he had copied out during his residence at Leyden, and wished to publish. A German translation of the whole of his poems is among his unpublished manuscripts. 4, 'Abulfedæ Annales Moslemici,' Leipzig, 1754, 4to. This volume contains the translation of the Annals of Abulfeda [ABULFEDA], from the birth of Mohammed to A.H. 406 (A.D. 1015-16): it is scarcely two-fifths of that part of Abulfeda's work which treats of the history of the Mohammedans. Reiske did not translate the first part of this work, which has for its object the history of the time anterior to Mohammed. His other works consist of editions of various classical authors, as 'Constantinus Porphyrogenetus,' Gr. et Lat., fol., Lips., 1751, 1754; 'Ciceronis Tusculanæ Quæstiones,' 12mo, Lips., 1759;

'Theocritus,' Gr. et Lat., 4to, 2 vols., Lips., 1766; 'Oratores Græci,' Gr. et Lat., 8vo, 12 vols., Lips., 1774-75; 'Plutarchi Opera Omnia,' Gr. et Lat., 8vo, Lips., 12 vols., 1774-82, of which only the first appeared during his life; 'Maximus Tyrius,' Gr. et Lat., 8vo, 2 vols., Lips., 1774; 'Dionysius Halicarnassensis,' Gr. et Lat., 8vo, Lips., 6 vols., 1774-77, of which the last four were published after his death. Some of these latter works, as well as several translations, were hastily executed in order to gain a livelihood, and most of them have been superseded by more recent and accurate editions. A complete list both of his published works and his manuscripts is given by Reiske's wife, in her continuation of his memoirs, which were published at Leipzig, 8vo, 1783, under the title, 'J. J. Reiskens von ihm selbst aufgesetzte Lebensbeschreibung,' pp. 816. His knowledge of Greek was considerable, and he is universally allowed to have been one of the best Arabic scholars that ever lived; in both these languages however he is much too bold and hasty a critic to be implicitly trusted, and his alterations and conjectures are frequently unnecessary and absurd.

REISKE, ERNESTINE CHRISTINE, whose maiden name was Müller, the wife of the preceding, and a woman of great literary accomplishments, was born on the 2nd of April 1735, at Kumberg, a small town near Wittenberg in Prussian Saxony. In 1755 she became acquainted with Reiske at Leipzig, where she was paying a visit, and notwithstanding that he was twenty years her senior, they conceived a mutual love and esteem for each other; owing however to the war which raged all over Saxony, they were not married till 1764. This union, which contributed so much to Reiske's happiness during the rest of his life, was also of service to the cause of literature, and Christine Reiske deservedly occupies a distinguished place in the list of learned women. In order to help her husband by dividing with him his literary labours, she acquired under his instructions such a knowledge of Latin and Greek that she was soon able to understand the writers in those languages. From this time she was of the greatest assistance to him: she copied and collated manuscripts for him, arranged the various readings that he had collected, and read and corrected the proof sheets of his works. Her attachment for him and her respect for his memory are strongly shown in the supplement to his 'Autobiography,' which she completed, from the 1st of January 1770, to the time of his death in 1774. The gratitude of Reiske, and the ardour of his affection for one who lived only for him, are not less strongly expressed both in the 'Autobiography' just mentioned and in the prefaces to some of his works. On the occasion of his publishing his 'Demosthenes,' we have the following interesting note by his wife in his 'Memoirs':—"When the work went to press, only twenty thalers of the subscription money had come in. The good man was quite struck down with this, and seemed to have thrown away all hope. His grief went to my soul, and I comforted him as well as I could, and persuaded him to sell my jewels, which he at length came into, after I had convinced him that a few shining stones were not necessary to my happiness." After her husband's death she published several works that he had left unfinished, namely, the last three volumes of the 'Oratores Græci,' 8vo, Lips., 1775; 'Libanii Sophistæ Orationes et Declamationes,' Altem., 4 vols. 8vo, 1783-87, Græce; 'Dionis Chrysostomi Orationes,' Græce, 2 vols. 8vo, Lips., 1784. She also published two works herself, one at Mitau, 2 vols. 8vo, 1778-79, with the title of 'Hellas,' and another entitled 'Zur Moral: aus dem Griechischen übersetzt von E. C. Reiske,' 8vo, pp. 364, 1782, Dessau and Leipzig, containing several moral works, translated by her from the Greek into German. Concerning this last work see the 'Bibliotheca Critica,' by Wytenbach (part viii. page 142), Amstel., 1783. She also gave to M. Boden, for his edition of the Greek romance of 'Achilles Tatius' (8vo, Leipzig, 1776), the various readings of a manuscript collated by herself. After her husband's death she lived successively at Leipzig, Dresden, and Brunswick, and died at her native town, Kumberg, of apoplexy, on the 27th of July 1798.

RELAND, ADRIAN, was born at Ryp, a village in North Holland, on the 17th of July 1676. His father was a minister of that village, but afterwards removed to Amsterdam, where Reland was educated. He made such progress in learning that at eleven years of age he had passed through the usual classical course. The next three years he spent in making himself acquainted with the Hebrew, Syriac, Chaldean, and Arabic languages, under the tuition of Surenhusius. At fourteen he was sent to Utrecht, where he studied under Gravius and Leusden, and three years after was admitted to the degree of Doctor in Philosophy, on which occasion he sustained a thesis, 'De Libertate Philosophandi.' At seventeen he entered upon a course of divinity, under the direction of Herman Witsius and others; but he did not abandon the Oriental languages, which were always his favourite studies. After a residence of six years at Utrecht he removed to Leyden, and soon after the Earl of Portland chose him as preceptor to his son. In 1699 he was elected professor of philosophy at Harderwick, but did not continue long in that situation; for the University of Utrecht, on the recommendation of King William, offered him the professorship of Oriental languages and ecclesiastical history, which he readily accepted, and filled with high reputation during the remainder of his life. He died of the small-pox at Utrecht, on the 5th of February 1718, in the forty-second year of his age. He wrote and published a great number of works on sacred and Oriental learning, the chief of which are the

following:—‘*De Religione Mohammedica Libri Duo*,’ 12mo, Utrecht, 1705, a second edition of which, with many additions, was published at the same place, 12mo, 1717; ‘*Dissertationum Miscellanearum Partes Tres*,’ 12mo, 1706, 1707, 1708. These three parts, which are not always found together, comprise thirteen dissertations upon various subjects, more or less connected with eastern history and antiquities, with the exception only of one, treating of the languages of America. ‘*Analecta Rabbinnica*,’ 8vo, ib., 1702; ‘*Antiquitates Sacre Veterum Hebræorum*,’ 12mo, 1708; ‘*Dissertationes quinque de Nummis Veterum Hebræorum*,’ &c.; ‘*De Spoliis Templi Hierosolymitani in arcu Titiano Romæ conspicuis*,’ 12mo, 1716; ‘*Oratio pro Lingua Persica*,’ 4to, ib., 1701; and a dissertation on the Marbles of Puteoli, 12mo, ib., 1709. But his greatest work, and that in which his learning of the eastern languages shines most conspicuous, is ‘*Palestina ex Monumentis Veteribus illustrata et Chartis Geographicis accuratioribus illustrata*,’ which appeared first at Utrecht, 2 vols. 4to, 1714, and was reprinted at Nürnberg, 1716. Besides the above works Reland wrote many others, as the ‘*Dissertatio de Philippo Imperatoris Paris et Filii credito temere Christianismo*,’ a funeral oration to the memory of Mary, wife of William III. of England, a dissertation on the progress of philosophy at the beginning of the 18th century, &c.

REMBRANDT, GERRITZ, commonly called REMBRANDT VAN RYN, or RHYN, was the son of Hermann Gerritz, a miller. He was born on the 15th of June 1606, in his father's mill on the banks of the Rhine near Leyden, whence the agnomen van Ryn. When very young he was sent to a Latin school at Leyden; but he showed such a distaste for learning that his father gave up the idea of making a scholar of him, and consented to his becoming a painter, as he had manifested a decided talent for it. Young Rembrandt was accordingly placed first with Jacob van Zwaanenburgh, or, according to another account, George Schooten. He remained with his first master about three years. He then studied for a short time under Peter Lastman at Amsterdam; and lastly, for a short time, under Jacob Pinas; but he formed a style peculiarly his own. After leaving Pinas he returned to his father's mill, where he commenced painting, taking the immediate vicinity and the peasants of the neighbourhood as his standard of nature, and applying himself enthusiastically to his work. He had not finished many pieces before he was considered as a prodigy by his friends, and he was persuaded by them to take one of these early productions to a dealer in the Hague, who, to his no greater joy than astonishment, gave him 100 florins (about eight guineas) for his performance. Rembrandt was so elated with this unexpected good fortune that he posted home to his father in a chariot to convey the joyful intelligence. From this time he rapidly acquired both fame and fortune. In 1630 he settled in Amsterdam, where he resided the remainder of his life, and shortly afterwards married a handsome peasant-girl of Ramsdorf, whose portrait he has often painted. His reputation now became so great that he had many scholars, each of whom paid him annually 100 florins, and he so arranged their studies as to make them as profitable as possible to himself; he retouched the copies which they made from his own works, and sold them as originals.

This rapid and unexpected good fortune appears to have engendered in Rembrandt a love of money. He is said to have resorted to various mean expedients for acquiring wealth, though it appears to be ascertained that the common story of his miserly habits is incorrect. He sold impressions of his etchings, which were the principal source of his income, before they were finished, when finished, and afterwards with slight alterations; and such was the rage after his works, that collectors thought it incumbent upon them to possess impressions of his various etchings in all their different stages; and he is said to have thrown off from some plates as many as seven proofs, all varying but very slightly. Various absurd and mean practices are reported of him, probably without much truth; but he was a man who could endure no restraint upon his manners or his conversation; polite society was to him intolerable, and he always avoided it. The burgomaster Six was the only man of rank with whom Rembrandt associated, and with him he occasionally passed a few days in his house in the vicinity of Amsterdam, in which the burgomaster had fitted up a painting-room for him.

According to Sandrart, Rembrandt realised an annual income of nearly 2500 florins (about 200*l.*) from the sale of the copies made from his works by his pupils; and the traffic in his etchings alone, independent of the labours of his own pencil and his pupils' fees—a large amount of itself, but which added to the rest must have made a princely income for those times; yet in 1656 he was declared bankrupt, and his property remained under legal control as an insolvent debtor till his death. It may serve to illustrate the high value attached to his works to mention that the celebrated print of ‘*Christ Healing the Sick*,’ commonly called the ‘*Hundred Guilders*,’ received its denomination from the fact that he refused to sell it for less than that amount—about eight guineas. This plate was bought by Alderman Boydell, who destroyed it after he had taken a few impressions from it, which enhanced the value of the prints accordingly. A good impression is worth upwards of 60 guineas.

Rembrandt's best etchings realise enormous prices, both the portraits and the historical pieces varying from 30 to 100 guineas. The most remarkable portraits are those of the burgomaster Six; Van Copenhol,

the writing-master; Van Thol, the advocate; Uytenbogaert, the minister; and Uytenbogaert, the gold-weigher.

Rembrandt's great power was portrait; his pictures of that class are in the mass incomparably superior to his historical pieces, which though wonderful for their effects of light and shade, exhibit frequently an utter want of taste in design. Instead of acquiring fame in the ordinary way by any merits or beauties of form, Rembrandt commanded it, in spite of drawing the most coarse and incorrect through a rich and brilliant colouring, a consummate mastery of chiaroscuro, and not unfrequently a power of composition that has seldom been surpassed. Rembrandt is supposed to have acquired his peculiar taste for a brilliant concentration of light from an appearance that he had been familiar with from his infancy in his father's mill, where a strong beam of light coming from a small and lofty aperture cast on the surrounding objects that peculiar tone which we see so happily illustrated in his pictures. He arranged the light in his own painting-room upon similar principles, and generally fixed a drapery behind his sitter of such colour as he intended to paint the ground.

Rembrandt had a contempt for the antique; and the ordinary cant of connoisseurs about grace, sublimity, and grandeur only excited his ridicule. His antiques, as he used to call them, were some old pieces of armour, unique weapons, curious turbans, and various antiquated articles of dress, which he procured from Polish Jews, and with which he almost indiscriminately clothed individuals of all nations, ancient and modern. Rembrandt's taste led him to imitate certain effects of nature, and in the truth and power with which he gave these effects, both in his paintings and his etchings, he has seldom been equalled, and never surpassed. The prevailing light of his portraits is that of a brilliant sunset, and a rich golden tone of colouring pervades all his works. His originality is perhaps even more conspicuous in his etchings than in his paintings; he exhibited powers of the etching-needle before unknown; many of his plates are prodigies of chiaroscuro; and there is a softness and reality about them which we look for in vain in the works of other masters. It is said that he made a great secret of his mode of etching, and never allowed any one to see him at work. Most of his more important plates have evident traces of the dry point.

Rembrandt, at the beginning of his career, bestowed great labour on his pictures, and, in the manner of the generality of the Dutch painters, wrought them up to a very high finish. ‘*The Woman taken in Adultery*,’ in the National Gallery, is probably his best picture in this style. At a later period of life his whole attention was given to the effect; and his pictures, although still greatly laboured, had the appearance of having been executed with a remarkable freedom and boldness of touch; this is particularly the case with his portraits, some of which have an astonishing body of colour in the lights. When this roughness was objected to by any one, he was in the habit of saying that he was a painter, not a dyer; and when visitors ventured to examine his pictures too closely, he used to tell them that the smell of paint was unwholesome.

Rembrandt died at Amsterdam in October 1669. He had one son, Titus, who inherited his property, which, according to Descamps, was considerable. Titus was the pupil of his father, but being Rembrandt's son was the only distinction he ever enjoyed. Original Rembrandts are very valuable; some are estimated at several thousand pounds. They are scattered all over Europe, and this country possesses many; those in the National Gallery are all particularly fine specimens; the gallery of Dresden also possesses several of his master-pieces. The pictures by Rembrandt in the National Gallery are—‘*The Woman taken in Adultery*,’ ‘*The Adoration of the Shepherds*,’ ‘*A Landscape, with Tobit and the Angel*,’ ‘*Christ taken down from the Cross*,’ a sketch in oil; ‘*A Woman Bathing*,’ ‘*Portrait of himself*,’ ‘*Portrait of a Jew Merchant*,’ ‘*A Capuchin Friar*,’ ‘*A Jewish Rabbi*,’ ‘*Portrait of a Girl*,’ ‘*Portrait of a Man*,’

Descriptive catalogues of his works were published by D. Daulby, Liverpool, 1796; by A. Bartsch in 1797; by Nagler and others. There is a very extensive and remarkably fine collection of Rembrandt's etchings in the British Museum.

RÉMUSAT, JEAN-PIERRE-ABEL, a celebrated orientalist and professor of Chinese and Tartarian languages in the Collège de France, was born at Paris on September 5, 1788. A fall in his infancy placed his life in danger, and necessitated an absolute repose for several years, but occasioned the loss of the use of one of his eyes. He at first studied for the profession of medicine, but he soon commenced the study of oriental languages, and rapidly acquired great proficiency in both these departments of knowledge. The death of his father in 1805 left him with his mother dependent on him for support, when he successfully commenced the practice of medicine in Paris; but a Chinese work on botany so greatly excited his curiosity, that without a master, and only assisted by the grammar of Fourmont, he taught himself the language in order to read the explanations of the plates. In 1811 he published an ‘*Essai sur le Langue et la Littérature Chinoises*,’ which attracted much attention. In 1813 he received the degree of Doctor of Medicine, and in 1814 distinguished himself by the zeal and skill with which he attended the patients suffering from epidemic typhus in the hospitals of Paris. In 1814 the Collège de France instituted for him the professorship of Chinese. The loss of

an eye, and being the only son of a widow, exempted him from the ordinary conscription, but in 1814, when the allied armies entered France, there was a danger of his being called upon, but Napoleon I., through the intercession of M. Silvestre de Sacy and the Duc de Feltre, granted him a special exemption on account of his learned labours. In 1818 he succeeded M. Visconti as editor of the '*Journal des Savants*,' and in 1824 he was appointed keeper of the oriental manuscripts in the royal library. His known adherence to the party of Charles X. occasioned a probability of his being displaced when that monarch was dispossessed, but in acknowledgment of his peculiar fitness he was allowed to retain his offices. He died on June 3, 1832. His principal works are a translation from the Chinese of a '*Livre des Récompenses et des Peines*,' 1817; '*Recherches sur les Langues Tartares*,' 1820, in which he has given the best view hitherto presented of the Manchow, Mongol, Oujin, and Thibetian languages; '*Éléments de la Grammaire Chinoise*,' 1722; '*Mélanges Asiatique*,' 1825, continued in 1829 as '*Nouvelles Mélanges Asiatiques*,' these contain many of the papers which had previously appeared in the '*Journal Asiatique*,' '*Journal des Savants*,' '*Mines de l'Orient*,' '*La Biographie Universelle*,' &c. The novel of 'Yu-Tiao-li, ou les deux Cousines,' and '*Contes Chinois*,' 1827; and a posthumous work, '*Fou-kou-ki, ou Relation des Royaumes Bouddhiques*, traduit du Chinois et commenté, revu par Klaproth et Landresse,' 1836, besides numerous detached papers in various periodical works, some of which were afterwards published separately. He was also member of various learned societies, among them the Asiatic Societies of London and Calcutta. His life has been written by M. Silvestre de Sacy.

RENAUDOT, EUSEBIUS, was born at Paris in 1646. His father was first physician to the dauphin of France (afterwards Louis XIV.). Renaudot was educated at the Jesuits' college, and entered the congregation of the Oratoire, though he did not remain long in it. From his early youth he was particularly inclined to the study of the Arabic, Syriac, and Coptic languages, by means of which he was afterwards enabled to enter so deeply into the origin and history of the Eastern church. He became well known at court, where his vast learning made him much esteemed and admired, and Colbert being then desirous of establishing printing-presses for the Oriental languages at Paris, consulted him upon the subject, engaged his services, and offered him the reversion of a place in the Royal Library; but that minister having died before his views could be realised, Renaudot was not appointed to the vacant office. He seems however to have been employed by the king in various negotiations with the governments of England and Spain, his time being so much taken up by these occupations, that, while they lasted, he almost entirely discontinued his favourite studies. In 1689, he was made a member of the French Academy, and, three years after, of that of the '*Inscriptions et Belles-Lettres*.' In 1700 he accompanied to Rome Cardinal de Noailles, archbishop of Paris, and acted as his '*conclavista*' in the conclave which elected Clement XI. to the papal dignity. While at Rome, Renaudot resumed his favourite studies, and the library of the Vatican furnished him with ample materials for the history of the Eastern church—a subject which he had long in mind, and to which he now devoted his whole attention. In this design he was assisted by the new pope, who persuaded him to remain in Rome several months after the departure of Cardinal de Noailles, and gave him the priory of Frossey in Bretagne. On his return to France, Renaudot devoted himself entirely to letters, and composed a great number of learned dissertations, which are printed in the '*Memoirs*' of the Academy. He died in 1720, at the age of seventy-four, greatly regretted by the learned men of his time. His fine and extensive collection of Oriental manuscripts he bequeathed to the abbey of St. Germain des Prés. They remained there until the Revolution, when they were incorporated with the Oriental collection in the Royal Library. Renaudot wrote the following works:—1, A collection of controversial pieces on the celebrated work by Nicole, entitled '*Défense de la Perpetuité de la Foi contre les Monuments authentiques de la Religion des Grecs*,' Paris, 8vo, 1708; 2, '*Historia Patriarcharum Alexandrinorum Jacobitarum*,' &c., Paris, 4to, 1713; 3, '*Liturgiarum Orientalium Collectio*,' Paris, 2 vols. 4to, 1716; 4, '*Ancient Account of India and China*,' written by two Mohammedan travellers of the 9th century, translated from the Arabic, Paris, 8vo, 1718. This has subsequently been found to be only a translation of part of a geographical and historical work, entitled '*Murāju-dh-dhabab wa Mādānu-jauhar*' ('*Meadows of Gold and Mines of Gems*'), by the celebrated Masūdī, an Arabian writer of the 10th century. 5, '*Gennadii Patriarchæ Constantinopolitani Homiliæ de Eucharistia*,' together with other Latin treatises on the same subject, Paris, 4to, 1703.

RENÉ OF ANJOU, born in 1409, was the son of Louis II., duke of Anjou and count of Provence. In 1434 he succeeded his brother, Louis III. Before this time, René had married Isabella of Lorraine. After the death of Queen Joanna II. in 1435, René laid claim to the kingdom of Sicily and Naples, but he had a powerful rival in Alfonso of Aragon. [ALFONSO V.; JOAN II.] René was then a prisoner of the Duke of Burgundy, who opposed his succeeding to the inheritance of Lorraine, which he also claimed after the death of the duke, his father-in-law. He sent however his wife Isabella to Naples with her younger son Louis. She was received with acclamations by the old and numerous partisans of the house of Anjou. Alfonso of Aragon

was then a prisoner in the hands of Filippo Maria Visconti, duke of Milan, but soon after having recovered his freedom he repaired to South Italy to dispute the crown of Naples with his rival. In 1438 René proceeded to Naples, and a desultory warfare was carried on for three years in the Abruzzo and other provinces of the kingdom. The death of the Condottiere Caldora, René's best officer, decided the struggle in favour of Alfonso, who laid siege to Naples, and took it in 1442. René escaped on board a Genoese vessel to Provence. He was the last of the dynasty of Anjou who sat on the throne of Naples. In 1445 René gave his daughter Margaret in marriage to Henry VI. of England, on which occasion he obtained the restoration of his territories of Anjou and Maine, which were in the possession of the English. René now resided sometimes at Angers and occasionally at Aix in Provence, occupying himself with the administration of his territories, and also with the arts of painting, poetry, and agriculture. He wrote several works both in prose and verse, among others one on tournaments, the manuscript of which, enriched with drawings, is preserved in the National Library at Paris. In 1449-50 René attended Charles VII. of France in his successful war against the English, after which he returned to his dominions to pursue his favourite occupations. His eldest son John attempted to take Naples from Ferdinand of Aragon, who had succeeded Alfonso, but his enterprise failed. In 1473 Louis XI. of France seized Anjou under some pretence, and René retired to Aix in Provence, where he died in 1480, regretted by his subjects, among whom he has retained the enviable appellation of '*le bon Roi René*,' for he continued to style himself King of Sicily and Jerusalem. He introduced several useful trees and plants into Provence, among others the muscadel grape, and encouraged manufactures of woollens and glass. A '*Précis Historique*' of his life was published by Boisson de la Salle (Aix, 1820), and a marble statue was raised to his memory in one of the squares of Aix in 1823. René's sons having died before him, he was the last representative of the house of Anjou, and after his death Provence was united to France. Bargemont, vicomte de Villeneuve, published a '*Histoire de René d'Anjou, Roi de Naples, Duc de Lorraine, et Comte de Provence*,' Paris, 1825.

RENNELL, JAMES, born near Chudleigh in Devonshire in 1782, entered the navy at an early age as a midshipman. His father was a captain in the artillery. Young Rennell went with Admiral Parker to India, and rendered some effectual service at the siege of Pondicherry. At the age of twenty-four he quitted the navy, and entered the corps of engineers in the service of the East India Company. He distinguished himself in the campaigns of Lord Clive, received some severe wounds, and was promoted to a majority. It was during this period that he produced his first work, '*A Chart of the Bank and Currents of Cape Agulhas*,' the most southern point of Africa. While he was stationed in Southern Africa, he surveyed Adam's Bridge and the Paumbeen Passage between the island of Ramisseram and the continent, and he expressed his conviction of the practicability of widening the passage for ships. This suggestion has been lately acted upon, after a lapse of seventy years. While he held the appointment of surveyor-general of Bengal he published his '*Bengal Atlas*,' with an account of the Ganges and the Brahmapootra, in which he conjectured that the Sampoo of Tibet was the main feeder of the latter river. On his return to England in 1782 Major Rennell published a Map of Hindustan, accompanied by a '*Memoir*,' 4to, 1788. He was also elected member of the Royal Society, and became intimate with Dr. Vincent, Sir William Jones, Dr. Horsley, bishop of St. Asaph, and other learned men of his time. In 1793 he published '*Marches of the British Army in the Peninsula of India during the Campaigns of 1791*.' He also published '*Memoir of a Map of the Peninsula of India*, exhibiting its Natural and Political Divisions, the latter conformably to the Treaty of Seringapatam of March 1792,' and also '*Elucidations of African Geography*, from the Communications of Major Houghton and Mr. Magra in 1791, with a Map.' In 1794 Major Rennell published a political pamphlet, entitled '*War with France the only Security of Great Britain at the present Momentous Crisis*, by an Old Englishman.' The French Convention had already placed themselves out of the pale of international law by their resolutions of the 19th of November 1792, in which they offered their aid to any people in any country of Europe who wished to overthrow the existing government. In 1798 he assisted Mungo Park in the arrangement of his African travels, and illustrated his work by a map and a memoir in the appendix. His next work, and that by which he is most generally known, was '*The Geographical System of Herodotus examined and explained*,' 4to, 1800. He also wrote:—1, '*Observations on the Topography of the Plain of Troy*,' 2, '*A Treatise on the Comparative Geography of Western Asia*,' with an Atlas, a work of great labour and research; 3, '*Illustrations, chiefly Geographical, of the History of the Expedition of the younger Cyrus from Sardis to Babylon, and the Retreat of the Ten Thousand*,' 4, '*An Investigation of the Currents of the Atlantic Ocean, and of those which prevail between the Indian Ocean and the Atlantic*.' For this important work he examined and collated the log-books of all the ships of war and Indianmen which had traversed those seas during the last thirty or forty years, recomputing their observations and reducing them to one general system. The results of all this prodigious labour were ready for the press at the time of his death, and were shortly afterwards published by his daughter, Lady Rodd,

in several large charts, showing by an infinite number of arrows the direction and force of the currents throughout the Atlantic Ocean, and accompanied by a thin volume which ought to be studied by every seafaring person. More recently Lieutenant Maury, superintendent of the Washington Observatory, has, with the sanction of the United States government, largely extended the range of observations by procuring the logs of a vast number of vessels, and has methodised and simplified the results. Major Rennell also wrote some papers in the 'Transactions' of the Royal and Antiquarian Societies, such as a disquisition on the Melita island of St. Paul's voyage; the place of Julius Caesar's landing in Britain, in which he proves that the principal mouth of the Thames was then to the southward of the Isle of Thanet, &c. Major Rennell died on the 29th of March 1830, and on the 6th of the following April his remains were interred in Westminster Abbey, where a tablet with an appropriate inscription is placed over his tomb. Biographical notices of him were inserted in the periodicals of the time, in which both his public and his private character were spoken of in those terms of praise which he justly deserved.

The merits of Major Rennell as a laborious investigator and an acute critic are universally acknowledged. Love of truth, patient and persevering research, and sound judgment, are eminently displayed in all that he did. It is a matter of surprise, with the limited means at his command, that he accomplished so much in the department of comparative geography; and though we are now enabled by new discoveries to rectify many of his conclusions, the results to which he did attain will always remain as evidence of his unrivalled sagacity. His 'Geographical System of Herodotus' is a monument worthy of the writer whom he illustrated. Though unacquainted with the Greek language, and obliged to trust to the very inaccurate version of Beloe, he succeeded in producing a commentary on a classical author which is not surpassed by the labour of any scholar. The blundering of Beloe, and his occasional complete perversion of the original, did not mislead the geographer, who could detect the author's meaning even under the disguise of the translation. ('Journal of Education,' vol. i., p. 330, &c.) As a geographer, Major Rennell was one of the first Englishmen who has earned any permanent reputation; and in illustrating Herodotus and the 'Retreat of the Ten Thousand,' he occupies a place by the side of D'Anville.

RENNIE, JOHN, was born on the 7th of June 1761 at Phantassie in Haddingtonshire, Scotland, where his father was a respectable farmer. He acquired the rudiments of education at the school of the place, and afterwards received instruction in the elementary part of mathematics at Dunbar, where, on the promotion of the master, he for a short time conducted the school. It does not appear that Rennie pursued his studies far in pure mathematics, but his taste leading him to contemplate the nature and properties of machines, he probably applied himself chiefly to those parts of science which relate to elementary mechanics, and it is certain that he made himself a proficient in the useful art of drawing machinery and the different objects which belong to practical architecture. He also took advantage of such opportunities as his avocations afforded to attend the courses of lectures on mechanical philosophy and chemistry which were then given at Edinburgh by Drs. Robison and Black. Prepared thus with what books and professors could teach, he entered the world; and it may be said that during all the course of his useful life he was adding to his stock of knowledge or seeking the means of improving his practice by observing the operations and effects of his own works, as well as of those which were executed by other men.

Mr. Rennie was employed for a time as a workman by Mr. Andrew Meikle, a mechanist of his native parish, under whose superintendence he assisted in the erection of some mills in the neighbourhood; and he is said to have rebuilt, on his own account, one near Dundee. Soon after this work was finished, or about 1780, he set out for London. On his way he visited the docks at Liverpool, and spent some months at Soho near Birmingham, in examining the works of Messrs. Boulton and Watt, to whom he had brought letters of introduction from the professors at Edinburgh. Soon after he was established in the metropolis, Mr. Rennie was employed by those gentlemen in the construction of two double steam-engines and the machinery connected with them, at the Albion flour-mills near Blackfriars Bridge. All the wheel-work was made of cast-iron instead of wood, which had before been used in such machinery; and the talents of Mr. Rennie were particularly manifested in the methods which he adopted to render the movements steady. The works were finished in 1789; but they continued in operation only during two years, the whole of that great establishment having been unfortunately destroyed by fire in 1791.

Mr. Rennie continued to the last to be employed in the construction of steam-engines, or of the different kinds of machinery to which, as a motive power, steam is applied; and at the same time he was almost constantly engaged in designing or superintending those public works which have given him his claim to celebrity. Between 1799 and 1803 he constructed the elegant stone bridge at Kelso, below the junction of the Tweed and Teviot; this bridge consists of five elliptical arches, carrying a level roadway. Mr. Rennie also built stone bridges at Musselburgh and other places in Scotland; but his master-piece of this kind is the Waterloo Bridge over the Thames. This bridge, so much distinguished by its grandeur and simplicity, was begun in 1811, and finished in six years. It consists of nine equal elliptical arches

125 feet in span, and the faces of the piers are ornamented with coupled Doric columns. Besides the elegantly designed iron bridge over the Witham in Lincolnshire, he also built that which is called the Southwark Bridge, over the Thames. The latter consists of three cast-iron arches resting on stone piers, and the span of the centre arch is 240 feet.

Mr. Rennie superintended the formation of the Grand Western Canal, which extends from the mouth of the Ex to Taunton; and, in conjunction with Mr. Murray, that of the Polbrook Canal between Wade-bridge and Bodmin, in Cornwall. He also superintended the execution of the Aberdeen canal uniting the Don and the Dee, and of that between Arundel and Portsmouth. But his chief work in connection with inland navigation is the Kennet and Avon canal, which extends from Bath to Newbury, and which required all the skill of the engineer to conduct it through the rugged country between those places. He also gave a plan for draining the fens at Witham in Lincolnshire, which was executed in 1812.

The London Docks, and the East and West India Docks at Blackwall, are among the great works which were executed from his plans and under his direction. He formed the new docks at Hull (where also he constructed the first dredging-machine which was used in this country), the Prince's Dock at Liverpool, and those of Dublin, Greenock, and Leith, of which the last is remarkable for the particularly strong construction of its sea-wall. To these must be joined the insular pier or breakwater protecting Plymouth Sound from the waves which during high winds used to roll in with tremendous force. Mr. Rennie also gave plans for improving the harbours of Berwick, Newhaven, and other places, and the dockyards of Portsmouth, Plymouth, Pembroke, and Chatham: he also built the pier at Holyhead.

Before his death he had given plans for improving the docks at Sheerness; which have since been executed by his first and second sons, Messrs. George and John (now Sir John) Rennie, of whom a brief notice will be found below. It should be observed also that Mr. Rennie, sen., gave the designs for the present London Bridge; and that the charge of its construction was confided to Sir John Rennie, who, in 1831, finished that magnificent structure. Mr. Rennie married in 1789, and had six children; four sons and two daughters. He survived his wife, and, till within a few years of his death, he enjoyed excellent health. He died of an inflammation of the liver, October 16, 1821, and was buried in St. Paul's Cathedral.

The sums expended in the construction of Mr. Rennie's bridges have appeared so great as to give rise to an opinion that the measures adopted for the stability of those structures exceeded those which a due regard to economy should warrant. It is true that the Waterloo Bridge cost more than a million sterling, but several circumstances contributed to make the expense of that bridge greatly exceed that of the bridges before built over the Thames; it is, in the first place, longer, the material is granite, and the piers were built in coffer-dams. Now, granite is more costly than any other species of building-stone, both at the quarry and in the charges for working it into form; and a coffer-dam, with the engines necessary to keep out the water, is much more so than a caisson. But in a great public work durability is a primary consideration; and this is ensured by the employment of the best materials and by taking the most effectual means of securing the foundations. The extensive repairs which the bridges at Westminster and Blackfriars have required, and will continue to require, will probably, in the end, afford a full justification of the measures which have been followed in the construction of the Waterloo and the new London bridges. In the execution of machinery, Mr. Rennie may be said to have been the first who made that skilful distribution of the pressures, and gave those just proportions to the several parts, which have rendered the work of Englishmen superior to that of any other people.

\*RENNIE, GEORGE, the eldest son of the preceding, was born in Surrey on Jan. 3, 1791. He received the first rudiments of a classical and mathematical education under Dr. Greenlaw, at Isleworth in Middlesex, and afterwards under Dr. Roberts, the master of St. Paul's school, London. In 1807 he accompanied his father on a tour through England, Ireland, and Scotland, visiting the engineering works then conducted by his father, and was present at the laying of the foundation of the Bell Rock lighthouse. He was then placed at the Edinburgh University under the care of Dr. Robertson, but was afterwards removed to that of Professor Playfair, in whose house he had for a fellow-student the present Lord John Russell. He studied classics, mathematics, chemistry, and natural philosophy, under Professors Dunbar, Christison, Leslie, and Hope. In 1811 he returned to London, and commenced the study of mechanical and civil engineering under his father. His first attempt was the construction of the model of a steam engine, for which the tools were selected for him by Mr. Watt, senior. From this time he assisted his father in designing many of his great works, which he continued to do until his father's death in 1821. In 1818, on the recommendation of Mr. Watt of Aston, he had been made clerk of the irons (keeper of the money dies) and superintendent of machinery in the Royal Mint, which situation he held for several years, when he resigned it, and entered into business with his brother Sir John, as civil engineers and manufacturers of machinery. Among the works executed by them we may

mention, the continuance of most of their father's works, docks at Deptford, Woolwich, Chatham, Sheerness, Gosport, Plymouth, and Pembroke; Plymouth Breakwater; and the Royal Clarence and Royal William Victualling Establishment. In London, East and West India Docks, London Dock: Leith and Sunderland Docks. The harbours of Liverpool, Whitehaven, Port Patrick, Donaghadee, Kingstown, Holyhead, &c. The drainage of Bedford Level, Eau Brink Cut, Witham, Lynn harbour, Norfolk estuary, &c.; canals and river navigations in various parts. The bridges of London, Southwark, Staines, Hyde-park, and in various parts of England and abroad. The Messrs. Rennie were the first who surveyed and laid down many of the present lines of railways. They made the coining machinery, in conjunction with Messrs. Boulton and Watt, of the Royal Mints of Calcutta and Bombay; and of the Mints of Lisbon, Mexico, and Peru; the great Armoury of Constantinople; the biscuit, chocolate, and great flour mills of Deptford, Gosport, and Plymouth; the great dock gates of Sebastopol (ten pair in number); the block and other machinery at Nicholasief; the biscuit machinery at Sebastopol; the dredging machinery for the harbour of Odessa, the Mouth of the Danube, and Cronstadt; the great steam factory at Cronstadt; the steam factory at Astrachan on the Volga, besides many other works in Russia, France, Spain, Belgium, and the Transatlantic Colonies; the land engines of Messrs. Cubitt, four in number of forty horse power on the Woolf principle, besides many land engines in government yards. Of marine engines they have made many for the English government; the engines of the Archimedes, the first which were constructed, besides engines of large steamers of war, such as the Samson, Bulldog, &c., the Queen's yacht *Elfin*, the Reynard cruiser; and they made the engines of the celebrated *Wladimir*, and others, at Sebastopol. In the Baltic they made the first screw steam engine ever furnished for the Russian Navy, besides steam frigates, and two steam yachts, for Nicolas I. Also many large steamers, such as the Peninsular and Oriental Navigation Company's vessel *Pera* of 2620 tons and 453 horse power, and the *Candia* of 1960 tons and 454 horse power. Also many steam engines for vessels in France, Italy, the Mediterranean, and Mexico, &c. They have also built ships both of wood and iron. The Namur and Liège and the Mons and Manage railways were constructed under the direction of Mr. G. Rennie in the years 1846-49. Sir John Rennie having retired from the partnership in 1845, Mr. Rennie carried on the business alone during several years, and was then joined by his two sons, who now carry it on. Mr. Rennie was made a Fellow of the Royal Society in 1822. He is a Fellow of the Royal Irish Academy, the Academy of Turin, Rotterdam, &c. He is the Author of 'Experiments on the Strength of Materials;' on 'The Frictions of Solids;' and on 'The Frictions of Fluids,' published in the 'Philosophical Transactions.' He is also the author of articles on Hydraulics, two Papers read before the British Association, and of many papers on scientific subjects in the 'Transactions' of the Civil Engineers, such as bridges, &c.

\*SIR JOHN RENNIE, his younger brother, has borne an important part in the works above mentioned, and also constructed many on his own account. He was knighted on occasion of opening the new London Bridge. Since the dissolution of the partnership with his brother, he has practised as an architect.

\*REPP, THORLEIF GUDMUNDSSON, an Icelandic scholar of some eminence, and remarkable as being perhaps the only native of Iceland who ever held a literary post in Britain, was born on the 6th of July 1794, at Reykiadal in Arnæs-Sýssel, where his father Gudmund Bothvarson was the parish priest. After studying at the school of Bessastad (the Eton of Iceland), he went in 1814 to the University of Copenhagen, where he gained some academical prizes, and in 1821 he paid a visit to England, from which he returned in the following year. In 1825 the curators of the Advocates' Library at Edinburgh were desirous of procuring a learned foreigner for their under-librarian, and made proposals to Professor Rask [RASK] the great philologist, which he declined. "We are still anxious, however," wrote Dr. Irving, the librarian, to P. E. Müller [MÜLLER], bishop of Seland, "to procure a librarian from Denmark, and I should for my own part be disposed to prefer a young Icelfander educated at Copenhagen, and alike familiar with the languages of both countries, of three or four years' standing in the university, and completely skilled in Greek and Latin; and if he were likewise acquainted with Swedish, German, and French, he would be a still greater acquisition." He could hardly have specified more accurately the very qualifications possessed by Repp, except that in addition to the languages named the young Icelfander was acquainted with Spanish and Portuguese, and had a critical knowledge of Hebrew and Arabic. He was accordingly recommended by Rask and Müller and several other distinguished men of Copenhagen, and appointed to the office, but with the stipulation that the appointment was not necessarily a permanent one.

"The circumstance of express invitations to foreigners from large public bodies, is," says Mr. Repp in a subsequent pamphlet, "excessively rare in this country, so much so, that Mr. Repp verily believes that this is the only one that has occurred during several centuries." The experiment did not end satisfactorily to all parties. Mr. Repp contributed the article on the Advocates' Library to the 'Penny Cyclopædia' in 1833, and in it he remarked that "a collection of Spanish books containing nearly 3000 volumes was in the year 1824 bought from a London bookseller at very great expense," and that "of

the librarians, or, as they are called in Scotland, Keepers of the Advocates' Library, the two first only deserve to be mentioned as men of literary attainments, viz., Thomas Ruddiman and David Hume." The collection of the Marquis of Astorga had been purchased as containing 8000 volumes, and no keeper of a library for the time being was likely to acquiesce in such a remark respecting his distinguished predecessors. Mr. Repp's colleagues complained of infirmities in his temper; and he complained that his colleagues employed him in a way less suited to a man of acquirements than to a clerk or porter. After a contest which produced two or three pamphlets and Reports of some interest, which may be found in the library of the British Museum, Mr. Repp was informed by the curators that his future services would be dispensed with. In 1834 he was a candidate for the office of teacher of modern languages at an institution at Dollar in Fife, and printed a series of very high testimonials from Sir William Hamilton, Professor Wilson, and others; but in 1837 he returned to Denmark. He obtained permission to give public lectures on the English language and literature at Copenhagen, and has since continued in that capital, engaged in teaching English, in bringing out a dictionary, and in other literary labours.

Mr. Repp is the author of several works in Latin, Danish, and English, and edited one of the Sagas in his native Icelandic, the 'Saxdæla-Saga,' or 'History of the Inhabitants of Saxdal,' published with a Latin translation at Copenhagen, in 1826. One of the most original of his Danish works is a pamphlet entitled 'Dano-Magyariske Opdagelser' ('Dano-Hungarian Discoveries,' Copenhagen, 1843), in which he points out some resemblances which he considers to exist between Danish and Hungarian. His most important English work is his 'Historical Treatise on Trial by Jury, Wager of Law, and other co-ordinate Forensic Institutions formerly in use in Scandinavia and in Iceland,' Edinburgh, 1832-38. It treats on an interesting subject, and contains much information that might be sought for in vain in any other English book; but a smile is occasionally excited by the pertinacity with which the Icelandic author vindicates the moral and intellectual supremacy of the Icelanders, alleging that those who migrated from Norway to that island were "the most distinguished men in the former country—the flower of that stock of which less illustrious branches, emigrating to different parts of the world, became conquerors and rulers of the nations they visited, and indeed the patriarchs of modern European culture." A long preface in English by Repp, embracing a view of the Danish language and literature, is prefixed to Ferrall and Repp's 'Danish and English Dictionary' (12mo, Copenhagen), which, though on a small scale, is considered the best dictionary of the two languages extant. Erslew, in his 'Forfatter-Lexicon,' enumerates several theological works of some length, which were translated by the Icelandic librarian from German into English for the 'Edinburgh Biblical Cabinet' and similar works, and also some articles in the 'Penny Cyclopædia,' 'Encyclopædia Britannica,' and 'Blackwood's Magazine.'

REPTON, HUMPHRY, who first assumed professionally the title of 'Landscape Gardener,' was born May 2, 1752, at Bury St. Edmund's, where his father held the lucrative situation of Collector of Excise. After being placed first at the grammar-school at Bury, and then at that of Norwich, he was sent by his father, who intended to make a man of business of him, to Gorkum in Holland, in the summer of 1764. At the age of sixteen he returned to England, and was placed in a merchant's counting-house at Norwich, but all his leisure was devoted to poetry, music, and drawing. At the age of twenty-one he married, and was set up in business as a general merchant by his father, and for a while affairs prospered with him, but after a few years took an unfavourable turn, owing to losses of vessels at sea, and other circumstances in trade; wherefore having lost both his parents, he determined upon following his own inclination. He accordingly settled at Susead, near Aylsham, in Norfolk, where he passed five years occupying himself with farming experiments, gardening, and the study of rural scenery. But in 1783 his friend and neighbour Mr. Wyndham of Felbrigg being appointed secretary to the Lord-Lieutenant of Ireland, Repton agreed to accompany him as his confidential secretary. The flattering expectations thus suddenly raised were as suddenly blighted, for his patron gave up his post almost immediately, and Repton returned to Susead. There however he did not long remain, for, compelled to retrench, he took a small house at Harestreet, Essex, to which he became so much attached as ever after to reside there. Just at this time (1784) he became acquainted with Mr. Palmer, who introduced the mail-coach system, and he joined with him in his project; but though eventually the scheme prospered, Repton had to put up with pecuniary loss. He resolved to try whether he could not extricate himself from his embarrassments by gratifying his own tastes at the same time, and accordingly announced to his friends his intention of practising as a 'Landscape Gardener.' The field was open, for Brown had been dead some years [BROWN], and there was no one besides of any note. With what success this last scheme was crowned needs hardly be said, for business soon began to pour in upon him, and he was consulted by the owners of 'Places' in almost every part of the kingdom. Repton continued to enjoy uninterrupted prosperity and good health up to January 29th, 1811, when, being upset in his carriage, he received a severe injury to the spine, which rendered him a long while an invalid. He died suddenly on the 24th of March 1818.

His professional publications consist of 'Sketches and Hints on Landscape Gardening,' 4to, 1795; 'Observations on the Theory and Practice of Landscape Gardening,' 4to, 1803; 'Inquiry into the Changes of Taste in Landscape Gardening,' 8vo, 1806; 'Designs [proposed but not adopted] for the Pavilion at Brighton,' folio, 1808; and 'Fragments on the Theory, &c. of Landscape Gardening,' 4to, 1816, in which he was assisted by his eldest son. These different publications on his art were reprinted in 1840 by the late Mr. Loudon [LOUDON, J. C.], in a single octavo volume, accompanied with a memoir of the author.

RETZ, JEAN FRANÇOIS PAUL DE GONDI, CARDINAL DE, descended of a rich and powerful house, was born in October 1614. Destined by his father to the Church, in the hope of his obtaining the archbishopric of Paris, then held in succession by two members of his family, he was compelled to enter upon a profession repugnant and unsuitable to his ardent, unscrupulous, and intriguing temper. His youth was sullied by debauchery, while at the same time his theological studies were prosecuted with success and distinction; but in the history of the contests of parties in Greece and Rome he found a more congenial pursuit, and brilliant and seductive examples of what he most coveted, political ability and success. His first political connection was with the Comte de Soissons, to the success of whose revolt he looked forward for the means of abandoning his profession. Disappointed by the death of that nobleman, he resumed with more regularity his ecclesiastical studies and employments; and gained the good opinion not only of the clergy of Paris, but of Louis XIII., who, on his death-bed (1643), named Gondi coadjutor to his uncle the archbishop of Paris. He devoted himself zealously to discharge the external functions of his office; and by this regularity, and by his profuse distribution of alms, established his popularity with the citizens. The bend of his mind however is shown by his answer to one who reproached him with prodigality: "Cæsar, at my age, owed six times as much as I." His conduct made him an object of suspicion to the court; and though on the first breaking out of the disturbances of the Fronde he rendered active and valuable assistance to the royal cause, still his sincerity was not credited; and he was driven by the distrust of the court, co-operating with his own ambition, to become, not indeed the avowed leader, but the moving spirit of the popular party. "Before noon to-morrow," he said, when his resolution was formed, "I will be master of Paris;" and he kept his word. This was the eminence to which the dreams and studies of his youth had led him to aspire. "I am convinced," he said in his Memoirs, "that it requires greater qualities to be a good party leader, than to be emperor of the universe." Throughout the wars of the Fronde, a busy period of domestic contest, he maintained his ascendancy; and he has earned from one of his biographers the praise of being the only person who in those troubles sought not gain, but reputation. The praise of generosity towards his bitterest personal enemies is also due to him. The war was closed by the return of the court to Paris, in October 1652.

Tempting offers were made to induce Gondi, who had now risen to the rank of cardinal, to quit his see and repair to Rome, with the title of ambassador; but while he hesitated, and sought to make terms for his friends, he was arrested, December 19, without resistance on the part of the Parisians, who, by this time, were well wearied of civil war. For some time he was very closely confined at Vincennes. By resigning his archbishopric however, to which he had now succeeded by the death of his uncle, he purchased his removal to the chateau of Nantes, from which he effected his escape into Spain (1654), with singular boldness and good fortune. From Spain he repaired to Rome, where, in spite of the opposition of the cardinals attached to France, he supported the consideration due to his talents, and, it is said, decided the election of Pope Alexander VII. Having revoked his resignation, he maintained during some time his vicars in the administration of the archbishopric; and at last, by its surrender in exchange for other benefices, after leading for some years a wandering life, he effected his reconciliation with Louis XIV., and his restoration to France. The remainder of his life was spent chiefly in retirement, in works of charity and piety. He sold his estates, and, reserving a sum sufficient for his maintenance, devoted the bulk of his revenues to the payment of his debts, which he thus liquidated, to the great amount, as it is calculated, of more than four millions of francs, modern money. Mad. de Sévigné, who was intimate with him during his latter years, speaks with enthusiasm of the charms of his conversation, the elevation of his character, and his mild and peaceable virtues. We must conclude therefore that reflection and adverse fortune had worked a great and salutary change in his disposition. He died at Paris, August 24, 1679.

His political writings, being chiefly of the nature of pamphlets, are forgotten: as an author, his reputation rests on his Memoirs, written, Voltaire says, with an air of grandeur, an impetuosity and inequality of genius, which are the picture of his conduct. The memoirs of Joli, the cardinal's secretary, also contain copious materials for the biography of De Retz.

\*RETZSCH, MORITZ, was born at Dresden, in December 1779. Though displaying from childhood a great fondness for drawing and modelling, it was not till approaching manhood that he thought of art for a profession. He then entered the Dresden Academy, but

does not appear to have pursued a regular course of academic study. He painted portraits, and historical and poetic subjects, and in time came to be nominated (1824) professor of painting in the Dresden Academy; but as a painter he has never acquired much distinction. What first gained him a reputation beyond his native city was his series of outline etchings illustrative of the 'Faust' of Göthe, first published in 1812—a work of marvellous force and beauty, and displaying a subtlety of thought and fancy worthy of the great poem on which it was founded. These etchings immediately became extremely popular throughout Germany, and soon found equally warm admirers in England, where his works have always been highly esteemed. Enlarged editions of them have several times been produced, and they have long been the received artistic exponents, as far as they go, of the 'Faust.' Similar illustrations of Schiller's poems (1816) attained nearly equal celebrity. Then followed his 'Illustrations of Shakspeare,' of which some eight series have appeared, embracing 'Hamlet' (1828), 'Macbeth' (1833), 'Romeo and Juliet' (1836), 'King Lear' (1838), 'The Tempest' (1841), 'Othello' (1842), 'The Merry Wives of Windsor' (1844), and 'Henry IV.' (1845). As might be expected, these present a decidedly German rendering of Shakspeare's purpose, and are very unequal in effect; but they are on the whole the most intellectual series of pictorial illustrations of Shakspeare which have yet been given to the world, and often present the poet's thoughts in a new and very striking light. This is indeed what is the especial characteristic of this great original artist. He, in his own walk—as a designer in outline—might well claim to stand in the highest place; but still, far above all technical power, is to be estimated that bright, clear, and strong intelligence with which every design, and every part of each design, is irradiated. And this intelligence controls alike an almost exuberant fancy and a vigorous imagination, preserving him almost invariably from what must inevitably be the besetting danger of his turn of mind and range of subjects—exaggeration and extravagance. He deals much in allegory and symbolism, but these seldom run into mysticism, and the meaning generally reveals itself after a little attentive consideration. Besides those above named, Retzsch has published folios of wild and playful 'Phantasien,' 'Sketches,' 'Illustrations to Bürger's Leonora,' and 'The War between Light and Darkness;' also 'The Chess-Players,' and various other separate outline etchings.

Retzsch lives to enjoy in full measure the fame his right hand has won. The excellent old man dwells in a pleasant garden-house just outside Dresden, in a style of patriarchal simplicity, beloved by all who know him, and especially honoured by his fellow-citizens, among whom he has lived for now more than three-quarters of a century, and who rejoice in the credit which his genius reflects on their city; and English travellers love to relate the hearty reception he gives them, and the gratification he plainly feels in talking about England and his English friends, and showing his brimming portfolios of inexhaustible fancies, and especially the album of drawings which he presents to his wife on every recurring birthday.

REUCHLIN, JOHN, an eminent German scholar, was born in 1455 at Pforzheim, in the dominions of the Margrave of Baden. He was admitted in boyhood as a chorister of that prince's chapel, and, having gained his notice by aptitude in learning, was sent by him to Paris in 1473 as companion to his son. At Paris, Reuchlin prosecuted his studies with advantage, especially in Greek; and not to follow minutely his wandering course, we find him successively at Basel, Orleans, Poitiers, and lastly Tübingen, where, having previously taken his degree in law, he commenced practice as an advocate about 1481. In 1482 he visited Rome and other of the chief towns of Italy as secretary to the Count of Württemberg, enjoyed and profited by the society of the most learned men of the age, and was received at the court of Lorenzo de' Medici with distinguished respect. On his return to Germany he took up his abode at Stuttgart, and from 1484 to 1509 filled a variety of high legal and diplomatic functions. In the latter year he became entangled in a long and harassing dispute arising out of an edict obtained by Pfefferkorn, a converted Jew of Cologne, authorising him to examine and burn all Jewish books containing anything against the Christian religion. Reuchlin, on being referred to, gave his opinion decidedly against the justice of this measure; and in answer to a work of Pfefferkorn, entitled 'Speculum Manuale,' wrote the 'Speculum Oculare,' in 1511. This book was censured by the Cologne, Paris, Louvain, and other universities, and involved him with the Inquisition, before which in 1513 he was summoned to appear at Mainz. Reuchlin appealed to the pope; and the pope referred the matter to the Bishop of Spire, who pronounced the 'Speculum Oculare' to be neither dangerous to the Church nor favourable to Judaism. Still the universities persisted in their condemnation, and even ordered the book to be publicly burnt; and in 1516 the cause was still in course of hearing at Rome, when it was stopped by the pope, and the disputes consequent on the rise of the Reformation prevented its being revived. In the troubled times which followed, Reuchlin had his share of distress and poverty. In 1518 he accepted, and held for a short time, the Greek and Hebrew professorships at Wittenberg; and he afterwards taught Greek and Hebrew at Ingolstadt for somewhat less than a year. In 1520 or 1521 he was appointed to the same chairs at Tübingen, a pleasant gleam over the close of his troubled life; for every comfort and facility were afforded to him, and crowds of students from all parts

of Germany testified the respect in which his name and learning were held. Infirmary and sickness however soon compelled him to resign this employment, and he died at Stuttgart, June 30, 1522.

As a scholar, Reuchlin's name stands high among the men of his age. He was suspected of a leaning towards the reformed doctrines, which the liberality of his views on the Jewish question no doubt tended to confirm. Be this as it may, he never separated himself from the Roman Church. His numerous writings comprehend some elementary works on Hebrew, esteemed in their day, but of course long since obsolete; and some treatises on the cabalistic art. His fluency and purity in speaking both Greek and Latin were great, and highly admired.

REY, JEAN, a French physician, was a native of Bugue on the Dordogne. In 1630 he published at Bazas, a town about thirty miles south-east of Bordeaux, a book under the following title: '*Essays de Jean Rey, Docteur en Médecine, sur la Recherche de la Cause pour laquelle l'Etain et le Plomb augmentent de poids quand on les calcine.*' To this inquiry it appears that Rey was incited by a letter from Sieur Brun, prefixed to the work, as the cause "qui a donné sujet au présent discours." M. Brun states that on subjecting two pounds six ounces of melted tin to the air in a pot, he found that it increased six ounces in weight, and applied to Rey to explain so unexpected a fact; and he afterwards made a similar experiment with lead, and with a corresponding result.

Rey, after refuting all the different explanations of this increase of weight which had been advanced, says, in his sixteenth essay:—"Now, to augment the difficulty, I say that we must not only inquire whence these seven ounces are derived, but moreover whence that which has replaced the loss of weight necessarily arising from the enlargement of the volume of the tin by its conversion into calx, and from the vapours and exhalations that have evaporated. To this question then, resting on the foundations that I have laid, I answer, and proudly maintain, that this increase of weight comes from the air, thickened and made heavy, and in some measure rendered adhesive on the vessel, by the violent and long-continued heat of the furnace, which air mixes with the calx (its union being assisted by the continual stirring), and attaches itself to its smallest particles, no otherwise than as water when sand is thrown into it makes it heavier by moistening it and adhering to its smallest grains."

In the eleventh and subsequent volumes of the '*Royal Institution Journal*' Mr. Children has given translations of various essays of Rey, which are extremely well worth perusal by those who are curious in the history of chemical discovery. We have already mentioned that Rey's work first appeared in 1630, and it was greatly neglected till 1777, when a new edition appeared; and it is remarked by Mr. Children that the "copies of this reprint disappeared in a very sudden and remarkable manner," and the fact has led to a suspicion that it was effected by Lavoisier and his friends, to avoid the imputation of plagiarism in his celebrated work which appeared about three years afterwards. Mr. Children and Dr. Thomson however are both inclined to give full credit to the assertion made by Lavoisier that he knew nothing of Rey's essays when he originally undertook his experiments.

REYNOLDS, SIR JOSHUA, born at Plympton, July 16, 1723, of an ancient family of the county of Devon, was the son of the Rev. Samuel Reynolds, rector of Plympton St. Mary, and master of the free grammar-school there. He was originally intended for the medical profession, but he manifested when still a child so great a taste for drawing, that his father was induced to abandon his intention. Reynolds's natural inclination to the arts was much strengthened by studying the Jesuits' Perspective, but was finally confirmed, and became a passion, through the perusal of Richardson's treatise on painting, and he was from that time resolved to become a painter. He was accordingly, in 1741, in his eighteenth year, placed by his father for four years with Hudson, the principal portrait-painter of that time. Hudson's plan of instruction, that of setting his pupil to copy Guercino's drawings, had a decided influence upon Reynolds's future taste, and was probably a principal cause of the difficulty which he ever after experienced when drawing from the life. Reynolds and his master did not agree, and they separated in an unfriendly manner when half the period of the engagement had expired. Reynolds returned into Devonshire, and commenced his career as a portrait-painter, at Plymouth. He was fortunate in obtaining the patronage of Lord Mount Edgemoune, whose influence procured him introductions to distinguished naval officers of that port, amongst whom was Captain (afterwards Admiral Lord) Keppel, a connection that proved subsequently most valuable to him. His portraits exhibited at this early stage of his career decided traces of his future style. The portraits of William Gandy of Exeter, which he greatly admired for their bold and effective manner, tended not a little to confirm that taste which his previous education from Guercino was so well calculated to engender. After the death of his father, in 1746, Reynolds came to London, where he took apartments and commenced practice in St. Martin's-lane, then a favourite quarter with painters. In 1749 he accompanied Commodore Keppel as that officer's guest, in the Centurion, to the Mediterranean; and after a delay of two months at Minorca, where he resided with the governor, General Blakeney, and during which time he painted the portraits of several naval and military officers, he embarked for Leghorn, and prosecuted his journey to Rome.

BIOG. DIV. VOL. V.

Reynolds has recorded that when he first saw the grand works of Raffaele in the Vatican, he was greatly disappointed. However, he did not for a moment suppose that Raffaele owed his reputation to the ignorance or caprice of mankind: he felt his own ignorance, and stood abashed. All the undigested notions of excellence which he had brought with him from England were to be eradicated from his mind; he felt that he had originally formed a false opinion of the perfection of art; "and that if those works had really been what he expected, they would have contained beauties superficial and alluring, but by no means such as would have entitled them to the great reputation which they have so long and so justly obtained." Yet the works of Raffaele had little, if any, permanent influence in forming his style, which belonged to a wholly different school.

Reynolds never made a practice of copying pictures or taking sketches of whole compositions, as is the habit with many young painters. He very properly considered copying a "delusive kind of industry;" yet he was in the habit of selecting parts of compositions which were of striking excellence, or from an attentive study of which he imagined he should derive substantial benefit. It was in studying the various great works in the Vatican, particularly those of Michel Angelo and Raffaele, that he contracted a severe cold which caused a deafness for the remainder of his life. From Rome he went to Florence, Bologna, Parma, Modena, Milan, Padua, and Venice, where he lodged with Zuccarelli, the landscape painter. The great masters of Venice, Titian, Paul Veronese, and Tintoretto, had a far greater influence upon Reynolds's future practice than the great works in Rome. The rich effect of Venetian tone and colour were much more suited to his genius or taste, which decidedly inclined to the florid or ornamental; and however much his better judgment may have induced him to extol the grandeur of the Roman school in his '*Discourses*,' it was the magnificence of the Venetian that captivated him, that guided his practice, that excited his emulation. From Venice he went through Turin to Paris, where he made a short stay, and returned to Plymouth towards the end of the year 1752, after an absence from England of three years and a half. At Plymouth he painted two portraits, one of which was of the Rev. Zachary Mudge, vicar of St. Andrews, and the old friend of his father.

By the advice of his early patron, Lord Mount Edgemoune, Reynolds returned to London, and again took apartments for a short time in St. Martin's-lane, where he painted his celebrated portrait of Joseph Marchi, in a Turkish dress, a young Italian whom he had brought with him as an assistant from Rome, a work which attracted much attention and brought him numerous sitters.

Reynolds's practice as a portrait-painter becoming very considerable, he took a house in Great Newport-street, where he continued some years. One of his first works of value was a portrait of the then Duke of Devonshire, but that which established his fame as the first portrait-painter of his country was a full-length of his friend Commodore Keppel standing upon the sea-shore. It was about this time that he contracted an intimacy with Dr. Johnson, which only ended with the death of the latter. When Reynolds painted in St. Martin's-lane, his prices were for a head 10 guineas, a half-length 20 guineas, and for a whole length 40 guineas; in Newport-street they were at first respectively 12, 24, and 48 guineas, but his practice increased so rapidly that in 1758 he raised his price to 20 guineas for a head, and in 1760 to 25 guineas, the other sizes being in proportion.

At this period he was in the habit of receiving six sitters a day, and he valued his time at five guineas an hour. In 1761 he purchased a house in Leicester-square, where he fitted up an elegant painting-room, and built a spacious gallery for his rapidly-increasing collection of works of art; and here he resided the remainder of his life. His practice had now become so great, that he employed several assistants, of whom Marchi, the Italian, and Peter Toms, the celebrated painter of draperies, were the principal. This year the first public exhibition of works of art took place, in the room of the Society of Arts, in which Reynolds had four pictures, and in the exhibition of the following year, in Spring-gardens, he exhibited his portrait of Lord Ligonier on horseback (now in the National Gallery), and one of Sterne. The pictures, though not to be compared with his later performances, from a peculiarity of style and a richness of effect which distinguished them from the works of other artists, attracted universal attention, and established Reynolds as the favourite of the public. In 1762 he painted his celebrated picture of Garrick between Tragedy and Comedy; it was bought by the Earl of Halifax for three hundred guineas, and has been engraved by Fisher. Dr. Johnson, in a letter written this year to Baretti, says, "Mr. Reynolds gets six thousand a year." In 1764 Reynolds and Johnson instituted the Literary Club, which was then limited to twelve members: Goldsmith and Burke were of the number.

Upon the foundation of the Royal Academy, in 1768, Reynolds was unanimously chosen president, and the honour of knighthood was conferred on him upon the occasion. The Academy was opened on the 1st of January 1769, and the president delivered an appropriate discourse in commemoration of the event. Lecturing was no part of the duty of the president; it was a task which Sir Joshua imposed upon himself. He delivered altogether fifteen of these discourses, which have been translated into several languages, and have been generally and deservedly well received: they are too well known to

require any particular comment here. They are certainly in many respects admirable; yet with much sound and original criticism, they contain much also that is questionable.

In 1770 Sir Joshua raised his price for a head to thirty-five guineas. In 1773 he painted his celebrated picture of Count Ugolino with his Sons, from Dante: it was purchased by the Duke of Dorset for four hundred guineas, and has been engraved by Dixon. This same year he proposed his plan of decorating St. Paul's Cathedral with a series of historical pictures, which was readily acceded to by Dr. Newton, bishop of Bristol and dean of St. Paul's; but Dr. Terrick, bishop of London, put a stop to the whole scheme, upon the plea that it was an introduction of popery: the other artists who had agreed to contribute works were West, Barry, Dance, Cipriani, and Angelica Kauffmann. This year is also memorable for two honorary distinctions which were conferred upon Sir Joshua; he was created Doctor of Civil Law by the University of Oxford; and was elected mayor of his native town, Plympton, a circumstance which gave him great gratification, and he presented the corporation with his portrait upon the occasion, which portrait however the corporation sold a few years back. About this time also he was elected member of the Imperial Academy of Florence, to which body he also sent his portrait. In 1779 he ornamented the ceiling of the library of the Royal Academy, in its apartments in Somerset House, with an allegorical painting representing Theory seated on a cloud, with the inscription "Theory is the knowledge of what is truly Nature," written upon a scroll in her hand. In this year he raised his price to fifty guineas for a head, which continued to be his charge during the remainder of his life.

In 1780 and the following years, Sir Joshua was engaged upon his designs for the celebrated window of New College Chapel, Oxford, consisting of seven compartments for the lower range, containing the allegorical figures of the four cardinal and the three Christian virtues, Temperance, Fortitude, Justice, Prudence, Faith, Hope, and Charity; and above them 'The Nativity,' lighted after the manner of the famous 'Notte' of Correggio. These designs were executed on the glass by Jervis of Dublin. The original design for the Nativity was purchased by the duke of Rutland for twelve hundred guineas, and was destroyed by the fire at Belvoir Castle in 1816; there is an engraving of it by Earlom.

In 1784 Sir Joshua painted his magnificent allegorical portrait of Mrs. Siddons as the Tragic Muse, a picture of its class perhaps unrivalled. According to Northcote, Sir Joshua valued this portrait at a thousand guineas; but it was purchased by W. Smith, Esq., for seven hundred: it has been engraved by Hayward. Upon the death of Allan Ramsay, this year, Sir Joshua was appointed principal painter in ordinary to the king. This year he also lost his old friend Dr. Johnson, who appointed him one of his executors, and bequeathed him his great French dictionary of Moreri and his own corrected folio copy of his English dictionary.

In 1786 he painted his 'Infant Hercules strangling the Serpents in the Cradle,' for the Empress Catherine of Russia: it was sent to St. Petersburg, with two sets of Sir Joshua's Discourses, one in French, the other in English, in 1789; and the following year, the Russian ambassador, Count Woronzow, presented him with a gold box, having the portrait of the empress upon the lid, set with large diamonds. His executors afterwards received fifteen hundred guineas as the price of the picture. This picture, which was remarkable for its rich effect of colour and forcible chiaroscuro, was the principal of Sir Joshua's historical pieces, and met with universal applause from the critics of the day. Even the eccentric Barry approved of it: he said "the prophetic agitation of Tiresias, and Juno enveloped with clouds, hanging over the scene like a black pestilence, can never be too much admired, and are indeed truly sublime." The leading features of the composition were apparently taken from the 'Iconic' of the younger Philostratus on the subject: it has been engraved in mezzotint by Hodges.

Sir Joshua painted three pictures for Alderman Boydell's Shakspeare, the Cauldron Scene in 'Macbeth,' Puck in 'A Midsummer Night's Dream,' and the 'Death of Cardinal Beaufort.' For the first of these pieces the alderman paid Sir Joshua one thousand guineas, for the second one hundred, and for the third five hundred guineas.

Towards the end of 1791, a tumour, accompanied with inflammation, formed over his left eye; and being apprehensive lest the right should also be affected, he felt it necessary to desist from any further practice in his profession. He accordingly sent a letter to the council of the Academy, intimating his intention of resigning the office of president, on account of bodily infirmities; but he was induced to retain it upon the appointment of West as a deputy. He never again however resumed the chair; but died a few months afterwards, after a painful illness, of a disease of the liver, February 23rd, 1792, in the sixty-ninth year of his age; and on his body being opened by Hunter, his liver was found to be more than double its natural size. The body of Sir Joshua Reynolds, after lying in state in Somerset House, was buried with great pomp in St. Paul's Cathedral, where some years after, a statue, executed by Flaxman, was erected to his memory.

The principal portion of his property, which amounted upon the whole to 80,000*l.*, he bequeathed to his niece, Miss Palmer, who shortly afterwards was married to the Earl of Inchiquin, subsequently created Marquis of Thomond. His collection of works of art sold for

about 17,000*l.*, including several of his own works, and many unfinished and unclaimed portraits.

When we consider Sir Joshua's expensive habits and his liberal disposition, this large property enables us to form some idea of the immense patronage that he enjoyed. Upon the whole, his career from the beginning to the end exhibits an example of uninterrupted and brilliant prosperity that has perhaps never been surpassed. There are engravings from upwards of seven hundred of his works, mostly in mezzotint. Northcote has given a list of about three hundred of his principal performances. The day after Sir Joshua's death a brilliant eulogium from the pen of Burke, who was one of his executors, appeared in the papers.

"As to his person," says Northcote, "in his stature Sir Joshua Reynolds was rather under the middle size, of a florid complexion, roundish blunt features, and a lively aspect; not corpulent, though somewhat inclined to it, but extremely active; with manners uncommonly polished and agreeable. In conversation his manner was perfectly natural, simple, and unassuming." He was never married.

Sir Joshua Reynolds's literary productions, besides his discourses, were three contributions to the 'Idler,' some notes to Mason's translation of Du Fresnoy's 'Art of Painting,' a few notes for Dr. Johnson's edition of Shakspeare; and his remarks upon the works of the Dutch and Flemish painters during his tour through Flanders and Holland in 1781. These last are full of admirable criticism, and display a rare discrimination of merits and demerits according to the intents and means of the various painters. It was during this tour that he first learnt to appreciate the wonderful powers of Rubens; he says of him, "he was perhaps the greatest master in the mechanical part of the art, the best workman with his tools that ever exercised a pencil." Several complete editions of his works have been published.

Reynolds has been justly said to be the founder of the British school of painting. Through a happy combination, and a judicious and powerful application of qualities, whether originating in natural feeling or acquired by selection from other masters, he struck out a new path in portrait, and by uniting graceful composition and breadth of light and shade with a rich and mellow tone of colouring, he invented a style of his own. This was a style, through its novelty and richness of effect, well calculated to captivate the taste of a public accustomed to the dry and feeble manner of the painters immediately preceding him, whether a Hudson, a Jervas, or a Kneller. But these attractive qualities, being the chief aim of the painter, naturally involved the sacrifice of some of those more solid properties of art through which alone true expression and individual character can be thoroughly attained, which we find more or less so well illustrated in the heads of Holbein, Raffaele, and Vandyck, and which must always be imperfectly given when the features, though admirably placed, are merely indicated, however rich the colour, and however great the effect. The deficiencies of Sir Joshua's style are more striking in his historical pieces than in his portraits. Its great characteristic, *effect*, and effect founded upon colour, is incompatible with the qualities peculiarly characteristic of the grand style—simplicity, severity, and dignity of expression, which can only result from the union of a grand style of design with a subdued colour.

RHAM, WILLIAM LEWIS, was born at Utrecht, in the Netherlands, in 1778; and of this country his father was, we believe, a native, but his mother was of Swiss birth. Mr. Rham came to England in early life. He studied for some time at Edinburgh, with a view to the medical profession; but eventually the Church became his destination, and he entered at Trinity College, Cambridge. In 1806, being then in his twenty-eighth year, he took his degree, and his name appears on the Tripos as tenth wrangler. In 1808 Mr. Rham was presented by the dean and chapter of Salisbury to the living of Winkfield, Berkshire; and a few years afterwards the Nassau family presented him to that of Fersfield in Norfolk. He died unmarried at Winkfield, after a short illness, on the 31st of October 1843.

The life of Mr. Rham was characterised by active and unremitting usefulness as a parochial clergyman. He was the friend of the poor in the best sense of the term. He looked beyond the wants of the moment, and sought the means to improve and elevate as well as temporarily to benefit the objects of his benevolence. At the Winkfield School of Industry, which under his fostering care became a model for all similar institutions in country parishes, the young were taught not only the elements of knowledge, but were instructed in agriculture and useful arts, and trained to habits of industry. Such were the means by which he endeavoured to promote the best interests of his parishioners.

But it is as a scientific agriculturist that Mr. Rham's name is most widely known; and during a large part of his life it was perhaps better known in other countries than in England. His early connection with the Continent, which was kept up in after-life, afforded scope for observation of the husbandry of different countries; and his thorough knowledge of several living languages gave him access to the works of scientific writers on foreign agriculture. In the next place, his chemical studies at Edinburgh, while preparing for the medical profession, were of eminent service to him; and scarcely less so was the proficiency in mathematics which he attained at Cambridge. It may safely be asserted that no previous writer on agriculture ever enjoyed in so great a degree such a combination of advantages; and

to his knowledge of the chemical and mechanical departments of agriculture there was united a thorough acquaintance with its routine details. On his farm at Winkfield he engaged in his favourite pursuit with a practical perception of its details, and a scientific knowledge of its processes, which had probably never before been possessed by one person. Thus, above all other writers of his day on the subject of agriculture, Mr. Rham was eminently fitted by his excellent judgment and sound sense, to be useful to the country in the existing state of its husbandry and rural economy. He was an active member of the council and upon the committees of the Royal Society of Agriculture from its formation in 1838. Mr. Rham wrote the chief agricultural articles, including those on the agriculture of the several counties, in the 'Penny Cyclopædia;' and from these, those on the principal subjects of interest to the agriculturist were collected in a volume entitled 'The Dictionary of the Farm.' He wrote the last article of this series ('Yorkshire Agriculture') in 1843, only a few weeks before his death. He was also the author of 'Flemish Husbandry,' a small work written for the 'Farmers' Series of the Library of Useful Knowledge.' This work was founded on a pedestrian tour in Flanders, in which, for many weeks, he walked from farm to farm, enjoying the rough hospitality of an industrious population, speaking their language readily, and entering into their pursuits with the zeal of a skilful and sympathising friend. The 'Essay on the Analysis of Soils,' for which he obtained the prize offered by the Royal Society of Agriculture, is published in the society's 'Journal,' which also contains some other valuable contributions from his pen. Not long before his death he had also commenced a series of papers on agriculture and rural economy in the 'Gardeners' Chronicle,' edited by Dr. Lindley.

RHAZES, or RAZES, the common Latinised name of one of the most famous of the ancient Arabic physicians, who is also sometimes called RASÆUS, RASES, RASIS, RAZEUS, RAZEUS, RAZI, RHASES, RHAZEUS, RHAZIS, or ARRABIS. His names (as given by the anonymous author of the 'Arabic Philosph. Biblioth.,' quoted by Casiri, 'Biblioth. Arabico-Hisp. Escur.,' tom. i., p. 264) were Mohammed Ben-Zakaria Abu-Bekr Al-Razi. He was born and brought up at Rai, the most northern town (according to D'Herbelot, 'Biblioth. Orient.') of Irak Ajemi, and showed from his youth a great inclination for the sciences. He acquired great philological and philosophical knowledge, but chiefly devoted himself to music; and even in his thirtieth year he was only known for his skill in singing and playing on the guitar. He afterwards, when past the age of forty (Abulfeda, 'Annal. Musl.,' tom. ii., p. 347) applied himself exclusively to the study of medicine and philosophy, and repaired to Baghdad, where Ibn Zein Al-Taberi was his instructor, from whom he acquired much important information. Upon his return to Rai he became director of the hospital in that town, and afterwards of that at Baghdad. He was held in great estimation by the contemporary princes, and was called the Galen of his time. He travelled much, and visited both Jerusalem and Africa: he is said also to have visited Spain ('Leo Afric.,' 'De Viris Illustr. Arab.,' cap. 6; apud Fabric, 'Biblioth. Græc.,' tom. xiii.), where, in passing through the streets of Cordova, he saw a crowd collected round the body of a man who was said to have just fallen down dead. He caused him to be beaten all over with rods, and particularly on the soles of his feet, and thus in less than a quarter of an hour restored him to life. Upon being asked about the invention of this singular remedy, he said that he had seen it used with success in a similar case by an old Arab; and added, that "experience is of more use than a physician." To Prince Al-Mansour, to whom he dedicated his work entitled 'Ketâb Almansûrî' ('Liber ad Almansorem'), he wished also to present his 'Confirmatio Artis Chinie,' and left Baghdad for this purpose. The prince was much pleased, and gave him a thousand dinars; but wished at the same time to see a trial of the discoveries described in the book, and granted a considerable sum for the preparation of the necessary apparatus. The experiments however did not succeed, which so enraged Al-Mansour that he called him a liar, struck him a violent blow on the head, and ordered him to pack up his things quickly and go back to Baghdad. (Ibn Khallikân, 'Vite Illustr. Viror.') This blow is said to have afterwards occasioned his becoming blind, but Abulfaraj ('Hist. Dynast.,' p. 291) and Casiri (*loc. cit.*) attribute this misfortune to eating beans. At first he wished to have an operation performed; but as the surgeon could not tell him how many membranes the eye contained, he refused to let him touch his eyes; and when some one represented to him that the operation might nevertheless succeed, he replied, "I have seen so much of the world that I am wearied of it." He was so charitable and liberal that he often gave money to his poor patients, and lived himself in poverty. He died at an advanced age, either at Baghdad or Rai, A.H. 311, or more probably 320 (A.D. 923 or 932), under the kalifat of Moctader Billah, the eighteenth of the race of the Abbasides. (Wüstenfeld, 'Gesch. der Arab. Aerzte.')

His works amounted to more than two hundred, and the bare titles, as given by the anonymous author quoted above, take up four folio columns in Casiri; of these only those that have been published can be noticed here; and for a more complete account of his medical opinions and practice, the reader may consult Freind's 'Hist. of Physic,' Sprengel's 'Hist. de la Méd.,' and Haller's 'Biblioth. Medic. Pract.' The principal work of his that we possess is called 'Al-Hâwî' ('Continens'). An attentive perusal of this book is sufficient to prove

that Rhazes could not have published it in its present form, as the diseases are mentioned without the least order; the treatment of many of them is not touched upon; the author is sometimes quoted in the third person ('Rhaz. Contin.,' lib. vi., cap. 1, page 125, col. 2; lib. viii., cap. 2, page 176, col. 4); and lastly, one meets with the names of several Greek physicians more modern than Rhazes. To all these arguments against the authenticity of the work may be added the important testimonies of Haly-Abbas and Abulfaraj. The former gives Rhazes all the praise he really deserves; but adds that the 'Al-Hâwî' is certainly not the most evident proof of his science and good taste, but that probably he only left the work to his descendants in the form of an unfinished sketch. (Haly-Abbas, 'Prolog.,' 4to, page 6, ed. Lugd., 1523.) Abulfaraj says positively that the authentic 'Al-Hâwî' was never published. ('Chron. Syr.,' page 172, ed. Bruns et Kirsch.) Notwithstanding these unanswerable proofs against the authenticity of the work, it cannot be doubted that great part of it was written by Rhazes; and it will always be considered one of the most valuable repositories of the medical science of the Arabians. (Sprengel, 'Hist. de la Méd.') The original Arabic has never appeared; but several Latin translations (under the various titles 'Elhavi,' 'Helchaui,' 'Elchavi,' 'Elkavi,' 'Hawi,' &c.) were published in the 15th and 16th centuries. The first edition is scarce, and was printed at Brescia (Brixia), 2 vols. fol., 1486, in black-letter, with two columns in a page, under the following title: 'Liber Elhavi, seu Totum Continentis Bubikir Zacharie Errasis Fili, traducti ex Arab. in Latin. per Mag. Ferragium, Medicum Salerni, &c.' The last edition is probably that by Hieron. Surianus, fol., Venet., 1542.

The most celebrated of his works is his treatise on the small-pox and measles, which is the oldest account that we possess of these two diseases. "He was not however the first writer on the subject, for he himself quotes from Aaron and other of his countrymen, who had formerly given imperfect histories of these diseases." Of this little work there is an edition in Arabic and Latin, by J. Channing, Lond., 8vo, 1766. It was printed from a manuscript at Leyden, and Dr. Russell says (Append. to 'Nat. Hist. of Aleppo') that he had the book collated with other manuscripts in the East, and that the readings were upon the whole found very exact. It has been translated into several ancient and modern languages. There is an English translation in the English edition of Dr. Mead's medical works.

The ten books, dedicated to Al-Mansour, 'Ketâb Almansûrî,' 'Liber ad Almansorem,' contain a complete system of medicine, drawn from Arabic and Greek sources. The first book is on anatomy and physiology; the second, 'De Significationibus Temperamentorum,' the third, 'De Alimentis et Simplicibus,' the fourth, 'De Sanitatis Tuendæ Ratione,' the fifth, 'De Morbis Cutis, et de Cosmeticis,' the sixth, 'De Victu Peregrinantium,' the seventh, 'De Chirurgia,' the eighth, 'De Venenis,' the ninth, 'De Curatione Omnium Partium,' and the tenth, 'De Febris.' The writers from whom the work is chiefly compiled are Hippocrates, Galen, Oribasius, Paulus Ægineta, and Aëtius. It contains an excellent treatise on the qualities necessary for a physician (Tract iv., cap. 32, pag. 78, ed. Lugd., 8vo, 1511). There is also a very curious chapter (Tract vii., cap. 27, pag. 123) on quacks and impostors, which has been translated and inserted by Freind, in his 'History of Physic.' He is said by Jo. Bapt. Silvaticus ('Controv. Med.,' sec. 14) to be the first person who recommended intoxication once or twice a month ('Almans. Tract.,' iv., cap. 5, pag. 64), which precept was repeated by Avicenna ('Cantic.,' part ii., sec. 34, pag. 383, ed. Venet., 1564), and others, and vigorously opposed at Paris in the 17th century, in two theses, by Hommets and Langlois. The ninth book was for several centuries one of the most celebrated text-books for medical students, but, notwithstanding its fame, Sprengel and Haller both declare that it contains nothing original. The Al-Mansour to whom the work is dedicated has by some been supposed to be the kalif of Baghdad, who lived above two centuries before the time of Rhazes, by others a prince of Cordova, who lived long after. Rhazes himself solves the difficulty, and says ('Antidotar. Prolog.,' pag. 78, b. ed. Venet., 1500) that he was a prince of Khorassân ('domino Corascem'), and nephew of the kalif Moktasi, named Al Mansûr Ibn Ishac Ibn Israel Ibn Ahmed. The whole of the Arabic original of this work has never been published, but a small extract (lib. ix., cap. 7) is inserted, with a Latin translation, in Reiske's 'Opusc. Med. ex Monument. Arab.,' p. 70, sq. The first Latin translation was published with several other of his smaller works, Medioli, folio, 1481, in black-letter; the last edition came out at Basel, folio, 1544. There are also several other works that have been published with the 'Liber ad Almansorem,' for example, 'Liber Divisionum,' 'Aphorismi,' 'De Juncturis,' 'Antidotarium,' 'De Morbis Infantum,' 'Introductio in Medicinam,' 'De Calculo Renum et Vesicæ,' 'De Facultatibus Partium Animalium,' &c. None of these little works contain anything of much importance.

RHENANUS, BEATUS, was born in 1485, at Schlettstadt in Alsace. His father, though originally a butcher of Rheinach (whence the name Rhenanus), was a man of considerable property, and gave his son the best education that could be had in those times. After the boy had finished his elementary education, his father sent him to Paris, where he studied philosophy and ancient literature. From Paris he went to Strasbourg and Basel, and in the latter place he formed an intimate friendship with Erasmus and Gelenius. During his residence

at Paris he had been employed in the office of the learned printer H. Stephens, and he occupied himself in a similar manner in the printing establishment of Froben at Basel. In 1520 his father died, and left him all his property; but although Rhenanus retired to Schlettstadt, he continued his favourite study of the ancients with the same zeal; and in order not to be disturbed, he requested and obtained from the Emperor Charles V. an exemption from all public offices. He had always objected to marrying, but at last his friends prevailed upon him, and at the advanced age of sixty-one he married. A few months afterwards he was attacked by a disease, from which he sought relief in the baths of Baden, but as they only increased his sufferings, he returned home, and on his way thither he died, at Strasbourg, on the 20th of May 1547. His body was carried to his native place, and buried there.

Rhenanus is chiefly celebrated as the editor of many ancient authors, on whom he bestowed great care, with the view of giving a correct text. The following is a chronological list of most of his editions:—‘Quintus Curtius,’ Basel, 1517; ‘Maximus Tyrius,’ Basel, 1519; ‘Velleius Paterculus,’ Basel, 1520 (this is the editio princeps of that historian); ‘Tertulliani Opera,’ Basel, 1521; ‘Auctores Historie Ecclesiastice,’ containing Eusebius, Pamphilus, Nicephorus, Theodoret, &c., 1523-25 (reprinted at Paris in 1541); ‘Plinius, Historia Naturalis,’ Basel, 1526; ‘Procopius Cæsariensis, De Rebus Gothorum,’ Basel, 1531; ‘Tacitus,’ Basel, 1533; reprinted in 1544; ‘Livii Decades Tres,’ Basel, 1535.

Among the original works of Rhenanus we may mention—‘Præfatio in Marsilii Defensionem Pacis pro Ludovico IV. Imperatore, adversus iniquas Ecclesiasticorum Usurpationes,’ Basel, 1522. This work was published under the assumed name of Licentius Euangelus, sacerdos. ‘Illyrici provinciarum utriusque Imperii cum Romano tum Constantinopolitano servitibus Descriptio,’ published at Paris in 1602, together with the ‘Notitia dignitatum imperii Romani.’ ‘Rerum Germanicarum,’ libri iii, Basel, 1531: this work has often been reprinted. The edition of Sturm (Basel, 1551) contains a good Life of Rhenanus. He also translated several works from the Greek into Latin, such as some works of S. Gregorius Nazianzenus, part of the writings of Origines, in the edition of Erasmus, &c.

**RHETICUS.** The real name of this individual was George Joachim. He was born February 16, 1514, at Feldkirch, a small town situated a few miles south of Lake Constance, and was surnamed Rheticus from the circumstance of this part of the Tyrol having been anciently inhabited by the Rheti. When twenty-three years old he was appointed professor of elementary mathematics in the university of Wittenberg, the higher chair being at that time filled by Reinhold; but after teaching there with some repute for about two years, he relinquished his appointment in order to become the disciple and assistant of Copernicus, whose doctrines he advocated with much zeal and personal risk. His letter to Schöner, entitled ‘Narratio de Libris Revolutionum Copernici,’ wherein he endeavoured to show that the rotation of the earth about the sun is not a mere probable hypothesis, as Copernicus had thought fit to announce it, but an incontestable truth, and asserts that if Aristotle himself were living, he would be the first to acknowledge his error, excited against him the ill-will of the leading advocates of the Ptolemaic system. This letter appeared in 1540, Danzig, 4to; was reprinted the following year at Basel, and appended to the work of Copernicus, ‘De Revolutionibus,’ Basel, 1566; and to Kepler’s ‘Prodromus Dissertat.’ Tübing., 1596. He resumed his professorship in 1541-42; and in the latter year were published his ‘Orationes de Astronomia, Geographia, et Physica,’ Nürnberg. He subsequently visited different parts of Germany, taught for some time at Leipzig, and died of apoplexy at Cashau, in the north of Hungary, the 4th of December 1576. (Zedler.)

Rheticus has left an indisputable proof of extraordinary industry and devotedness to science in a posthumous work, entitled ‘Opus Palatinum de Triangulis à Georgio-Joachimo-Rhetico coeptum, L. Valentinus Otho, principis palatini Frederici IV., electoris mathematicus consummavit, Neostadii in Palatinatu,’ folio, 1596. The least important part of this work is the introductory treatise on Trigonometry, in nine books, of which the first four, relating to right-angled triangles, were written by Rheticus, and the other five, on oblique triangles, by his pupil Otho. They comprise four hundred and eighty-one folio pages, which, observes Delambre, might be compressed into ten.

As authors, Delambre declares that Rheticus and Otho were the most prolix and obscure that he had ever met with. After the introductory treatise follows a table of sines, cosines, tangents, cotangents, secants, and cosecants, to every ten seconds of the quadrant, and to a radius of 10,000,000,000. Nearly the whole of this extensive table, which must have been of inestimable value to the astronomer, was the work of Rheticus, though the contrary might be inferred from the statements of Montucla and Lalande. The sines were originally computed by him to fifteen places of figures, and were correct to the fourteenth, as was shown by M. Prony, in the fifth volume of the ‘Mémoires de l’Institut;’ but only the first ten were inserted in the ‘Opus Palatinum.’ The table of tangents and secants was not quite complete when Rheticus died. Those which were wanting were added by Otho. The whole were computed to ten places of figures, of which only the first eight could be relied on. Pitiscus subsequently computed the tangents and secants as far as eleven

places of figures (Montucla says sixteen), which, with the rest of the table of Rheticus, he published in 1613, under the title of ‘Thesaurus Mathematicus.’

It is to the labours of Pitiscus that Montucla ascribes most praise, designating them “the most remarkable monument of human patience, the more meritorious as it was accompanied by so little glory,” which observes Delambre, would be true if the name of Rheticus were substituted for that of Pitiscus, whom he considers to have been little more than the editor of the ‘Thesaurus Mathematicus.’ (See the ‘Astronomie Moderne,’ ii., p. 34.) The only terms employed in the ‘Opus Palatinum’ to express the several functions of an arc, are base, perpendicular, and hypothenuse; the terms tangent and secant had not then been introduced, and the appellation sine, which had been generally employed by Müller and others, was rejected by Rheticus. The construction of the canon is understood to have commenced in the year 1540.

Rheticus had intended to publish two treatises in German on astronomy and philosophy generally, and had announced a work on chemistry, in seven books, none of which have appeared. In these his chief aim was to abolish hypothesis, and to rest exclusively on observation.

(Zedler, *Grosses Universal Lexicon*, xiv. 812; Küstner, *Geschichte der Mathematik*, i. 561-62; Delambre, *Astron. Mod.*, ii. 1-25; Weiss, *Biog. Univ.*, art. ‘Joachim;’ see also Adani, *Vit. Philos. Germ.*; and Vossius, *De Mathem.*)

**RHIANUS**, a Greek poet, was a native of Bena in Crete, and lived about the time of Eratosthenes. He was originally a slave who had a kind of superintendence over a palestra, but he subsequently became a learned grammarian, and wrote several poems: one of them was a *ῥηάκλεια*, consisting of four books. Another of his poems, called *Μεσσηνιακά*, contained a poetical description of the second Messenian war, of which we probably possess the substance in the account given by Pausanias in his fourth book. Other poems of Rhianus were the *Θεσσαλικά*, *Ἀχαιικά*, and *Ἡλιακά*. Athenæus (xi. p. 499) also mentions epigrams of Rhianus. The Emperor Tiberius is said to have been very fond of the poems of Rhianus, and even to have imitated them. (Sueton., ‘Tiber.’, c. 70.) The few extant fragments of his works are collected in Brunck’s ‘*Analecta*,’ in Jacob’s ‘*Anthologia Græca*,’ in Gaisford’s ‘*Poet. Græci Minor*,’ and separately in a little book by N. Saal, under the title ‘*Rhiani quæ supersunt*,’ Bonn, 1831. Compare A. Meineke’s essay, ‘*Ueber den Dichter Rhianos*,’ in the ‘*Transactions of the Berlin Academy*,’ 1834, and his ‘*Analecta Alexandria*,’ Berlin, 1843.

**RHIZOS RHANGAVIS.** [RIZO RANGABÉ.]

**RHODOMANNUS, LAURENTIUS**, was born in 1546, at Sassa-werf, on the estates of the counts of Stolberg. His parents were poor, and as the boy early displayed great talents, Count Stolberg sent him at his own expense to the gymnasium at Ilfeld. Greek literature, which was then reviving in Germany, had most attractions for him, and he made it his principal study at the University of Rostock. After the completion of his studies, he held several offices as teacher, but was afterwards invited to the professorship of Greek literature in the University of Jena, and subsequently to that of history at Wittemberg, where he died on the 8th of January 1606.

Rhodomannus is said to have been extremely ugly, but his learning and amiable qualities soon effaced the unfavourable impression created by his appearance. His greatest merits consist in his efforts to diffuse a taste for Greek poetry, and he endeavoured to attain this object by making Greek verses himself, in which he is said to have been very successful. We still possess a number of works by Rhodomannus, in Greek verse with Latin translations, viz.: ‘*Vita Lutheri, Græco carmine descripta et Latine reddita*,’ Ursel, 1579; ‘*Descriptio historiarum ecclesiæ, &c., Græco carmine cum versione Latina, e regione textus Græci*,’ Frankfurt, 1581; ‘*Poesis Christiana, id est, Palestina, seu Historiæ Sacre, Græco-Latine, libri ix.*,’ Marburg, 1589; ‘*Theologiæ Christianæ Tyrocinia, carmine heroico Græco-Latino, libri v.*,’ Lipsiæ, 1597, &c. Rhodomannus also made some Latin translations of Greek authors, as of Diodorus Siculus, which is printed in the edition of H. Stephens (1604); of the ‘*Posthomerica*’ of Quintus Calaber; he also made a translation of extracts from ‘*Photii Bibliotheca*’ and Diodorus Siculus, under the title of ‘*Memnonis Historia de Republica Heraclensium et Rebus Ponticis Eclogæ*,’ Helmstadii, 1591, and reprinted at Geneva in 1593. Rhodomannus edited the following collection of Greek poems:—‘*Anonymi Poetæ Græci: Argonautica, Thebaica, Troica, Ilias parva, Arion, Narratio de Bello Trojano e Constantini Manassis Annal.*,’ &c., Lipsiæ, 1588. His Life has been written in Latin, by Ch. H. Lang, Lübeck, 1741.

**RIBALTA, FRANCISCO**, a distinguished Spanish painter of the school of Valencia, was born at Castellon de la Plana in 1551. When very young he fell in love with his master’s daughter, but the father (his name is not mentioned) would not consent to a marriage, on the plea that Ribalta was not sufficiently advanced in his profession. Upon this he determined to go to Rome, and his mistress plighted her faith to him. At Rome he studied the works of Raffaele, and particularly of Sebastian del Piombo. Upon his return to Valencia after an absence of three or four years his professional improvement at once procured him the hand of his mistress. Ribalta soon obtained great reputation. His first public work was the Last Supper, ordered

by Archbishop Don Juan de Ribera for the grand altar of the College of Corpus Christi, at Valencia. He painted the portrait of a venerable friar of the place, Pedro Muñoz, as St. Andrew; and as Judas, a shoemaker of the name of Pradas, whose vicinity was a nuisance to him. He died in 1628, and was buried in the church of San Juan del Mercado, in Valencia.

Ribalta's design was correct and vigorous; he was a good anatomist; and his compositions are often grand. In colouring also he was generally good, much resembling Sebastiano and Titian, though occasionally dry; but the works of some of his principal scholars, as Castañeda and Bausa, are sometimes attributed to him. His works are or were very numerous in Valencia, and there are several at Castellon de la Plana, and Madrid; and some at San Ildefonso, Toledo, Zaragoza, Andilla, Algemesi, Torrente, Portaceli, Morella, and Carcaxente.

The 'Entombment' by Ribalta, in the cathedral of Valencia, is an excellent work, and there are also many admirable pictures by him in private collections in Valencia, as those of the Conde de Parcent, and the Marques del Rafol. The Corpus Christi College is, according to Mr. Ford, a complete museum of Ribaltas. It was founded by Ribalta's patron, the Archbishop Juan de Ribera, commonly called 'El Santo Ribera.' He was canonised in 1797. Ribalta is to be seen to greatest advantage in the church of this college, which contains some of his greatest works, as 'San Vicente de Ferrer visited on his sick Bed by our Saviour and Saints;' the 'Last Supper,' already mentioned; and a 'Holy Family.' In other parts of the same building are 'Christ in the Garden of Olives;' 'Christ at the Column,' and a saint or 'Beata' in a brown habit. There are also some works by Ribalta in the Museo (the former 'Carmen') of Valencia. The pictures of the church of the small hamlet of Andilla are also among the best works of Ribalta. At Segorbe, in the church of San Martin de las Monjas, is also a noble picture by Ribalta of Christ descending into Hades. In the church of his native place Castellon de la Plana there is still a 'Purgatory' by him; other fine works that were in this place have been allowed to perish. The picture of 'Christ bearing his Cross' in Magdalen College, Oxford, of which there is a print by Sherwin, and which is ascribed to Guido, Lodovico Caracci, and to Moralez el Divino, is, according to Mr. Ford, certainly a picture by Ribalta. It is the chapel altar-piece, and was presented to the college by William Freeman, of Hamels, in Hertfordshire; it was originally brought from Spain by the last Duke of Ormond from Vigo in 1702.

JUAN DE RIBALTA, an able painter, and of great promise, was the son and pupil of Francisco, but he died in the same year as his father, aged only 31; he was born in 1597. Ribera also, or Spagnoletto, is said to have been the pupil of Ribalta.

RIBERA, JOSÉ, an eminent Spanish painter, better known by the surname of SPAGNOLETTO (the little Spaniard), which the Italians gave him, was born on the 8th of January 1588, at San Felipe de Xativa, a large town in Spain, about ten miles from Valencia. Having from his early youth shown a great inclination for painting, his parents, though in indigent circumstances, did everything in their power to promote his taste for that art. He was placed as a student under Francisco Ribalta (RIBALTA, FRANCISCO), but before he was sixteen he left his master, and determined to visit Italy. After spending some time at Rome, where he almost lived upon charity, he arrived at Naples in 1606. Here he met with Michel Angelo Caravaggio, whose striking and vigorous style made such an impression upon him that he never rested until he became his pupil. Under this master Ribera made such progress, and his productions were so much admired, that he was considered an accomplished master at the age of twenty. From Naples, Ribera went to Parma, where the works of Correggio were then the object of public admiration, and afterwards he visited Rome. Whilst there he attempted to improve his style by imitating the works of Raffaele, but without much success. This circumstance, as well as the great number of excellent artists practising in that city, induced him to return to Naples, where his prospects of employment were greater, that country being then under the dominion of his countrymen the Spaniards. After a few months' residence at Naples, the Count of Monterrey, the Spanish viceroy, took him under his protection, and employed him in executing considerable works for the King of Spain. In 1630 he was elected a member of the Academy of St. Luke at Rome, and he was made a knight of the order of Christ by the pope in 1644. Ribera died at Naples in 1656. Like his master Caravaggio, his style was characterised by broad lights and shades. His genius naturally inclined him to gloomy or horrible subjects, which he selected both from sacred and profane history. He delighted in designing old men emaciated by mortification, such as hermits and saints, and seems to have at all times rejoiced in the display of bone, veins, and tendons. In tragic compositions, martyrdoms, executions, and torments, he was eminently successful; and he treated these appalling subjects with a correctness of design and a fidelity which might serve as a study for the anatomist. Thus the spasms of Ixion, S. Bartholomew under the butcher's knife, the torments of Sisyphus, Tantalus, and Prometheus, Laocoon and his sons attacked by serpents, were his favourite subjects. His principal pictures are in the Royal Museum at Madrid, in the Escorial, and at Naples, in which last place he painted the 'Martyrdom of S. Januarius,' for the royal chapel; 'S. Jerome and S. Bruno,' for the church of the Trinity; and the 'Taking Down from the Cross,' for the Carthusians. Ribera

sometimes indulged himself in engraving, and he also made six-and-twenty etchings, which were executed in a bold and free style, and with great correctness of design.

RICARDO, DAVID, was born in London, on the 19th of April, 1772. His father, a native of Holland, had then been for several years a member of the Stock Exchange in London; and designing his third son, David, for the same occupation, gave him a good but plain commercial education. For this purpose he was sent when eleven years of age, to a school in Holland, where he remained for about two years. Soon after his return to England he was taken into his father's office as a clerk, and when of age was associated with him in business. In 1793 he formed a matrimonial alliance displeasing to his father, by reason of his religious scruples, the elder Mr. Ricardo having been born of Jewish parents, and continuing to profess their faith until his death. This breach between the father and son, which was afterwards entirely healed, necessarily caused their separation as regarded business, and threw the subject of this notice altogether upon his own efforts, seconded however, in a manner highly honourable to all parties, by many of the leading members of the Stock Exchange. Mr. Ricardo continued to be a member of the Stock Exchange until 1818, and was eminently successful, taking for many years a leading part in its business, and realising a princely fortune by conduct which gained for him universal respect.

During the years in which Mr. Ricardo was most actively engaged in business, he continued to devote much time to study and to scientific pursuits. He was one of the original promoters of the Geological Society of London, and for some years a member of its council. He also acquired a considerable knowledge of chemistry, as well as an acquaintance with mathematics. Of late years the powers of his mind were almost wholly devoted to the elucidation of questions connected with political economy, a study which was at once best suited to the peculiar quality of his mind and most in unison with his daily pursuits in business, and by his attainments in which he was enabled to take his place among the most original thinkers of his day.

In the beginning of 1819 Mr. Ricardo was returned to parliament by the Irish borough of Portarlinton, which place he continued to represent until his death.

The reputation which Mr. Ricardo had previously acquired by his writings ensured to him the attention of the house on all occasions when he spoke, and not unfrequently induced the members present to call upon him for his opinion when the subject-matter of the debate was such as might receive light from his extensive knowledge. Although he confined himself in his parliamentary speeches almost entirely to subjects of finance, and such as fell strictly within the line of economical science, his reported speeches are numerous and of considerable value. During each of the five sessions in which he sat in parliament his name constantly appears as a speaker, and in the latest two years of the series (1822 and 1823) his addresses were very frequent. Those persons who had most narrowly watched the progress of his public career felt justified in predicting for him a future of the highest usefulness; and had his life been spared, it is reasonable to think that their predictions would have been fulfilled. At the close of the session of 1823 he retired to his estate of Gatcomb Park in Gloucestershire, and, after a very few days' illness, died on the 11th of September, of an inflammation of the brain, in the fifty-second year of his age.

Mr. Ricardo first appeared as an author during the discussion that led to and accompanied the famous Bullion Committee in 1810. His pamphlet, which was entitled 'The High Price of Bullion a Proof of the Depreciation of Bank Notes,' speedily passed through four editions, and occasioned the publication of several replies. His next publication was entitled 'A Reply to Mr. Bosanquet's Practical Observations on the Report of the Bullion Committee;' and however much opinions may at that time have been divided upon the subject, it has long since been generally acknowledged that the victory rested with Mr. Ricardo. Although the peculiar interest which attended those discussions has long since passed away, Mr. Ricardo's pamphlet will be read with pleasure by all who delight in marking the ease with which a man of superior talent can trace and exhibit the constant and active operation of general principles through all the intricacies of practical detail.

In 1815 Mr. Ricardo published 'An Essay on the Influence of a Low Price of Corn on the Profits of Stock,' in which he combated the justice of restrictions on the importation of corn; but the essay is chiefly remarkable for the doctrine which it propounds concerning rent. The following year produced 'Proposals for an Economical and Secure Currency, with Observations on the Profits of the Bank of England.' Mr. Ricardo's great work, that upon which his lasting fame as an economist must rest, 'On the Principles of Political Economy and Taxation,' was published in 1817, and was at once pronounced the most valuable contribution made to economical science since the days of Adam Smith. In 1822 Mr. Ricardo again appeared as the author of a tract entitled 'On Protection to Agriculture,' in which he exposed certain fallacies and prejudices of the landed proprietors. The effects of legislative protection afforded to products of the soil upon wages, profits, public revenues, and non-agricultural branches of the national industry, are all discussed within the limits of eighty-seven pages, with a clearness and precision that may be said to exhaust the matter, and which prove the author to have been perfect master of

the whole subject. The only remaining work of Mr. Ricardo was found among his papers after his death, having been the latest matter of a public character that occupied his attention. This was his pamphlet in recommendation of a national bank, which was soon afterwards published by his family, in the exact state in which he left it probably only a few days before his death.

RICAUT, SIR PAUL. [RYCAUT.]

RICCI or RIZZI, SEBASTIANO, a painter, born at Cividale di Belluno, near Trevisano, in the Venetian state, in 1659 or 1660. He was placed early under the tuition of Frederigo Cervelli, at Venice. He accompanied his preceptor to Milan, and afterwards went to Bologna and Venice, to study the master-pieces of those two schools. He resided for some years at Florence and Rome, and ultimately made a tour of the whole of Italy, executing pictures at any price, wherever he obtained commissions, and leaving behind him a reputation almost universal. He afterwards travelled into Germany, England, and Flanders, completing his style from a careful study of the works of other artists, and especially improving in his mode of colouring. At Vienna he executed many works for the court, particularly some paintings on the walls of the imperial palace of Schönbrunn, and thence he returned to Florence, where he was employed to decorate several of the apartments in the palace of the grand-duke. Being invited to England by Queen Anne, he travelled through France, and at Paris was made a member of the Academy of Painting. In the cupola of Chelsea Hospital he represented the Ascension, and he also decorated the staircase of Montague House, afterwards the British Museum, and now pulled down. He likewise painted the chapel at Bulstrode, for the Duke of Portland, in the altar-piece of which, representing the Last Supper, he has introduced his own portrait in a modern habit. The hall and some of the ceilings of Burlington House, London, are also by him. During his residence in England, which lasted ten years, he was most extensively employed, and his departure is said by Walpole to have been caused by disgust that Sir James Thornhill should have been selected to paint the dome of St. Paul's Cathedral.

On quitting this country he returned to Venice, where he was constantly occupied on pictures for France, Spain, Portugal, and Sardinia. Ricci, in common with Luca Giordano, possessed the power of imitating with considerable facility the style of the great masters who preceded him. Some of his pictures appear at first sight as if painted by Bassano or Paul Veronese, and one of his Madonnas, exhibited at Dresden, was for some time attributed to Coreggio. Sebastiano is in fact rather an imitator than a plagiarist, as in the Last Supper, in the church of Santa Giustina, at Padua, which greatly resembles the cupola of San Giovanni at Parma, by Coreggio; and his San Gregorio, at San Alessandro in Bergamo, recalls to mind the work of Guercino at Bologna. The same may be observed of his scripture histories, painted for S. Cosmo and S. Damiano, at Venice, which are preferred to any others that he executed for that place. Ricci's figures exhibit much beauty and grace, like those of Paul Veronese; his attitudes are natural and varied, and his composition is managed with judgment. His colouring is distinguished by a beautiful azure, which remains in his fresco works, but in his pictures in oil, from the badness of the grounds, that as well as the other tints has faded. In many of his works he was assisted by his nephew Marco Ricci, who resided with him in England.

Sebastiano died at Venice, on the 5th of May 1734. Amongst the most noted of his productions may be enumerated the Massacre of the Innocents, at Venice; the Rape of the Sabines at Rome; at Bergamo, Saint Gregory supplicating the Virgin in favour of the Souls in Purgatory, before referred to; at Vienna, several ceilings of the imperial palace, and an Assumption of the Virgin, at the church of St. Charles.

RICCIARELLI, DANIELE, generally called DANIELE DI VOLTERRA, from the place of his nativity, was born in 1509. He appears to have first studied at Siena, under Antonio Razzi, called Il Sodoma, and afterwards under Baldassare Peruzzi. In the expectation of receiving greater encouragement at Rome, he repaired to that city, where he was first employed as an assistant to Pierino del Vaga in the Vatican, and in the Capella Massimi, in the church of the Trinità del Monte. He was chiefly indebted for the reputation which he subsequently acquired to the friendship and instruction of Michel Angelo, who gave him designs for the works which he executed in the Farnesina, and for others of his most celebrated performances. The principal monument of his fame was the series of frescoes in the church of La Trinità del Monte, representing the History of the Cross, on which he was employed seven years. Of these frescoes, the most remarkable was the famous Descent from the Cross, which was universally esteemed as one of the three finest pictures at Rome; the other two being the Transfiguration by Raffaele, and the Communion of St. Jerome, by Domenichino. It has been affirmed that Michel Angelo not only assisted him by his advice, superintendence, and corrections, in the composition of this sublime performance, but that the figure of the Saviour and that of the Virgin Mary must have been the work of his master-hand. Unhappily we are unable to judge of the probability of this assertion; for the French, in their eagerness to possess so fine a work, barbarously attempted to detach the plaster from the wall, and broke it all to pieces. We have no means of judging of the grandeur of the composition but from the fine engraving of it by

Dorigny. On the death of Pierino del Vaga, in 1547, Ricciarelli was recommended by Michel Angelo to Pope Paul III. as superintendent of the works in the Vatican, of which, and of his pension, he was deprived by Julius III. Pope Paul IV., conceiving that the nudity of several figures in the Last Judgment was unsuitable to the sanctity of the place, had determined to destroy that great work; when Daniele undertook, and, according to a tradition which appears to be authentic, with Michel Angelo's own consent, to clothe the offensive figures. He was probably induced to do this, in order to save the picture from destruction, for which however he was ever afterwards called in ridicule Braghetone. He died at Rome, 1566.

RICCIO, DOMENICO, called IL BRUSASORCI, a celebrated Venetian painter, was born at Verona in 1494. He was the pupil of Giolifino, and is supposed also to have studied under Titian, in Venice, where he at least studied his works and those of Giorgione. He is called the Titian of the Veronese painters. His name of Erusa Sorci (rat-burner) was acquired from his father Giacomo Riccio, who invented a rat-trap, and had what he caught in his own house burnt, whence he was commonly called by his neighbours Brusasorci, a name which descended to his children and grandchildren. Among Domenico's first and principal works in Verona were the frescoes of the Palazzo de' Murari, near the Ponte Nuovo, which he decorated exteriorly in chiaroscuro with scenes from the fable of Cupid and Psyche, and the marriage festival of Benacus (the Lago di Garda) with the nymph Charis represented by Garda; he painted numerous nymphs, with Hymen, as he is described by Catullus ('Carmen' 61-62), and all the characteristics of rural and sylvan life, poetical and real; and also in distinct compartments extensive groups of marine deities, and other corresponding mythic creations, for all of which he received only forty ducats. In the Palazzo Ridolfi he painted the celebrated cavalcade of Clement VII. and Charles V., at Bologna, on the consecration of the emperor, in which he introduced many portraits; these frescoes are still in preservation. Riccio painted also many excellent works in oil, including several large altar-pieces for some of the principal churches in and near Verona, and other works in the ducal palace at Mantua. Venuses and nymphs were also favourite subjects with him; and such pictures frequently occur in picture galleries. He died in 1567.

FELICE RICCIO, or BRUSASORCI, his son, was also a distinguished painter; but having studied under Ligozzi at Florence, he painted in a different style from his father: more delicate, but with less power; he was a good portrait painter. He died in 1605, aged sixty-five. His sister Cecilia Brusasorci was also an excellent painter of portraits. Giovanni Battista Brusasorci, another son of Domenico, was painter to one of the German emperors, and died in Germany.

RICCIO'LI, GIOVANNI BATTISTA, was born at Ferrara in 1598, and became one of the principal cultivators of astronomy in Italy during the greater part of the 17th century. He entered into the Society of the Jesuits in 1614, and having diligently cultivated all the different branches of learning as they were taught in that age, he was chosen teacher of philosophy, rhetoric, poetry, and theology in the colleges of their order at Parma and Bologna; but his inclination leading him to the study of geography and astronomy, he gave up his appointments, and applied himself wholly to the prosecution of those sciences. His first published work was the 'Almagestum novum' (1653), which constitutes a treatise on astronomy. In it he mentions the origin of the science, and gives a list of those who had cultivated it: he also describes his method of measuring a degree of the earth's surface, and a pendulum of his own invention. He computes the obliquity of the ecliptic, the length of the tropical year, and the elements of the orbits of the sun, moon, and planets; he also treats of eclipses, and gives a long list of such as had been observed from the earliest time. The work contains a treatise on parallaxes, and some ideas of the writer concerning the body of the moon.

The learned world was then divided between the followers of Aristotle and the disciples of Copernicus in their opinions respecting the system of the universe. In the 'Almagestum,' Riccioli, having explained the ideas of Copernicus concerning the movement of the earth, offers a long series of objections to them, which, with a brief reply to each, may be seen in Delambre ('Histoire de l'Astron. Mod.,' tom. i. p. 672, &c.). He acknowledges however that the more we examine the hypothesis of the earth's several motions, the more we must admire the genius and sagacity of Copernicus, who had been able to explain so simply the phenomena of the heavens; and he expresses his regret that the fruits of a brilliant imagination should be set forth as realities. The admiration constantly expressed for Copernicus, and even the manner in which the objections to his theory are stated, have led to a belief that this learned Jesuit was a Copernican in his heart; and from a passage in the work, it appears that the Aristotelians and theologians of that day, in their opposition, were more afraid of the consequences of making concessions in favour of a theory which seemed to them to be at variance with the letter of the Scriptures, than inimical to the theory itself. The 'Almagestum' contains many passages which betray the prejudices of the age. As a reason for the necessity of reforming the calendar, Riccioli asserts that the blood of St. Januarius continued to liquefy on the 19th of September, though the time of the equinoxes had been anticipated by ten days: he finds several causes for the supposed eclipse of the sun which took place at the death of Christ, and he dwells at some

length upon those which, it has been imagined, will immediately precede the end of the world.

In 1661 Riccioli published a work on geography and hydrography, in which is given an account of the operations which, in conjunction with P. Grimaldi, he had carried on in order to determine the length of a degree of the terrestrial meridian. For this purpose a base-line was measured near Bologna, and a triangulation was formed between that city and Modena; the stations appear however to have been improperly chosen, for the angles between them are often less than eight degrees, and only two were observed in each triangle. The instrument employed for obtaining the terrestrial angles was similar to the parallactic rulers of Ptolemaeus; and, in reducing the distances between the stations to one spherical surface, Riccioli assumed the refraction as constant, and equal to thirty minutes, as it had been determined by Tycho Brahé for celestial bodies in the horizon. The latitudes of the stations were determined by the sun and certain stars, their altitudes being observed with a quadrant whose radius was eight feet; but the declinations were taken from the catalogue of the astronomer just mentioned, and consequently were liable to errors amounting to one minute or more. It appears also that Riccioli entertained an opinion that the measures of the ancients were nearly correct; hence, among his observations, he made choice of such as gave results which approached the nearest to those measures, and thus his determination of the length of a degree is found to have been very erroneous. The value expressed by 64,365 paces of Bologna (=66,772 Eng. fath.), which he obtained by one of his methods, is considered by him as possessing an evidence in its favour which nothing can resist; it however differs far more from the truth than the determination of Snell, which had been made a few years previously in France; and in fact it is too great by above 6000 fathoms. The same work contains some remarks on the variation of the magnetic needle, observations on geographical longitudes and latitudes, and several problems relating to navigation.

Lastly, in 1665, Riccioli published his '*Astronomia Reformata*,' a work in which he treats of refractions and parallaxes, and describes the instruments which he used to determine the places of the stars. He also gives a collection of the observations previously made on the planets, and he compares them with the astronomical tables which had then been published. The work concludes with several tables relating to chronology, geography, and astronomy, and with a catalogue of stars. Riccioli died in 1671, at the age of seventy-three.

RICH, CLAUDIUS JAMES, was born on the 28th of March 1787, near Dijon in Burgundy, and, while yet an infant, was carried to Bristol, where he spent the early years of his life. He received a good education, and was early distinguished by his extraordinary powers in the acquisition of languages. At the age of eight or nine he happened to see some Arabic manuscripts in the library of a gentleman at Bristol, and was seized with a strong desire to acquire that language. This accidental circumstance led him to study the Oriental languages, in which he made such proficiency as to be able to read with considerable facility the Arabic, Hebrew, Syriac, Persian, and Turkish languages by the time he had attained his fifteenth year. His extraordinary acquirements in Oriental literature induced a friend to obtain for him, in 1803, the appointment to a cadetcy in the East India Company's service; and he was shortly after presented with a writership in the Bombay establishment by Mr. Parry, the chairman of the board of directors, in consequence of the strong recommendation of Sir Charles Wilkins. To enable him to perfect himself in the Arabic and Turkish languages, he was attached as secretary to Mr. Lock, who was at that time proceeding to Egypt as consul-general; and after the death of Mr. Lock, which happened before Mr. Rich joined him, he was allowed by the court of directors to prosecute such a course of travel as it was supposed might be most conducive to the object which he had in view. He accordingly went to Constantinople and Smyrna to study the Turkish language, and thence proceeded to Egypt to perfect himself in the Arabic and its various dialects. After leaving Egypt, he travelled over a great part of Palestine and Syria in the disguise of a Mameluke, and, confiding in his knowledge of the Turkish language and manners, ventured to visit the grand mosque at Damascus, while the great body of pilgrims was assembled at that city on their way to Mecca. From Syria he proceeded by Mardin and Baghdad to Bussora, whence he sailed for Bombay, which he reached in September 1807.

On his arrival at Pombay, he resided at the house of Sir James Mackintosh, to whom he had been introduced by the Rev. Robert Hall previous to his departure from England. In the following year he married the eldest daughter of Sir J. Mackintosh, and was shortly afterwards appointed the East India Company's resident at Baghdad, where he remained for about six years. During this time he prosecuted with the greatest diligence his favourite studies. He formed a rich collection of Oriental manuscripts, and also of medals and coins, and of the gems and engraved stones found at Babylon, Nineveh, Ctesiphon, and Baghdad. He made an excursion to Babylon in 1811 for the purpose of examining the ruins of that city, and afterwards published at Vienna, in the '*Mines de l'Orient*,' a '*Memoir on the Ruins of Babylon*,' which was subsequently reprinted in this country. In consequence of a paper published by Major Rennell, in the '*Archæologia*,' containing '*Remarks on the Topography of Ancient Babylon*,

suggested by the recent Observations and Discoveries of C. J. Rich, Esq., in which he questioned some of his conclusions, Mr. Rich undertook another journey to Babylon, and in 1813 published, in London, a '*Second Memoir on Babylon*,' in which he endeavoured to confirm the correctness of his first account; to this memoir he also added a valuable appendix on Babylonian antiques, illustrated by engravings, which represent fac-similes of many cuneiform inscriptions found upon bricks at Babylon: recent investigations have confirmed many of his views. A second edition of these Memoirs, with the narrative of Mr. Rich's journey to Babylon in 1811, and to Persepolis in 1821, was published by his widow in 1839.

In 1813 Mr. Rich, being compelled by bad health to leave Baghdad for a time, travelled to Constantinople, and subsequently to Paris. He returned to Baghdad in 1815, where he resumed his former pursuits, and made large additions to his collection of manuscripts and antiques. During this time he made the second excursion to Babylon already referred to; and in 1820 he made a tour into Koordistan. He went as far east as Sinna, and visited Sulimania, Mosul, and the ruins of Nineveh, and returned from Mosul to Baghdad down the Tigris. The journal which he kept on this occasion was published in 1836 by his widow under the title of '*Narrative of a Residence in Koordistan*,' and was accompanied by a valuable map of the country between Sinna, Arbil, and Mosul, which was drawn up from Mr. Rich's survey and astronomical observations. On his return to Baghdad he intended to proceed to Bombay, where he had been appointed to an important office by the Hon. Mountstuart Elphinstone, who was then governor; but in consequence of an attack made upon the residency by the orders or with the connivance of the pasha, he retired to Bussora. While waiting for instructions from his own government, he employed his time in a tour to Shirauz, whence he visited the ruins of Persepolis and other remains of antiquity in that neighbourhood. While at Shirauz he was attacked by the cholera morbus, and died of that disease on the 5th of October 1821.

Mr. Rich's death was a great loss to his private friends and to oriental literature. His disposition was amiable and kind, and his knowledge of many oriental languages such as few Europeans have ever possessed. The '*Memoirs*' on Babylon were the only writings which he published in his lifetime, with the exception of a few articles in the '*Mines de l'Orient*;' but he left behind him a considerable number of papers on various subjects. His collection of oriental manuscripts, coins, and antiquities, was purchased by parliament for the British Museum. Mr. Rich, during his second residence at Baghdad and on his various excursions, was unwearied in his astronomical observations. He has left a very complete series of eclipses of Jupiter's satellites, and numerous altitudes of stars and lunar distances, most of which are computed, and the results in latitude and longitude deduced. His zeal as an observer may be estimated from the fact that when taking the sun at Baghdad the metal of his sextant was frequently too hot to be touched without pain; and after the most fatiguing marches, and while labouring under severe indisposition, he seized every favourable opportunity of fixing his position astronomically.

(*Brief Notice of the Life of Mr. Rich* prefixed to Mr. Rich's '*Narrative of a Residence in Koordistan*')

RICHARD I., King of England, surnamed CŒUR DE LION, was the third son of Henry II., and his queen Eleanor, and was born at Oxford, in the king's manor-house there, afterwards the monastery of the White Friars, in September 1157. The history of the earlier part of the life of Richard has been already detailed. [HENRY II.] By the treaty of Montmirail, concluded on the 6th of January 1169, between Henry and Louis VII. of France, it was stipulated that the duchy of Aquitaine should be made over to Richard, who should do homage and fealty for it to Louis, and should espouse Adelaïs, or Alice, that king's youngest daughter; and in 1170, Henry, being taken ill at Domfront, in Maine, made a will, by which he confirmed this arrangement. In 1173, Richard, with his younger brother, Geoffrey, and their mother, joined their eldest brother, Henry, in his first rebellion against their father; on the submission of the rebels, in September 1174, Richard received two castles in Poitou, with half the revenue of that earldom, and, along with Geoffrey, did homage and swore fealty to their father. Nevertheless, Richard continued from this time to hold the government of the whole of Aquitaine, and to be usually styled, as before, Duke of Aquitaine, or Duke of Poitou (which were considered as the same title), although it appears that Henry now looked upon the arrangements made at the treaty of Montmirail as annulled, and that dukedom to have actually reverted to himself. In 1183 Richard refused, when commanded by his father, to do homage for Aquitaine to his elder brother Henry, on which Henry and Geoffrey invaded the duchy, and a new war ensued between them and their father assisted by Richard, which however was terminated by the death of the eldest of the three brothers in June of that same year, when Richard became his father's heir apparent; but at an interview between King Henry and Philip Augustus of France, in November 1188, Richard, apparently impelled by a suspicion that his father intended to leave his crown to his younger brother John, and also professing to resent Henry's conduct in withholding from him his affianced bride, the French king's sister, suddenly declared himself the liegeman of Philip for all his father's dominions in France; whence arose a new war, in which Philip and Richard

speedily compelled Henry to yield to all their demands, and a treaty to that effect was about to be signed when Henry died, on the 6th of July 1189. Richard was present at the burial of his father in the choir of the convent of Fontevraud.

Notwithstanding his apprehensions, real or affected, of his brother John, Richard made no particular haste to come over to England; but, contenting himself with ordering his mother Queen Eleanor to be liberated from confinement, and to be invested with the regency of that kingdom, he first proceeded to Rouen, where he was formally acknowledged as Duke of Normandy, on the 20th of July; and it was the 13th of August before he arrived at Portsmouth (or, as others say, at Southampton). His coronation, from which the commencement of his reign is dated, took place in Westminster Abbey on the 3rd of September. It was on occasion of that ceremony that a furious riot broke out against the Jews in London, which was in the course of the next six months renewed in most of the great towns throughout the kingdom. At York, in March 1190, a body of 500 Jews, with their wives and children, having taken refuge in the castle, found no other way of saving themselves from their assailants, than by first cutting the throats of the women and children and then stabbing one another.

A short time before his father's death, Richard and his then friend Philip Augustus, had, as it was expressed, taken the cross, that is to say, had publicly vowed to proceed to the Holy Land, to assist in recovering from the infidels the city and kingdom of Jerusalem, which had recently (1187) fallen into the hands of the great Saladin. The mighty expedition, in which all the principal nations of Western Christendom now joined for the accomplishment of this object, is known by the name of the Third Crusade. Leaving the government of the kingdom during his absence in the hands of William Longchamp, bishop of Ely and chancellor, and Hugh Pudsey, bishop of Durham and justiciary, Richard took his departure from England on the 11th of December of this same year 1189, and, proceeding to Normandy, united his forces with those of Philip Augustus in the plain of Vezelai, on the 1st of July 1190. The two friends proceeded together at the head of an army of more than 100,000 men as far as Lyon, where they separated on the 31st; Philip taking the road to Genoa, Richard that to Marseille, where he was to meet his fleet. The fleet however not arriving so soon as was expected, Richard in his impatience hired thirty small vessels for the conveyance of himself and his suite, and, sailing for Naples, arrived there on the 28th of August. On the 8th of September he proceeded by sea to Salerno, where he remained till the 23rd, and then sailed for Messina, which port his fleet had reached about a week before, with the army, which it had taken on board at Marseille. The French king had also arrived at Messina a few days before his brother of England.

The two kings remained together at Messina till the end of March, 1191. During their stay Richard compelled Tancred, who had usurped the crown of Sicily, to relinquish the dower of his sister Joan, the widow of William, the late sovereign, and to pay him besides 40,000 ounces of gold. In return he betrothed his nephew Arthur, the son of his next brother, Geoffrey, to Tancred's infant daughter, and formed a league offensive and defensive with the Sicilian king—a connection which afterwards cost him dear, for it was the source of the enmity of the Emperor Henry VI., who had married Constantia, the aunt of William, and claimed the throne of Sicily in right of his wife. After the dispute with Tancred had been settled, the latent rivalry of Richard and Philip broke out in a quarrel about the Princess Adalais, whom her brother Philip insisted that Richard should espouse, in conformity with their betrothment, now that his father no longer lived to oppose their union. But if Richard had ever cared anything for the French princess, that attachment had now been obliterated by another which he had some years ago formed for Berengaria, the beautiful daughter of Sancho VI. (styled the Wise), king of Navarre; in fact, he had by this time sent his mother Eleanor to her father's court to solicit that lady in marriage, and, his proposals having been accepted, the two were now actually on their way to join him. In these circumstances, Philip found himself obliged to recede from his demand; and the matter was arranged by an agreement that Richard should pay a sum of ten thousand marks in five yearly instalments, and restore Adalais, with the places of strength that had been given along with her as her marriage portion, when he should have returned from Palestine.

Richard, having sent his mother home to England, sailed from Messina on the 7th of April, at the head of a fleet of above two hundred ships, of which fifty-three were large vessels of the sort styled galleys; his sister the queen dowager of Sicily and the Princess Berengaria accompanying him. The king of France had set sail about a week before. Several months however elapsed before Richard reached the Holy Land, having been detained by an attack which he made upon the island of Cyprus; Isaac, the king or emperor of which had ill used the crews of some of the English ships that had been driven upon his coasts in a storm. Richard took Limasol, the capital, by assault; and that blow was soon followed by the complete submission of Isaac and the surrender of the whole island. Isaac was put into confinement, and remained a captive till his death in 1195. Meanwhile the island of Cyprus was made over by Richard in 1192 to Guy of Lusignan, upon his resignation of the now merely titular royalty of Jerusalem to

his rival Henry of Champagne; and Guy's posterity reigned in that island till the year 1458.

Having married Berengaria at Limasol, Richard set sail from Cyprus on the 4th of June (1191), with a fleet now described as consisting of thirteen large ships called busses, fifty galleys, and a hundred transports; and on the 10th he reached the camp of the Crusaders assembled before the fortress of Acre, the siege of which had already occupied them not much less than two years, and had cost the lives, it is said, of nearly two hundred thousand of the assailants. But the presence of the English king, although he was suffering from severe illness, and had to be carried to the trenches on a litter, immediately inspired so much new vigour into the operations of the Christian army, that on the 12th of July the place surrendered, and Saladin, who had been harassing the besiegers from the neighbouring mountains, withdrew in conformity with the terms of capitulation. This great event however was immediately followed by an open rupture between Richard and King Philip, whose rivalry had already exhibited itself in a variety of ways, and more particularly in the support given by Richard to the claim of Guy of Lusignan, and by Philip to that of Conrad of Montferrat, to the vacant crown of Jerusalem. Philip in fact took his departure from Palestine on the last day of July, leaving only ten thousand men under the command of the Duke of Burgundy.

Richard performed prodigies of valour in the Holy Land; but, although a signal defeat of Saladin on the 7th of September was followed by the capture of Jaffa and some other places of less importance, Jerusalem, all along professedly the main object of the crusade, so far from being taken, was not even attacked. Jaffa however, after it had again fallen into the hands of Saladin, was recovered by the impetuous valour of the English king. At last, on the 9th of October 1192, Richard set sail from Acre in a single vessel, his fleet, having on board his wife, his sister, and the daughter of the captive king of Cyprus, having put to sea a few days before. The three ladies got safe to Sicily; but the first land the king made was the island of Corfu, which he took about a month to reach. He left Corfu about the middle of November in three coasting-vessels which he hired there; but after being a few days at sea he was compelled by a storm to land on the coast of Istria, at a spot between the towns of Aquileia and Venice. After narrowly escaping first from falling at Goritz into the hands of Maynard, a nephew of Conrad of Montferrat (to whose murder in Palestine Richard, upon very insufficient evidence, was suspected to be an accessory), and then at Freisach from Maynard's brother, Frederic of Beteow, he was taken on the 21st of December at Erperg, near Vienna, by Leopold, duke of Austria (a brother-in-law of Isaac of Cyprus), and was by him consigned to close confinement in the castle of Tyernsteign, under the care of his vassal, Baron Haldmar. In the course of a few days however, by an arrangement between Leopold and the Emperor Henry VI., the captive king was transferred to the custody of the latter, who shut him up in a castle in the Tyrol, where he was bound with chains and guarded by a band of men who surrounded him day and night with drawn swords. In this state he remained about three months. Meanwhile intelligence of his having fallen into the hands of the emperor had reached England, and excited the strongest sensation among all ranks of the people. A sketch of the course of events there during his absence has been given in the article JOHN. It is sufficient to mention, that a struggle for supremacy had for some time been carrying on with various success between the king's brother John and Longchamp, the chancellor, who had acquired the entire regency, and had also been appointed Papal legate for England and Scotland; and that this had issued, in October 1191, in the deposition of Longchamp by a council of the nobility held in St. Paul's Churchyard, London; after which he left the country, and although he soon ventured to return, ultimately deemed it most prudent to retire to Normandy. The supreme authority was thus left for a time in the hands of John, who, as soon as he learned the news of his brother's captivity, openly repaired to Paris, and did homage to the French king for the English dominions on the Continent.

On his return to England, John raised an army to support his pretensions, and his confederate Philip took up arms in his behalf in France, and, entering Normandy, overran a great part of that duchy, although Rouen, the capital, was preserved principally by the exertions of the Earl of Essex, lately one of Richard's companions in the Holy Land. In England also John met with a general opposition to his usurpation of the regal authority, which soon compelled him to conclude an armistice with a council of regency that had been appointed by the prelates and barons. This was the position of affairs when Longchamp, having discovered Richard's place of confinement, after much solicitation prevailed upon the emperor to allow the royal prisoner to be brought before the diet at Hagenau, where accordingly he made his appearance on the 13th of April 1193, and defended himself with so much eloquence against the several charges made against him in regard to Tancred and the kingdom of Sicily, to his conquest of Cyprus, and to the murder of Conrad of Montferrat, that Henry found himself compelled by the general sentiment of the diet to order his chains to be immediately struck off, and to agree to enter upon negotiations for his ransom. Longchamp was immediately despatched to England with a letter to the council of regency, and the result was, that, notwithstanding the insidious efforts both of John and his friend Philip of France to prevent the conclusion of the treaty,

Richard was at last liberated, on the 4th of February, 1194, after 70,000 marks had been actually paid to the emperor, and hostages given for the payment of 30,000 more. The English king had also engaged to release both Isaac of Cyprus and his daughter, and he had besides, at the persuasion, it is said, of his mother Eleanor, the more effectually to conciliate Henry, formally resigned his crown into the hand of the emperor, who immediately restored it to him to be held as a fief of the empire, and burdened with a yearly feudal payment to his superior lord of five thousand pounds. This strange transaction rests on the authority of the contemporary annalist Hoveden. Richard, descending the Rhine as far as Cologne, proceeded thence across the country to Antwerp, and, embarking there on board his own fleet, landed at Sandwich on the 13th of March.

Most of John's strongholds had been wrested from his hands before his brother's return, and now the rest immediately surrendered, and he himself fled the country, and with his principal adviser, Hugh, bishop of Coventry, having been charged with high treason, and not appearing to plead after forty days, was outlawed and divested of all his possessions.

Meanwhile it was thought necessary that Richard should be crowned again, and that ceremony was accordingly performed at Winchester by Hubert, archbishop of Canterbury, on the 17th of April. Then, leaving Hubert guardian of England and grand-justiciary, on the 2nd of May following, having, with his characteristic activity, employed almost every moment since his arrival in raising an army and procuring funds for its maintenance by all sorts of exactions and the most unscrupulous use of every means in his power, he again set sail from Portsmouth, his whole soul bent on chastising the king of France. Owing to adverse winds, he was a fortnight in reaching Barfleur in Normandy, where, as soon as he landed, he was met by his brother John, who professed contrition and implored his pardon, which, on the intercession of his mother Eleanor, was granted. Richard now marched against Philip, and several engagements took place between them, in most of which the English king was successful. But the war, though it lasted for some years, was distinguished by few remarkable events. A truce for one year was agreed to on the 23rd of July; and, although hostilities were resumed some time before the expiration of that term, a peace was again concluded in the end of the following year, which lasted till the beginning of 1197.

All this time Hubert, assisted by Longchamp, who had been restored to his office of chancellor, is said to have presided over the government at home with great ability. Hubert had been educated under the famous Glanvil, and he seems, in the spirit of his master, to have exerted himself in re-establishing and maintaining the authority of the law, by which alone, even if he did no more, he must have materially contributed to the revival of industry. The large sums however which he was obliged to raise by taxation to meet the expenses of the war, in the exhausted state to which the country had been reduced, provoked much popular dissatisfaction; and the third year of the king's absence in particular was distinguished by the remarkable commotion excited by William Fitz-Osbert, styled Longbeard, a citizen of London, who is admitted to have possessed both eloquence and learning, and whose whole character and proceedings might not improbably, if he had had his own historian, have assumed a very different complexion from what has been given to him. Longbeard, who acquired the names of the Advocate and King of the Poor, is affirmed to have had above 50,000 of the lower orders associated with him by oaths which bound them to follow whithersoever he led. When an attempt was made to apprehend him by two of the wealthier citizens, he drew his knife and stabbed one of them, named Geoffrey, to the heart, and then took refuge in the church of St. Mary-le-Bow in Cheapside, the tower of which he and his followers fortified, and held for three days, when they were at last (7th of April 1196) dislodged by fire being set to the building. Fitz-Osbert was first dragged at a horse's tail to the Tower, and then to the Elms in West Smithfield, where he was hanged, with nine of his followers. The people however long continued to regard him as a martyr.

The war between Richard and Philip broke out again in 1197, and in the course of this campaign Richard had the gratification of capturing the Bishop of Beauvais, a personage whom he had reason to regard as a main instigator of the severities and indignities which he had sustained at the hands of the emperor. The bishop was taken armed cap-à-pie and fighting, and when Pope Celestine recommended him to the clemency of Richard as his son, the English king sent his holiness the bishop's coat of mail, with the following verse of Scripture attached to it:—"This have we found: know now whether it be thy son's coat or no." This same year too finished the career of the Emperor Henry, who in his last moments is said to have expressed the extremest remorse for the manner in which he had treated the great champion of the Cross. Richard's other enemy, Leopold, duke of Austria, had been killed by a fall from his horse two years before.

A truce, as usual, at the end of the year, again suspended hostilities for a space. The war was renewed on its termination, and in this campaign (of the year 1198) Richard gained one of his greatest victories near Gisors, when Philip in his flight fell into the river Epte, and was nearly drowned. After this, by the intervention of the pope's legate, a truce was concluded between the two kings for five years, and they never met again in fight; although they probably would, notwith-

standing the truce, if both had lived. But on the 26th of March in the following year 1199, as Richard was engaged in reducing the castle of Chaluz, the stronghold of one of his Aquitanian vassals, Vidomar, viscount of Limoges, who it seems had refused to surrender a treasure found on his estate, to which the king laid claim in right of his feudal superiority, Cœur de Lion was struck in the left shoulder by an arrow, aimed from the rampart of the castle by a youth named Bertrand de Gurdun. The wound would not have been dangerous but for the mismanagement of the surgeon in his attempts to extract the arrow-head, which had broken off in the flesh. As it was, Richard lived only till Tuesday, the 16th of April. The shot was a fatal one in every way: in the fury into which the wound of the king threw the besieging army the castle was taken by storm, and all the persons found in it were immediately hanged, as some authorities say by the king's orders, with the exception only of Gurdun. He was brought into the presence of his dying victim, when Richard, under the impulse of generosity or compunction, gave him his liberty, with a hundred shillings to take him home; but after the king's death he was flayed alive, and then hanged, by order of Marchadee, the leader of the Brabantine mercenaries serving in Richard's army.

Richard I. had no issue by his wife Berengaria, but he is said to have had one or two natural children. He was succeeded on the throne by his youngest brother, John, to the exclusion of Arthur of Bretagne, the legitimate heir, as being the son of his next brother, Geoffrey. [JOHN.]

The character of Richard is one of course not to be judged without reference to the general manners of the age in which he lived. He is charged by writers of his own or near his own time with crimes of all sorts, and it is probable enough that there was hardly an excess, either of violence or licentiousness, into which his impetuous temperament did not occasionally precipitate him; but, besides the sanction or indulgence for all this accorded by public opinion and the universal example, it is also to be said for Richard that, with all his passion and recklessness—if his ungrateful rebellion against his father be left out of account—he seems to have had nothing base or malignant in his composition; and that he was as capable of acts of extraordinary generosity and disinterestedness as of excesses of brutal fury or profligacy. Of the courage and strength of will proper to his race, he had his full share, with more than his share of their strength of thew and sinew; and his intellectual powers, both natural and acquired, were also of a high order. He was renowned in his own day not only as beyond all dispute the stoutest and most gallant of living heroes, but as likewise occupying a place in the foremost rank of those who excelled in wit, in eloquence, and in song. A few of Richard's poetical compositions have been preserved, and may be found in the following works:—*'La Tour Ténébreuse,'* 1705, which contains a love-song in Norman-French, and another chanson in mixed Romance and Provençal, said to be the joint composition of Richard and his favourite minstrel Blondel de Nesle, and to be that by which Blondel, according to the well-known story, now generally believed to be a fiction, discovered his master's prison; Walpole's *'Royal and Noble Authors,'* which contains a poem of about forty lines in Provençal, from a manuscript in the Laurentine Library at Florence, another version of which in Norman-French (by some supposed to be the original), is given by Sismondi, *'Littérature du Midi de l'Europe,'* vol. i., p. 149, and of which there are two English versions, one published in Burney's *'History of Music,'* another by the late George Ellis, in Park's edition of Walpole's work; Raynouard's *'Choix des Poésies des Troubadours,'* vol. iv., containing the Provençal version of the same poem; and the *'Parnasse Occitanien,'* Toulouse, 1819, in which another poem of Richard's is given. Richard is also a distinguished character in romance; on which subject it may be sufficient to refer the reader to Ellis's *'Specimens of Early English Romances,'* vol. ii., pp. 175-290 (edit. of 1811).

The claim of Richard I. to the authorship of the ancient maritime code called the *'Laws of Oleron,'* has been proved to be unfounded. Almost the only improvement in the laws or institutions of England which is attributed to him is some reform of the institution of justices-itinerant introduced by his father, but it is not very clear in what this consisted; and, whatever it was, the merit of it appears to belong not to Richard, but to his viceroy Hubert. He is also said to have abolished some of the most cruel penalties of the forest laws, although he enforced that code generally with great exactness. What is called the time of legal memory, or the term requisite to establish immemorial usage, dates from the commencement of the reign of this king.

RICHARD II. (surnamed of Bordeaux), King of England, was the second but only surviving son of Edward, styled the Black Prince, eldest son of King Edward III., by his wife Joanna of Kent [EDWARD III.], and was born at Bordeaux on the 3rd of April 1366. He was consequently ten years and two months old when he lost his father, and not quite eleven years and three months when he succeeded to the throne on the death of his grandfather. His reign is reckoned to have commenced on the day following that event, the 22nd of June 1377. His coronation did not take place till the 16th of July.

On the accession of a king who was still a minor, the powers of government were, by an assembly of the prelates and barons, vested in twelve counsellors, who were appointed to assist, in other words to direct and control, the chancellor and treasurer. From this council

the king's three uncles—John of Gaunt, duke of Lancaster; Edmund of Langley, then earl of Cambridge, afterwards duke of York; and Thomas of Woodstock, then earl of Buckingham, afterwards duke of Gloucester—were all excluded; but this arrangement appears to have been collusive, and intended merely to lull the popular dislike and suspicion of Lancaster, in whose interest most of the counsellors are said to have been; and who, although he at first retired to his castle of Kenilworth, was the next year appointed to the command of a fleet fitted out to act against France. In the course of that year, 1378, great honour was obtained by John Philpot, a citizen of London, who, having equipped a small naval armament at his own expense, set sail with it against the Scottish privateer Mercer, who had recently carried off all the ships in the port of Scarborough, and succeeded in capturing him with all his prizes. During the next three years the war with France was prosecuted in Brittany under the conduct of the Earl of Buckingham; but the death of Charles V., in September 1380, having been speedily followed by a peace between the Duke of Brittany and the new French regency, Buckingham, now finding an enemy in his former ally, was glad to return home with his army in April 1381.

Meanwhile in England the heavy pecuniary exactions called for by the war were hastening on a crisis which other causes had been long contributing to bring about. Three contending forces may be distinctly perceived at work in the ferment which now broke forth. First, there was the crown, or rather its natural ally the ancient aristocracy, in whose hands the young king on the present occasion was, and of which he may be considered as the mere representative or instrument, striving to protect from encroachment the almost exclusive control of the national affairs which it had possessed at least from the era of the Conquest. Secondly, there was the recently-established House of Commons, the representative of the minor gentry and the middle classes, pressing forward to secure a share in the government, and, with the instinct of a growing power, eagerly seizing hold of every opportunity of forwarding its object, its chief means being the right of taxation, of which it was already in the undisputed enjoyment, and which it had learned to apply with considerable skill as a screw for compressing the crown, and extorting from it new concessions and privileges. It may be remarked that the present state of affairs, with the king a boy and a cipher, and the government in the hands of a regency, was peculiarly favourable for such attempts on the part of the House of Commons. Lastly, there was the great body of the population, forming the labouring class, of which by far the larger portion was yet engaged in agriculture, and in a state of villeinage or servitude, bound to the soil, and so confounded in some sort with the cattle and chattels of the landlord, counted, or at least treated, as *things*, not as *persons*, at any rate in so far as all rights of a political character were concerned. But the example of what had recently taken place in other countries, in France and in Flanders, and the progress that the development of society had made among ourselves, had inspired even this, the lowest class, with a general desire of acquiring a new position in the commonwealth—of being raised from bondage to freedom and citizenship. Of course, both on the part of the House of Commons (or middle classes), and still more on that of the villeins, what was reasonable and right in this ambition may have been mixed with much that was ill-considered, extravagant, and impracticable; their efforts may have been in some respects ill-directed, both in regard to ends and means; but in the main, what took place must have happened if society was to advance at all, or even if it was to retain any principle of life. The explosion of these various elements was provoked by the state of pecuniary necessity to which the crown was reduced in the years 1379 and 1380. First, to induce the Commons to grant the money that was wanted, it was found necessary, after a short struggle, to submit to their demands, of not only being allowed to inspect the accounts of the royal treasury, but even of appointing the king's ministers. Then, in December 1380, the famous Capitation Tax was imposed, which gave rise to the rebellion of Wat Tyler in the summer of the year following. This formidable movement began at Fobbinge, near Brentwood in Essex, on the 30th of May 1381, when the people rose against Thomas de Bampton, one of the commissioners who had been appointed to superintend the collection and enforce the payment of the tax. It thence spread over Essex, Kent, Suffolk, Norfolk, and other counties along the eastern and southern coasts; the most noted among the popular leaders being two priests called Jack Straw and John Ball. Watt, the Tyler (or tiler), of Dartford, who killed the royal tax-collector, in consequence of an outrage committed on Tyler's daughter, and then placed himself at the head of the Kent men, seems however to have been by far the most determined and ferocious of the rebel captains. Two other persons of the names of Lister and Westbroome, were called Kings of the Commons in Norfolk and Suffolk. In the earlier part of the month of June, Tyler and his followers, having marched upon London, perpetrated a series of frightful devastations: they sacked the archbishop's palace at Lambeth, demolished the Marshalsea and King's Bench prisons, and the Duke of Lancaster's palace of the Savoy, set loose the prisoners in Newgate and the Fleet, and destroyed the former building; set fire to the Temple, and to the Priory of the Knights Hospitallers at Clerkenwell; and massacred great numbers of the wealthier classes, among others the two first officers of the kingdom—

the Archbishop of Canterbury, who was chancellor, and Sir Robert Hales, the treasurer. At last, on the 15th, the career of the demagogue was suddenly terminated by the bold hand of Sir William Walworth, the lord mayor, who, when Tyler, coming forth from his men, rode up to the king stationed in front of the abbey of St. Bartholomew in West Smithfield, plunged a dagger into his throat, on which he was speedily despatched by one or two other persons in the royal suite. Richard himself on this occasion, young as he was, showed both firmness and presence of mind. The insurgents, deprived of their leader, were easily induced to lay down their arms; and in a few weeks the rising of the commons was completely suppressed in all parts of the kingdom. The victory obtained by the king and the government was followed by the shedding of torrents of blood on the scaffold: it is said that the persons executed amounted in all to about 1500; Straw, Ball, and the other leaders being among the number. All the promises also that had been made to the congregated multitudes while they had still arms in their hands were broken. The Essex men had only asked for the abolition of bondage, the fixing of a maximum for the rent of land, the universal liberty of buying and selling in fairs and markets, and a general pardon; and before they broke up and retired to their homes they had actually received a written grant of these demands under the king's hand. Even Wat Tyler and the men of Kent, when they came to specify their terms, had insisted upon nothing more extravagant than that the forest law should be repealed, and all warrens, waters, parks, and woods thrown open, so that the killing of fish, fowl, and game of all kinds should be everywhere free to every man.

On the 14th of January 1382, Richard was married to Anne of Bohemia, daughter of Charles IV., the late emperor of Germany. The next two years were filled up with a war against the French in Flanders, conducted by Henry Spenser, the young and fighting bishop of Norwich, who in the late commotions had distinguished himself by his decisive style of dealing with the rebels; first, as Froissart tells us, meeting them in the field, and then, when he had routed them, exchanging his sword and armour for a crucifix and sacerdotal robes, and thus arrayed, confessing and absolving his prisoners as he hurried them to the gibbet, and who now went over to the Continent to assist the burghers of Ghent in their contest with the Count of Flanders and the French king, and in support of the cause of Urban VI., in the general European war excited by the struggle between that pope and his rival Clement VII. The bishop in his first campaign defeated the Count of Flanders, and took the town of Gravelines; but in the spring of 1384 he was obliged to make his way back with much precipitancy to England, where he was arraigned by the parliament for the failure of the expedition, and his temporalities were confiscated till the king should be repaid the money it had cost. In 1385 the war with France was transferred to Scotland; and in the summer of that year Richard, for the first time, appeared at the head of his army, which penetrated as far as Aberdeen, having on its way reduced Edinburgh, Dunfermline, Perth, and Dundee to ashes, without having however during its whole progress seen the face of the enemy. An expedition of John of Gaunt to Spain, to assert his claims to the throne of Castile and Leon, grounded on his marriage with Constance, the eldest daughter of the late king Peter the Cruel, after occupying him for about three years, terminated, in 1383, in the marriage of the duke's daughter Catharine to Henry, prince of Asturias, the heir of the reigning Castilian king, John I., an alliance which seated the descendants of the English duke for many generations upon the throne to which he aspired.

Meanwhile, during the absence of the duke, the ascendancy at home had been assumed by his younger brother Thomas, now duke of Gloucester; and in the latter part of the year 1387, an ill-conceived and worse-directed attempt of Richard to take the management of affairs into his own hands had resulted in the complete defeat of that design by Gloucester, the execution of Richard's two principal counsellors, the Chief-Justice Treilian and Sir Nicholas Brember the lord mayor of London, and the expulsion of the Archbishop of York, and of the royal minions De Vere, duke of Ireland, and De la Pole, earl of Suffolk, from the kingdom. The "wonderful parliament," as it was called, which met on the 3rd of February 1388, after ratifying the proceedings of the victorious party, also sent Sir Simon Burley and three other knights to the scaffold, banished four more of the judges to Ireland, and in short completely put down the king's faction. On the 15th of August this year was fought the famous battle of Otterbourne, or Chevy Chase, in which the Scots lost their commander, Earl Douglas, but the English were finally driven from the field, after both their leader Lord Harry Percy (popularly designated Hotspur) and his brother Lord Ralph had fallen into the hands of the enemy.

Richard remained in the state of subjection to which he had been reduced by the "wonderful parliament" for more than a year. At last, at a great council held in May 1389, he unexpectedly intimated that, being now in his twenty-second year, he intended to take the management of affairs into his own hands; and the suddenness of the movement secured its success for the moment. Gloucester found it necessary to retire into the country. But, in fact, although no further attempt was made for the present formally to set Richard aside, his own indolence and indisposition to business very soon threw the government into the hands of his uncle Edmund, duke of York, and

Lancaster's son, Henry of Bolingbroke, earl of Derby. John of Gaunt also now returned from the Continent, and had influence enough to force a seeming reconciliation between his royal nephew and Gloucester, and to bring back that duke and his party to court. After this some years passed without any changes or other events of importance. The country was still professedly at war both with France and Scotland; but after the suspension of hostilities had been long kept up by a succession of short amnesties, a truce for four years was concluded with both countries in 1394. His queen, who was called "the good Queen Anne," having died on Whitsunday of that year, Richard soon after solicited the hand of Isabella, the beautiful but still infant daughter of Charles VI.; after many delays, the treaty of marriage was finally arranged in October 1396; and at the same time a further peace and alliance was concluded between the two countries for the space of twenty-eight years.

This French marriage is believed to have materially contributed to the domestic revolution that soon after followed. It was opposed before it was contracted, and reprobated afterwards, by Gloucester and the popular party; and on the other hand Richard is supposed to have counted upon the assistance of his father-in-law the French king, to enable him to rid himself of and avenge himself on his uncle. In the beginning of July 1397, first the Earl of Warwick, and two days after the Earl of Arundel, the most intimate friends and confederates of Gloucester were suddenly arrested by the orders of the king, who carried his project into effect with profound dissimulation and treachery; and a few days after Gloucester himself was seized in his castle of Plashy, in Essex, and immediately conducted a prisoner to Calais. A parliament was then called, which met on the 17th of September, and which, awed by the display of military force made by the king, and led by the example of the dukes of Lancaster and York and the Earl of Bolingbroke, all of whom Richard had previously seduced or forced into a public approval of the arrests, ratified all that had been done, and impeached the three peers, and also Arundel's brother, the Archbishop of Canterbury, of high treason. The archbishop and Warwick were banished for life; Arundel was beheaded on Tower-hill; and when an order was sent to the governor of Calais Castle to bring up his prisoner Gloucester, the answer returned was that he had died, and few doubted that he had been made away with by the king's orders. It was immediately after this affair that Bolingbroke was raised to the dignity of Duke of Hereford; Richard's half-brother, Sir John Holland (the son of his mother by her second husband), being at the same time made Duke of Exeter. The subservient parliament, before it separated, devolved the whole power of government and legislation upon a commission of twelve peers and six commoners, all devoted to the king; and having also obtained from them the grant of a revenue for life, Richard might now be considered as almost an absolute sovereign.

This state of things however did not last long. Intoxicated by the success of his schemes, Richard now set no bounds to his exactions and extravagance; and instead of being satisfied with the discomfiture and destruction of so many of the persons whose opposition he had had so much reason to fear, he seems to have been only thereby incited to the devising of means for ridding himself of others whom he still apprehended to be dangerous. Of those who had supported him in the prosecution of the late Duke of Gloucester and his friends, the two most powerful were the Duke of Hereford, and Mowbray, earl of Nottingham, now duke of Norfolk. While Hereford was riding from Windsor to London in December of this same year, he was overtaken by Norfolk, who, according to the account given by Hereford, more than hinted to him that he had reason to suspect the king was watching for an opportunity of destroying them both; his words were carried to Richard, probably by Bolingbroke himself; that nobleman, at any rate, when called upon in parliament to state what had passed, charged Mowbray with having given utterance to the treasonable expressions; and the result was, that after Mowbray had denied the charge, and the two had in compliance with the award of a court of chivalry, presented themselves on the 16th of September 1398, at Coventry, to decide the matter by wager of battle, Richard suddenly interposed, forbade the combat to proceed, and pronounced sentence of banishment for ten years on Hereford, and for life upon Norfolk. The issue of the duel, whatever it might have been, would probably have only delivered him from one of his enemies; this method removed both. But one of them doubtless resolved while professing for the moment to submit to the sentence, that he would not be long in returning. Henry of Bolingbroke had been for some time sedulously and successfully attracting to himself the popular favour which his cousin Richard was fast losing or throwing away; and probably no other subject whom the king might have banished from England could have carried the affections and hopes of so many of his countrymen along with him. This he himself well knew. Accordingly, when in the beginning of February 1399, about three months after his departure, his father died, and the estates which had now become his inheritance were seized by the crown, he did not hesitate as to the course which he should take. Richard had set sail from Milford Haven on the 31st of May, at the head of a fleet of two hundred transports, to quell an outbreak of some of the native tribes of the south of Ireland: Bolingbroke, now calling himself duke of Lancaster, landed at Ravenspur in Yorkshire, on the 4th of July.

The returned exile brought with him only forty followers; but by the time he had reached St. Albans, on his unimpeded march to the capital, his army had increased to sixty thousand men. The Duke of York, in whose charge the government had been left, withdrew towards Bristol, to which place the Earl of Wiltshire, Bussy, Green, and others of the king's friends and servants had previously fled. Bolingbroke merely showed himself to the citizens of London, and having received their plaudits and addresses of congratulation, set out for the west. York and he met in Berkeley Castle, where the regent after a short conference yielded to all his demands. They marched together to Bristol, where, having taken possession of the castle, Bolingbroke directed Wiltshire, Bussy, and Green, to be executed, and then set out for Chester, and established himself in that city. Meanwhile Richard, long detained by tempestuous weather, had at last landed at Milford Haven on the 5th of August. He brought with him the greater part of the army he had carried over to Ireland two months before; but the men nearly all deserted the first night they found themselves again upon English ground. Richard then disguised himself as a Franciscan friar, and, accompanied by the Duke of Exeter and some others of his friends, fled to Conway, where it was understood that the Earl of Salisbury was in command of a numerous royalist force; but upon his arrival he found that that too had broken up some days before. On the 13th the Earl of Northumberland came to him from Bolingbroke, and induced him to accompany him to Flint Castle, where, on the following day, Bolingbroke presented himself at the head of about 80,000 men. The unhappy king proceeded to Chester in the train of his conqueror, and thence in a few days he was carried to London, where he was forthwith lodged in the Tower. Here, on the 29th of September, he consented to read a renunciation of the crown before a deputation of prelates, barons, knights, and lawyers, and to declare that, if he had the right of naming his successor, the man he would fix upon should be his cousin of Lancaster. Such at least is the account inserted by Henry's order in the rolls of parliament. On the next day the two houses of parliament met together in Westminster Hall, and voted his deposition, immediately after which the Duke of Lancaster rose and claimed the crown, and was unanimously recognised as king. [HENRY IV.]

Richard did not long survive his dethronement. On the 23rd of October the house of peers, in a new parliament, on being consulted, by King Henry's order, as to what should be done with him, recommended that he should be closely confined in some castle, the knowledge of which should be kept secret from the people; and in conformity with their advice, he was a few days after privately conveyed away from London. All that is further known is, that in the following February rumours were everywhere spread that he was dead, and that in the beginning of March his body, or what was declared to be such, was brought with funeral pomp from Pontefract Castle to London, and there exhibited openly to the people. Afterwards it was reported, by some that he had starved himself to death, by others that he had been starved by his keepers, according to a third version of the story, that he had been violently made away with by Sir Piers Exton, assisted by seven other assassins. For many years also rumours continued to arise from time to time that he had made his escape, and was still alive in Scotland; and an attempt has recently been made to establish the probability of this strange story; but the supposed new evidence brought forward in support of it has been satisfactorily shown to be quite inconclusive.

Of the alterations made in the statute law during the reign of Richard II., the most important was the extension of the former Acts against provisors, or persons obtaining papal presentations to benefices before they were vacant, by a series of new Acts, and especially by the 16 Ric. II., c. 5, commonly called the Statute of *Præmunire*.

In 1382 a statute was passed for apprehending and punishing the followers of the religious reformer Wycliffe, who are described as malevolent persons going about from country to country, and from town to town, in peculiar habits, with pretence of great sanctity, and without licence of the pope or the ordinary, preaching daily in the churches, churchyards, markets, fairs, and other open places where the people were assembled in greatest numbers, discourses full of heresies and notorious errors, to the great injury of the faith, and destruction of the laws and estate of holy church, &c. But this Act was repealed the same year, on the representation of the Commons that it had been passed without their assent. Just before its enactment twenty-four opinions, attributed to Wycliffe, had been condemned as heretical and dangerous by a synod of churchmen; the reformer appealed against the decree, but was ultimately induced to submit, and he remained in quiet at his rectory of Lutterworth, till his death, about two years after. His opinions however had already made great progress among the people; and the spirit which he had awakened by his preaching and writings continued to live and spread after his death, and no doubt materially contributed to prepare the way for the overthrow of the old religion, which was effected a hundred and fifty years later.

In the preceding year (1381), after the suppression of Tyler's rebellion, the offence of treason was extended to the act of beginning a riot, rout, or rumour, by the 5 Ric. II., st. i. c. 7; but this severe enactment was repealed in the reign of Edward VI. This is one of the ancient statutes constituting the offence called '*Scandalum Magna-*

turn.' To the reign of Richard II. have been assigned the complete establishment of the court of the high admiral, and the enlargement of the jurisdiction of the Court of Chancery by the first issuing of subpoena. Finally, the right of impeachment and prosecution by the Commons in parliament, which had been first asserted in the latter years of Edward III., was finally established in this reign by the impeachment of the Earl of Suffolk, the late chancellor, in 1386.

Richard II. had no issue by either of his wives (his second indeed was only a child of ten years of age at the time of his death); nor are any natural children assigned to him by the genealogists. Queen Isabel returned to France in 1401, and became the wife of her cousin Charles, duke of Orleans, after bearing a daughter to whom, she died, at the age of twenty, in 1409.

RICHARD III., king of England, was the youngest son of Richard, duke of York, whose descent is given in the article on EDWARD IV. Richard was born on the 2nd of October, 1452, at Fotheringay Castle in Northamptonshire. On the defeat and death of the Duke of York at Wakefield Green, 31st December 1460, where the duke's second surviving son Edmund, styled earl of Rutland, was also killed, Richard and his elder brother George, afterwards duke of Clarence, were sent by their mother to Utrecht, where they remained under the protection of Philip, duke of Burgundy, till the crown of England was acquired (about two months after) by their eldest brother Edward. Soon after this event Richard was created duke of Gloucester, made a knight of the Garter, and appointed to the office of lord high admiral, though as yet only in his tenth year. In 1469 he was made one of the wardens of the Scottish marches: in 1470 he fled with the king, his brother, to Flanders on the sudden restoration of Henry VI. by the Earl of Warwick: in 1471 he commanded the foreward of his brother's army at the battle of Barnet; and he also assisted in gaining for Edward his next and crowning victory of Tewksbury. He and his brother Clarence are asserted to have been the actual murderers of Henry's son Prince Edward, after the battle. [EDWARD IV.] To Gloucester also was popularly ascribed at the time the murder of Henry himself in the Tower a few weeks after. [HENRY VI.] The following year the Lady Anne Nevil, daughter of the Earl of Warwick, and widow of Prince Edward, was prevailed upon to give him her hand.

In 1478 Gloucester took a foremost part in the attainder and destruction of his brother Clarence, whose removal placed him next after the king's issue in order of succession to the throne. In 1482 he commanded an expedition against Scotland, in the course of which he took the town of Berwick and penetrated as far as Edinburgh. He had only recently returned from this expedition, and was still in command of his army on the borders, when the death of his brother took place, in the beginning of April, 1483.

On the receipt of this intelligence, Richard immediately prepared to set out to London, stopping however on his way at York, where he summoned the gentlemen of the county to swear allegiance to Edward V., taking the oath first himself. At Northampton he was met on the 29th of April by the Duke of Buckingham, and it is believed that the measures, probably in part arranged previously by letter, were then finally concerted, by which Richard should be elevated to the throne. On the next day Edward's uncle, Earl Rivers, and his half brother, Lord Grey, who were at Stony Stratford with the king, were both arrested by Gloucester's orders; and possession was also taken of the royal person.

From his arrival in London to the disappearance of the young king and his brother towards the end of June [EDWARD V.], Gloucester, who now called himself Lord Protector, kept his residence at Crosby Place in the City, where he held frequent conferences with his confidants. On the 13th of June, Lord Hastings was arrested by his orders in the council-room at the Tower, and immediately led to execution; and two days after, the Lord Grey, Sir Thomas Vaughan, and Sir Richard Hawes underwent the same fate before the gate of Pontefract Castle. The public were informed by proclamation that these persons had been put to death as having, with the queen and her adherents, 'intended to murder and destroy the Protector and his cousin the Duke of Buckingham, and the old royal blood of the realm.' Lord Stanley, the Archbishop of York, and the Bishop of Ely were also arrested.

On Sunday the 22nd of June Dr. Shaw preached his famous sermon at Paul's Cross, in which he denounced both the present and the late king as bastards; and on the Tuesday following the Duke of Buckingham harangued the citizens to the same effect from the hustings in Guildhall. The next day, Buckingham, accompanied by other lords, by Shaw the lord mayor (brother of the preacher), and by a number of other citizens, proceeded to Baynard's Castle, the residence of the Duchess of York, where Richard then was, and in a long address offered him the crown and royal dignity in the name of the three estates of the land. Richard, with some affected hesitation, replied that he felt it to be his duty to obey the voice of the people, and that he would from that day take upon himself the royal estate of the two noble realms of England and France. On the following day, the 26th, he proceeded to Westminster Hall, and there formally declared himself king. The commencement of his reign is counted from that day, though he was not crowned till the 6th of July.

Whether it was the fear inspired by the known determination and

unscrupulousness of Richard's character, and the executions at London and Pontefract, that operated upon the public mind, or that any considerable part of the nation really preferred his claims to those of his nephew and the rest of his late brother's children, it must be admitted that his accession, so far from having been opposed in the first instance from any quarter, appears to have been everywhere hailed with all the evidences of popular approbation and rejoicing. Part of this favour, if it was not a mere show, he may have owed to the clemency and condescension which he affected as soon as he found himself fairly seated on the throne, and to the expectations of a mild or lax government which the very doubtfulness of his title would excite. But the story, in truth, has been so imperfectly transmitted to us, that it is difficult to weave any consistent or satisfactory theory out of the unconnected details that have been preserved. All we know is, that Richard, having immediately after his coronation set out with his queen on a tour through the northern parts of the kingdom, and having been everywhere received with apparently the most cordial gratulations by all classes, was suddenly surprised, while sojourning at York, by intelligence of a formidable confederacy which had been formed against him by the friends of his two nephews in the southern and south-western counties, with his own chief adviser the Duke of Buckingham at its head. It appears that a rising would have taken place immediately throughout Kent, Essex, Sussex, Berkshire, Hampshire, Wiltshire, and Devonshire, had it not been prevented for the moment by its being ascertained that the two royal children were dead. This intelligence however only changed the plan of the conspirators. By the advice of the Bishop of Ely, the crown was offered to Henry, earl of Richmond, on condition that he should marry Edward IV.'s daughter the Princess Elizabeth; and as soon as his acceptance of the proposal was received from beyond seas, his partisans called their followers to arms on the same day, the 18th of October, in all the parts of the country where they had influence. But this insurrection was quelled almost as soon as it broke out. Richmond, after having reached the coast of Devon, did not venture to disembark; Buckingham was deserted by a force of Welshmen that he had raised at Brecknock, and, falling into the king's hands, had his head immediately struck off in the market-place of Salisbury; of his associates the most fortunate escaped beyond seas; and by the end of the month not an enemy of Richard's remained in arms in England.

A parliament was now summoned, which, having met on the 23rd of January 1484, immediately passed an Act declaring Richard to be undoubted king of the realm of England "as well by right of consanguinity and inheritance, as by lawful election, consecration, and coronation," and bastardising the issue of the late King Edward IV. by Elizabeth Rivers, whom it designated as the late wife of Sir John Gray, and denied to have any rightful title to the dignity of queen-dowager. This Act is known by the name of the 'Titulus Regius,' and is the earliest of what are called the Private Acts, none of which are given in any of the printed collections of the statutes. The 'Titulus Regius,' however has been printed by Sir Robert Cotton, in his 'Abridgment of the Rolls of Parliament.' This Act was followed by others (also classed as private Acts), attainting and confiscating the property of all the principal persons engaged in the late revolt. But various acts of public utility were also passed by this parliament; among others, one authorising every justice of the peace to admit a prisoner to bail, and directing that no officer should seize the goods of a prisoner till after his conviction; one regulating the impannelling of juries; one declaring and amending the law respecting the levying of fines; and several relating to commercial affairs, which, if they were not in all points grounded on the most enlightened principles, were at least in accordance with the opinions of the time, and must be regarded as evidences of a considerable interest taken by this parliament in the economical welfare of the country.

Soon after this however Richard deemed it expedient to adopt a new policy. The queen-dowager, whom the parliament had just declared to have been only the late king's mistress, he now, in alarm at the projected alliance between her eldest daughter and the Earl of Richmond, affected to court as his near and honoured kinswoman; he proposed marrying the Princess Elizabeth to his own son Edward; and when that prince died (in April 1484), and his queen, Anne, who had borne him no other children, soon after fell sick, he offered to marry Elizabeth himself. And strange as it appears, both mother and daughter went eagerly into this scheme; the princess in particular showed the utmost impatience for the marriage with her uncle, at least this is the statement made by Sir George Buck, who asserts that he saw a letter written by her to the Duke of Norfolk, protesting that the king was "her joy and maker in this world, and that she was his in heart and thought," and fretfully expressing her fears that Queen Anne "would never die." But when Anne at last did die (on the 16th of March 1485), not without suspicion of poison, his two confidants, Radcliffe and Catesby, succeeded in dissuading Richard from venturing upon this incestuous marriage, which they assured him would excite the popular indignation from one end of the kingdom to the other; and he then took great pains to proclaim that nothing of the kind had ever been contemplated.

He had the preceding year disembarassed himself of one considerable source of annoyance and distraction by concluding a peace with Scotland for three years; and affiancing his niece, the lady Anne de la Pole,

daughter of his sister the Duchess of Suffolk, to James III.'s eldest son, the Duke of Rothsay, afterwards James IV. (a transaction however which did not issue in an actual marriage). But at home the aspect of things was now becoming more unsatisfactory every hour. He durst not venture in the state of the public mind to call a parliament, and he found himself at once without money and nearly without an adherent upon whose fidelity he could depend. One after another of the most eminent of those who had hitherto stood by him fled to France to join the Earl of Richmond. At last, on the 7th of August Henry landed at Milford Haven; and on the 21st of the same month the result of the battle of Bosworth deprived Richard at once of his crown and his life. [HENRY VII.]

Richard left at least one natural son, known by the name of John of Gloucester, who, although yet a minor at his father's death, had been already appointed governor of Calais. There is also a romantic story told of a Richard Plantagenet, who died in the parish of Eastwell in Kent, in 1550, an old man of eighty-two, after a life spent as a working bricklayer, and who asserted that he was present at Bosworth Field, where Richard informed him he was his son; but this legend rests on the slightest authority. A natural daughter, named Katherine, is assigned to Richard, who was to have been married to the Earl of Huntingdon, but who died in 1484, before she had reached the age agreed upon. The Duchess of York, the mother of Edward IV. and Richard III., we may here notice, survived all these events, not dying till 1495.

Both the character of Richard III. and many of the events of his reign have been subjects of dispute among modern writers, some of whom have gone the length of attempting to make out that all the crimes imputed to him are the mere fabrications of his enemies. Much to this effect that Horace Walpole has advanced in his famous 'Historic Doubts,' and later writers have repeated, had been anticipated by Sir George Buck, in his 'Life and Reign of Richard III.,' published so long ago as the middle of the 17th century. Buck's work however also contains a considerable quantity of matter not elsewhere preserved, at least in a printed form. The chief original historian of this reign is Sir Thomas More, in his unfinished tract, entitled 'A History of the Pitiful Life and Unfortunate Death of Edward V. and the Duke of York his brother; with the Troublesome and Tyrannical Government of the Usurpation of Richard III., and his miserable End.' There are the Latin annalists, John Rouss, or Rosse, and the continuator of the 'History of Croyland.'

RICHARD PLANTAGENET, Earl of Cornwall, and titular King of the Romans and Emperor of Germany, was the second son of John, king of England, and was born January 5, 1208. He was created Earl of Cornwall by his brother Henry III. in 1226; and he figures as one of the leading personages throughout that turbulent and distracted reign, showing generally much moderation and good sense in his endeavours to assuage the contentions between the king and the barons, with whom he occasionally sided against the more outrageous excesses of the royal authority, although, as might be expected, without any participation in the design of abridging the ancient prerogatives of the crown, and not without a natural regard in other respects to the interests created by his position. Although he showed some military talent on more than one occasion, his abilities on the whole seem to have been, like his politics, moderate, and of a middle character; he had no pretensions to a brilliant or commanding intellect, but he was at least as far removed from the weak-mindedness of the king his brother, generally evincing in his public conduct at least good sense and discretion, as well as a calm and conciliatory temper. It was a consequence of this moral and intellectual constitution however that, if he had no great vices, he should also be without great virtues; and that the reigning principle of his character should be a cold selfishness, which, though it might shrink from any course of violent aggression upon the rights of others, would yet be active in seeking all safe advantages; and, in that pursuit, would be in danger of sometimes tripping or overreaching itself, notwithstanding all its clear-sightedness and habitual caution. Richard, moreover, if he had no lofty or daring ambition, seems to have had a considerable share of vanity, which also would be apt to assist in betraying him in certain circumstances. If we take these considerations along with us, it will be easy to understand his career. After having first joined the barons who attempted to check the royal despotism, and afterwards more than once interposed successfully as a mediator between them and the king, we find him entirely separating himself from their latter and more decided proceedings; and, in the final struggle with De Montfort and his associates, which put in jeopardy even the possession of the crown by his family, resisting the insurgents as keenly as Prince Edward himself. The most remarkable incident however of Richard's history is his election as King of the Romans in 1256. This honour he is believed to have owed entirely to his great wealth, which enabled him to bribe several of the electors; but it is matter of dispute whether, after all, the majority of votes was really given to him, or, at another election a few weeks after, to his competitor, Alphonso, king of Castile. Richard is commonly reckoned among the German emperors next after William, count of Holland, the successor of Conrad IV.; but some historians distinguish the whole period from the death of Conrad in 1254, to the accession of Rodolph I. in 1273, by the name of the Grand Interregnum. Richard was crowned at Aix-la-Chapelle, and occasionally exercised

such of the imperial rights as could be exercised by a stroke of the pen or the expenditure of a little sealing-wax; but he never enjoyed any real authority in Germany, nor indeed did he show himself much in that country. He was taken prisoner by De Montfort, along with the king his brother, at the battle of Lewes, in May 1264, and was confined in Kenilworth Castle for more than a year. He died in his house at Berkhamstead, on the 2nd of April 1272.

Richard was thrice married: first, in 1230, to Isabel, daughter of the great Earl of Pembroke, and widow of the Earl of Gloucester, who died in 1240; secondly, in 1243, to Sanchia of Provence, a sister of his brother's wife, Queen Eleanor, who died in 1261; thirdly, in 1267, to a German lady, Beatrice, daughter of Theodorich de Falkmoute, and niece of Conrad, archbishop of Cologne, who survived him. Of five children which he had by his first wife, and two by his second, all died without issue. His second, and then eldest, son Henry, was assassinated in the church of St. Lawrence at Viterbo in Italy, by Simon and Guy, the two sons of De Montfort, on the 3rd of March 1271. The earls of Berkeley claim to be descended from a natural daughter of Richard, earl of Cornwall, Isabel, who married Maurice de Berkeley, the father of the first Baron Berkeley.

RICHARD DE BURY was born in 1287, upon the estate of his father, Sir Richard Angerville, or in Bury St. Edmunds; but it is probable that the predilection which occasioned his taking the name of that place arose from his having received the first rudiments of scholastic education there from his uncle, John de Willoughby, a clergyman. When sufficiently qualified he was sent to Oxford, where he continued to study till he received the appointment of tutor to Prince Edward (afterwards Edward III.), with the office of receiver of his revenues in Wales. This situation enabled him to afford assistance to his royal pupil in the hour of adversity, for when Edward fled with his mother to Paris, and was distressed for want of money, De Bury secretly hastened to succour him, taking with him a large sum in gold, which he had collected while in office; but his flight being discovered, he was pursued by the king's lieutenant, with a band of twenty-four horsemen, even to Paris, where he narrowly escaped detection by being concealed during seven days in the belfry of the convent of Friars Minors. When Edward came to the throne the fidelity of his tutor was rewarded by a rapid advancement to dignities both in church and state. He was first made cofferer to the king, then treasurer of the wardrobe and clerk of the privy seal; he also visited Rome twice as legate to Pope John XXII., and on both occasions was treated with great honour and distinction, being made one of the pope's principal chaplains, and presented with a bull nominating him to the first see that should become vacant in England. He made himself remarkable on his second journey by the splendour of his retinue: when he went into the presence of the pope and his cardinals he was uniformly attended by twenty-six clerks and thirty-six esquires, all attired in the most sumptuous manner. His expenses for the journey amounted to 500 marks. Whence the means were derived may be seen in the list of his appointments, which, besides the above-named, were, during the first six years of Edward's reign, two rectories, six prebendal stalls, the archdeaconries of Salisbury and Northampton, the canonry of Weston, and the deanery of Wells.

While at Paris, on his return from Rome, he received intelligence that the bishopric of Durham was vacant, and that the king had written to the pope requesting his presentation to that see. It happened that the right of election was vested in the prior and chapter of Durham, who, notwithstanding they had also a letter from the king, proceeded to elect Robert de Graystones, a monk and subprior of Durham, who was confirmed and consecrated by the Archbishop of York, as Bishop Godwin says, with more haste than good speed, for the temporalities were at the king's disposal, and he withheld them till he received the pope's answer, which happened to be dated one day prior to the election of Graystones, and confirmatory of the appointment of De Bury. Upon this Graystones was deposed, and De Bury consecrated by the Archbishop of Canterbury, on the 19th of December 1333.

The ready submission to this infringement of the right of appointment by all the parties concerned, has been severely remarked upon by those who were not interested in it. In 1334 De Bury was made chancellor and high treasurer of England. Within the three following years he was thrice at Paris as ambassador to the king of France upon the subject of Edward's claim to the crown of that kingdom, and in the same character he visited Antwerp and Brabant. He had been installed at Durham by proxy, and had once visited the see, but in 1337 he did homage to the Archbishop of York. It does not appear when he resigned any of his political appointments, but he probably did not pass much of his time in his diocese till after 1338. When he had leisure, we find him deeply involved in pursuits far more congenial to his taste and suitable to his sacred office than politics. Accident made him a statesman, but he was a scholar from habit and natural inclination. In early youth he delighted in the society of learned men, but of books "in which wisdom is contained" he was an enthusiastic lover and the most distinguished collector of his age. Fortunately for him the king encouraged this disposition, and allowed him to use the influence of office in the promotion of his views. He purchased freely in his travels and at home, where he made himself acquainted with every collection, public and private. Moreover, he says, when it became commonly reported that books, especially old

ones, were more precious in his estimation than money, or such new-year's gifts and other presents as it was customary to make in his time, they flowed in abundantly from all quarters. His researches saved many books that would have perished from neglect, and these he caused to be repaired. Such as he could borrow, if they were not for sale, he caused to be copied, for which purpose he had an establishment of bookbinders, stationers, and illuminators in his palace. It is said that he finally became possessed of more books than all the other bishops of England put together; but it is just to state that his exertions were intended for the public good, and not merely for the gratification of a taste by no means unbecoming, though it was remarked upon as almost peculiar to himself at the time. In a sketch of his will, made shortly before his death, he says he bequeaths all his books to a company of scholars, residing in a hall at Oxford, as a perpetual alms-deed for his own soul and for the souls of his parents, and of King Edward and his consort. The books went to Oxford, but Bishop Godwin could not find that he made a foundation there, as it has been stated. The hall in which they were deposited was on the site upon which his successor Hatfield founded Durham (now Trinity) College.

De Bury was not only a learned man, but a liberal patron of learning. He regretted the general ignorance of the Greek and Hebrew languages, and took care to provide grammars of both. In searching for elementary books generally, even the village schools did not escape his scrutiny. There is no doubt that De Bury was acquainted with Greek, and he probably learned it at Oxford. Grosseteste, who died in 1258, learned Greek and Hebrew at Oxford, from which it appears that these languages were taught there before De Bury's time. That Greek was taught in England still earlier than Grosseteste's time is also certain. [ROBERT OF LINCOLN.]

The best account of his researches and of his life will be found in the 'Philobiblon,' a small treatise written for the purpose of explaining his objects, of giving directions about books generally, and particularly about his own collections, and even of justifying his conduct, for there were many who derided his pursuits, and thought them altogether extravagant. This tract was first printed at Cologne in 1473; afterwards at Spire in 1483; Paris, 1500; Oxford, 1599; and in the collections of Goldast and Schmid: a limited impression of an English translation (by Mr. J. B. Inglis) was published by Rodd in 1832. There is no other known work by him extant, though one is mentioned under the title of 'Orationes ad Principes,' and some letters are spoken of. He certainly had an extensive correspondence with the most distinguished literary men of his time. Petrarca, with whom he conversed, calls him a man of an ardent and enthusiastic turn. He bears an excellent character generally; his wealth was freely bestowed upon the deserving but needy scholar, and he was equally munificent in distributing alms to the poor. His book evinces a benevolent disposition, though we must except against his refusing the use of books to the laity, but his precautions against the abuse of them are worthy of all commendation. He died at Auckland on the 14th of April 1345, aged fifty-eight, and was buried with due honours in the southern angle of the cathedral of Durham.

RICHARD OF CIRENCESTER, or 'Ricardus Corinensis' (sometimes called the Monk of Westminster), a monkish historian of the 14th century, so named from his being a native of Cirencester in Gloucestershire. No traces of his family or connections have been discovered, nor has the exact time of his birth been ascertained, although the superior education which he received has led to the supposition that his family was of the higher ranks. He entered the Benedictine monastery of St. Peter, Westminster, in 1350: his name occurs in various documents in 1387, 1397, 1399, and he is registered in one of the chamberlain's lists preserved among the abbey records, by the name of Cirestre. He composed several elaborate works on Saxon and British history, and to increase his knowledge he visited most of the libraries in this country for reference to original manuscripts. He obtained a license to visit Rome from his abbot in 1391, the original of which is still in existence. It is supposed that he undertook this journey between 1391 and 1397, for he appears to have been confined in the abbey infirmary in 1401, and to have died in that or the following year. His work entitled 'Historia ab Hengista ad ann. 1348,' is in two parts. The first part is from the arrival of the Saxons to the death of Harold. His theological works were 'Tractatus super Symbolum Majus et Minus,' and 'Liber de Officiis Ecclesiasticis.' But he is chiefly known from his celebrated treatise entitled 'De Situ Britanniae,' which was first discovered in manuscript in 1747 by Charles Julius Bertram, professor of the English language at the Royal Marine Academy at Copenhagen, who sent a transcript of the whole to Dr. Stukeley, with a fac-simile of the manuscript. In 1757 Dr. Stukeley published an analysis of the work, with the 'Itinerary;' and other particulars may be seen in the second volume of Dr. Stukeley's 'Itinerarium Curiosum,' and in Whitaker's 'Manchester.' In the same year the treatise was published at Copenhagen by Professor Bertram, with the remains of Gildas and Nennius, under the title 'Britannicarum Gentium Historiæ Antiquæ scriptores tres Ricardus Corinensis, Gildas Badonicus, Nennius Banchorensis,' &c., 8vo, but this work became scarce. In 1809 an edition was published in London, entitled 'The Description of Britain, translated from Ricardus of Cirencester, with the original treatise De Situ Britanniae,

with the map and a fac-simile of the manuscript, as well as a commentary on the Itinerary.' It was also reprinted as one of 'Six Old English Chronicles,' in a volume of Bohn's 'Antiquarian Library,' 1848. The discovery of this treatise was regarded as an era in the study of British and Roman-British antiquities. The Itinerary contains eighteen journeys which Richard says he compiled from certain fragments written by a Roman general and from Ptolemy and other authors; he mentions a hundred and seventy-six stations (while Antoninus has only 113), some of them a considerable distance north of the wall of Severus, besides which there are numerous chasms which show that many names have been lost or obliterated. The credit and fidelity of this work have been attacked, but they have been defended by a reference to local investigation the result of which has in many instances been favourable to the authenticity of the work. On the other hand it is often extremely incorrect, and the account which Bertram gives of the manuscript, which he says "came into his hands in a very extraordinary manner with many other curiosities," is far from satisfactory. What has become of "the original manuscript" from which he professes to have made the copy he sent to Stukeley does not appear to be known: it is not in the Royal Library at Copenhagen where it was expected to be found. Many good scholars and antiquaries however still believe the work to be authentic, but the tendency of opinion is decidedly the other way. Gibbon says of Richard that "he shows a genuine knowledge of antiquity very extraordinary for a monk of the 14th century." He is frequently quoted by his Latin name Ric. Corin., i.e. Ricardus Corinensis.

\* RICHARDSON, DR. CHARLES, was born in July 1775. He was intended for the profession of the law, and his early education was adopted for that pursuit. He however did not long follow it, but turned his attention to literature, and especially to philology. In 1805 he issued his first production, 'Illustrations of English Philology,' in which he supported the principles advocated by Horne Tooke and which contained criticisms on Dr. Johnson's Dictionary, with observations on Dugald Stewart's essay 'On the Tendency of some late Philological Speculations.' Subsequently he undertook to furnish the lexicographical portion of the 'Encyclopædia Britannica,' the first part of which was published in January 1818, but after the issue of the fourth part, the work was suspended through the failure of the publishers, until it was resumed by Mr. Mawman. In 1835, the publisher being the late Mr. Pickering, the 'Dictionary' as a separate work first began to be issued, and it was completed in 1837. It is undoubtedly the best dictionary we have, it remedied many of the defects of Johnson, as the author had a far more extended acquaintance with foreign languages. It was deservedly successful, and other editions both in 4to and as an abridgment in 8vo have been since issued. Mr. Pickering's failure however, who possessed a share of the copyright, occasioned difficulties which were at length overcome by the copyright becoming vested in the hands of the author, Mr. Whittingham of the Chiswick press, and Mr. George Bell. Dr. Richardson has also published an essay 'on the Study of Languages,' an exposition of the principles which guided him in the composition of the dictionary, founded on those of Horne Tooke in the 'Diversions of Purley.' He has also contributed some interesting papers on subjects connected with philology to the 'Gentleman's Magazine,' and has produced some useful and ingenious remarks on passages of Shakspeare.

\* RICHARDSON, SIR JOHN, KNIGHT, M.D., was born in 1787, at Dumfries, in Scotland. His father, Gabriel Richardson, was a magistrate of the county of Dumfries, and provost of the town. John Richardson received his early education at the grammar-school of Dumfries. In 1801 he entered the University of Edinburgh, where he studied chiefly with a view to the medical profession. He entered the navy in 1807 as an assistant-surgeon. He served at the siege of Copenhagen, and afterwards on the coasts of Spain and Portugal, and was promoted to be acting-surgeon of the Hercules, 74 guns. In 1816 he took his degree of M.D. at the University of Edinburgh, and in 1818 married his first wife, a daughter of William Stiven, Esq., of Leith. In 1819 Dr. Richardson accompanied Captain Franklin as surgeon and naturalist on his first expedition to the shores of the Arctic Sea. Their labours, sufferings, and privations, have been alluded to in the memoir of FRANKLIN, REAR-ADMIRAL SIR JOHN. That expedition was not completed till 1822, and Captain Franklin's 'Narrative of a Journey to the Shores of the Polar Sea in 1819 to 1822,' was published in 1823. In 1825 Captain Franklin undertook the command of a second expedition to the shores of the Arctic Sea, and Dr. Richardson again accompanied him as medical officer and naturalist. They arrived in safety at Great Bear Lake, and passed the winter of 1825-26 at Fort Franklin, which they constructed for that purpose. Having descended the Mackenzie River to the spot where it separates into two main branches, the expedition was formed into two detachments. Captain Franklin and Lieutenant Back, having the command of two boats, descended the western branch of that river, at the same time that Dr. Richardson and Mr. Kendall, also with two boats, descended the eastern branch. Captain Franklin, with his detachment, traced the shores of the Arctic Sea from the Mackenzie River westwards to nearly 149° W. long., while Dr. Richardson, with the other detachment, traced the coast eastwards to the mouth of the Coppermine River. Dr. Richardson and his party then ascended the Coppermine River in their boats eleven

miles to Bloody Fall, from which point the river ceases to be navigable upwards, owing to the large number of shoals and rapids. Leaving their boats, they then travelled on foot along the banks of the river and across the country till they joined Captain Franklin and his party, who had returned to Fort Franklin on Great Bear Lake. Captain Franklin and Dr. Richardson arrived in London on the 29th of September 1827. In 1828 was published a 'Narrative of the Second Expedition to the Shores of the Polar Sea in the Years 1825, 1826, and 1827, by John Franklin, Captain R.N., F.R.S., &c., and Commander of the Expedition; including an Account of the Progress of a Detachment to the Eastward, by John Richardson, M.D., F.R.S., F.L.S., &c., Surgeon and Naturalist to the Expedition; illustrated with numerous Plates and Maps,' 4to.

In 1829 Dr. Richardson published the First Part of the 'Fauna Boreali-Americana, or the Zoology of the Northern Parts of British America, containing Descriptions of the Objects of Natural History collected on the late Northern Land Expeditions under the Command of Sir John Franklin; by John Richardson, M.D., F.R.S., &c., assisted by William Swainson, Esq., F.R.S., &c., and the Rev. William Kirby, M.A., F.R.S., &c.' 4to. Part II., 'The Birds,' by Swainson and Richardson, was published in 1831. Part III., 'The Fishes,' by Richardson, in 1836; and Part IV., 'The Insects,' in 1837.

Dr. Richardson's first wife died in 1831, and in 1833 he married a second, who was the only daughter of John Booth, Esq., of Stickney. In 1838 he was appointed Physician to the Fleet, and went to reside at the Royal Naval Hospital at Haslar, near Gosport. In 1840 he was appointed an Inspector of Hospitals. His second wife died in 1845; he was created a Knight in 1846; and in 1847 he married a third wife, the youngest daughter of Archibald Fletcher, Esq., of Edinburgh.

Sir John Franklin, who had left England in May 1845, with the ships *Erebus* and *Terror*, on his last expedition to the Arctic Seas, not having been heard of at the end of the autumn of 1847, the British government resolved to send out three distinct searching expeditions—one to Lancaster Sound, under Sir James Clarke Ross; another down Mackenzie River, under Sir John Richardson; and a third to Behring's Straits, under Captain Kellett.

The main object of the expedition under Sir John Richardson was to search the coast between the mouths of the Mackenzie River and the Coppermine River, and the shores of Victoria Land and Wollaston Land lying opposite to Cape Krusenstern. Dr. Richardson, accompanied by Mr. Rae, left Liverpool by steamer on the 25th of March 1848. On the 18th of April they were at Montreal, on which day the steamers commenced running on the river St. Lawrence. They embarked on the following day; and, passing across the Canadian lakes in steamers, afterwards travelled with canoes along the northern series of lakes and rivers to the Great Slave Lake, where boats and all necessary stores having been provided, they commenced the descent of the Mackenzie River on the 24th of July 1848, and reached the sea on the 6th of August. Having traced and examined the shores as far as Cape Krusenstern, they advanced to Cape Kendall, but were prevented by the ice from reaching the mouth of the Coppermine River. They were consequently obliged to leave their boats, and travel overland till they reached Fort Confidence, on Dease River, where log-houses had been constructed for their use, and where they passed the winter of 1848-49. In the summer of 1849 Mr. Rae attempted to reach Wollaston Land in a boat, but the quantity of ice and stormy state of the weather rendered all his efforts unavailing. The party then proceeded to Great Bear Lake, and afterwards to Great Slave Lake, whence they returned by their former route, and arrived safely in Canada. Sir John Richardson left Montreal in October, and landed at Liverpool on the 6th of November 1849. In 1851 he published the 'Arctic Searching Expedition: a Journal of a Boat-Voyage through Rupert's Land and the Arctic Sea, in Search of the Discovery-Ships under command of Sir John Franklin; with an Appendix on the Physical Geography of North America; by Sir John Richardson, C.B., F.R.S., Inspector of Naval Hospitals and Fleets,' &c., 2 vols. 8vo. This work, besides the journal of the progress of the expedition, contains a very large amount of information on the geology, geography, and natural history of the northern part of the American continent, as well as concerning the various tribes of Indians and Esquimaux who inhabit it. Sir John Richardson retired from service as a naval medical officer in 1855.

Sir John Richardson, as part of his official duty, had the superintendence of the museum established at Haslar Hospital through the exertions of Sir William Burnett, inspector-general. Many specimens of rare fishes were deposited there, and in 1842 he published in 4to the first part of 'Icones Piscium, or Plates of Rare Fishes.' The work however was discontinued.

Sir John Richardson has contributed to the natural history of the following voyages:—The *Mammalia*, to 'The Zoology of Captain Beechey's Voyage to the Pacific and Behring's Straits, in H.M.S. *Blossom*,' 4to, 1839; 'The Fishes,' to 'The Zoology of the Voyage of H.M.S. *Erebus* and *Terror*, under the command of Sir James Clarke Ross, during the years 1839 and 1843,' 4to, 1845; 'The Fishes,' to 'The Zoology of the Voyage of H.M.S. *Samarang*, under the command of Captain Sir Edward Belcher, during the years 1843-46,' 4to, 1848; 'Fossil Mammals,' to 'The Zoology of the Voyage of H.M.S. *Herald*, under the command of Captain Henry Kellett, R.N., C.B.,

during the years 1845-51, 4to, 1852; 'Notes on the Natural History,' to 'The Last of the Arctic Voyages, being a Narrative of the Expedition of H.M.S. *Assistance*, under the command of Captain Sir Edward Belcher, C.B., in Search of Sir John Franklin, during the years 1852-53-54,' 2 vols. 8vo, 1855.

RICHARDSON, JONATHAN, a portrait-painter, was born about 1665. His father dying when he was only five years old, his mother's second husband apprenticed him to a scrivener; but as his master died in the sixth year of his clerkship, he followed the bent of his inclination, and at the age of twenty became a pupil of John Riley. After leaving this instructor, with whom he studied four years, and whose niece he married, Richardson commenced the practice of portrait-painting, in which, even during the lives of Kneller and Dahl, he obtained great employment, and upon their decease he was considered as the head of his profession in England. The profits of his business enabled him to retire from practice many years before his death, which happened suddenly at his house in Queen-square, Westminster, on the 28th of May, 1745. Hudson, the preceptor of Sir Joshua Reynolds, was his pupil and son-in-law. As an artist, Richardson was one of the best painters of a head that this country had at that time produced, but there his merit ended. He had strength, roundness, and boldness in his colouring; but his attitudes, draperies, and backgrounds are insipid and unmeaning, and the disposition of his subjects shows that he was wholly devoid of imagination. There are a few etchings of portraits by his hand, among which are his own, prefixed to his work on Criticism; John Milton; Alexander Pope (two plates, one of them a profile); and Dr. Mead.

It is however as a writer on art that the fame of Richardson must depend. In 1719 he published two discourses, entitled 'An Essay on the whole Art of Criticism as it relates to Painting, and an Argument in behalf of the Science of a Connoisseur,' in 1 vol. 8vo. This work contains the rules of painting and of pictorial criticism laid down with judgment and precision, and expressed in language both forcible and just. In it he shows a just appreciation of the excellences of Raffaele, and makes many admirable remarks upon the various styles of this great painter—his Perugino, his Florentine, and his Roman manner. He also refers with pride to our national treasures at Hampton Court—the Cartoons of Raffaele—and pronounces as to them and 'The Transfiguration' that as they were the last, so they are the best productions of his hand. The Essay and Argument with 'The Theory of Painting,' by Richardson, were published together in an octavo volume by his son in 1773. This latter composition also contains an able criticism on the style of Raffaele, acute observations on the Cartoons, and some valuable notices of the paintings by him in the Vatican: they were unquestionably the best original critical essays on painting which had appeared in the English language. In 1722, in conjunction with his son, he published 'An Account of some of the Statues, Bas-Reliefs, Drawings, and Pictures in Italy, &c., with Remarks by Mr. Richardson, sen. and jun.,' and in 1734 they published together 'Explanatory Notes and Remarks on Milton's 'Paradise Lost,' with a Life of the Author and a Discourse on the Poem.' In 1776 the son published a volume of poems by his father, but they possess very little literary merit.

RICHARDSON, SAMUEL, the inventor of the modern English novel, was born in Derbyshire in 1689. His father had been a joiner in London, but had retired to the country, and fixed himself at Shrewsbury, after the execution of the Duke of Monmouth, with whom it appears he had been in some way or other connected. It is stated that both his father and mother had been born in a superior station to that in which they had come to move. At one time the joiner hoped to have been able to educate his son for the church; but a decline in his circumstances forced him to forego this ambition, and young Richardson was in his seventeenth year bound apprentice to Mr. John Wilde, a printer of London, after having had merely the education in reading and writing to be obtained at a common village school. He has informed us however, that long before this the peculiar talents which he afterwards displayed in his novels had begun to show themselves. He was noted while at school, he relates, for his flow of invention; his schoolfellows used to make him tell them stories, and were always most pleased with those he made out of his own head. "All my stories," he characteristically adds, "carried with them, I am bold to say, a useful model." But already, as throughout his life, his most delighted listeners, and the associates who best drew forth his powers, were of the other sex. "As a bashful and not forward boy," he says, "I was an early favourite with all the young women of taste and reading in the neighbourhood. Half-a-dozen of them, when met to work with their needles, used, when they got a book they liked, and thought I should, to borrow me to read to them, their mothers sometimes with them; and both mothers and daughters used to be pleased with the observations they put me upon making. I was not more than thirteen when three of these young women, unknown to each other, having a high opinion of my taciturnity, revealed to me their love secrets, in order to induce me to give them copies to write after, or correct, for answers to their lovers' letters; nor did any one ever know that I was the secretary to the others." This was an employment well suited to nourish and strengthen Richardson's wonderful faculty of entering into the feelings of other hearts, and giving them true and natural expression.

He was so punctual and industrious during the seven years of his apprenticeship that Wilde used to call him the pillar of his house; yet he did not neglect his private studies, finding time, by stealing it from the hours of rest and relaxation, both for much reading and a good deal of letter-writing. He remained five or six years as foreman in Mr. Wilde's printing-office after his apprenticeship expired, and then set up for himself in Salisbury-court, Fleet-street. Soon finding himself in possession of a good business, he married Miss Allington Wilde, his old master's daughter, whom however he lost in 1731, after she had borne him five sons and a daughter, all of whom he likewise survived. He afterwards married Miss Leake, sister of Mr. James Leake, bookseller, by whom he had five daughters and a son: of these four daughters, with their mother, survived him.

Richardson first became an author in the year 1740. He had been in the habit of occasionally furnishing prefaces and dedications for the works which he printed, at the request of the publishers, and had been often importuned by his friends Mr. Rivington and Mr. Osborne to draw up for them a small collection of familiar letters on subjects of general interest in common life; a task, they conceived, well adapted to his style and turn of mind. Many years before he had been greatly interested by a story of real life that had been told him—the same in its general outline with that of 'Pamela;' he now thought of making it the topic of a letter or two in the proposed little volume; but when he began to reflect on the subject, its capabilities gradually unfolded themselves to him, and "I thought," says he, "the story, if written in an easy and natural manner suitable to the simplicity of it, might possibly turn young people into a course of reading different from the pomp and parade of romance-writing, and, dismissing the improbable and marvellous, with which novels generally abound, might tend to promote the cause of religion and virtue." The result was the composition of the first part of 'Pamela,' the two large volumes of which were written between the 10th of November 1739, and the 10th of January 1740. It was published in the latter year, and became immediately so popular that five editions of it were called for within the twelvemonth. So refreshing and exciting were mere nature, truth, and simplicity, even under many disadvantages and indeed positive offensiveness of style and manner, found to be in a species of composition fitted above all others to amuse and interest the popular fancy, but which had hitherto been cultivated in our language only in a spirit and after a mode of working with which the taste of the most numerous class of readers was the least formed to sympathise.

The first part of 'Pamela' was soon followed by the second part, which was felt at the time by most people to be a great falling off, and which it has since been generally agreed is an attempt at improving the original story that might very well have been spared. The author was led to write it by the appearance of a sequel to his book by another hand, under the title of 'Pamela in High Life'—the wretched speculation of some needy scribbler to turn to his own profit the interest and curiosity which Richardson's work had excited. It ought to be mentioned that Richardson also completed and published the 'Collection of Familiar Letters' out of the project of which his novel had arisen. Another incident connected with the publication of Richardson's first novel is the circumstance of its having been the means of impelling his celebrated contemporary Fielding into the same line of writing: Fielding's first novel, properly so called—his 'Joseph Andrews'—which appeared in 1742, was an avowed burlesque of 'Pamela,' for which Richardson never forgave him.

It was not till after an interval of several years that 'Pamela' was followed by 'The History of Clarissa Harlowe.' The first four volumes of this greatest of Richardson's novels appeared in 1748, and immediately raised his reputation as a master of fictitious narrative to the highest point. The admiration it excited was not confined to his own country; the work, translated into the French and German languages, soon acquired for him a European name. So strong was the hold which the story took of the imaginations of its readers, that, as if the events and characters had all been real, and the author's pen had a power of actual creation and embodiment, many persons, during the progress of the work, wrote to him in the most urgent terms to gratify them by such a winding up of the plot as they had set their hearts upon, declaring that their own happiness depended upon the extrication of the heroine from the miseries in which he had involved her. But Richardson obeyed his own genius, and was not to be persuaded to turn the deep and noble tragedy of unconquerable and triumphant endurance which he had so finely conceived, into a mere common-place stimulant for sentimentalism.

Richardson's next and last great work, his 'History of Sir Charles Grandison,' appeared in 1753. This is of all his works that in which he has most frequently deserted the true field of his genius, and ventured farthest upon ground on which he was not qualified to appear with advantage; and accordingly it contains much more that is tedious and uninteresting than either of his other novels; the plot too has little that excites curiosity or sympathy; and the conception of the principal personage sins against all the principles both of poetical art and of probability and the philosophy of human nature. Yet with all its faults this novel too is full of its author's most graphic and dramatic genius; the whole picture of Clementina, in particular, is perhaps surpassed by nothing in either 'Pamela' or 'Clarissa.'

The only publications of Richardson's that have not been men-

tioned are, a paper in the 'Rambler' (No. 97); an edition of 'Æsop's Fables, with Reflections;' a single printed sheet, entitled 'The Duties of Wives to Husbands' (a subject on which, with all his amenity of nature, he entertained somewhat strong notions); and his 'Case,' a statement of the piracy of his 'Sir Charles Grandison' by the Dublin booksellers. His works brought him a considerable harvest of profit as well as of fame; and his pen and a flourishing business together soon placed him not only in easy, but even, it may be said, in affluent circumstances. He early obtained, through the interest of Mr. Speaker Onslow, the lucrative employment of printing the Journals of the House of Commons; and in 1760 he purchased the moiety of the patent of king's printer. In 1754 he was elected to the post of master of the Stationer's Company. He continued to reside and carry on his business to the last in Salisbury-court; but he had also his country villa, first at North End, Fulham, afterwards at Parson's Green, where his last years were spent in the midst of a little coterie of female admirers. He died on the 4th of July 1761, and was buried beside his first wife, in the middle aisle of St. Bride's church. Deficient in robust manliness of character, no one could be freer from vice of every sort, or more irreproachable, than Richardson. In all the duties of morality and piety he was the most regular and exemplary of men. His principal weakness was a rather greater than usual share of literary vanity, not untinctured with some disposition to underrate other writers of the day, more especially those who were fortunate enough to share the public favour with him in his own walk.

RICHARDSON, WILLIAM, the son of a parish clergyman in Perthshire, was born in 1743. He was educated for the church in the university of Glasgow, became tutor to the sons of Earl Cathcart, and spent two years with these youths at Eton. Afterwards, when their father became ambassador extraordinary to Russia, he accompanied the family to St. Petersburg, where he acted for four years as the earl's private secretary. In 1773 he was appointed professor of Humanity in the university of Glasgow, and discharged the duties of this office till his death, which took place in 1814. Professor Richardson was a highly popular and successful teacher, and also published several literary works of some merit. He was a contributor to the 'Mirror' and 'Lounger,' and the author of two dramas, of 'Anecdotes of the Russian Empire,' and of a series of periodical essays called 'The Philanthrope.' He was best known however for a series of Essays on the principal Characters of Shakspeare, which appeared in three successive volumes beginning in 1775, and were in 1797 collected into one volume, which became very popular and has been reprinted several times. These essays show some small critical talent, and literary skill: their chief fault is the depreciatory spirit in which they treat the great poet, of whose works he has shown himself to be a very incompetent judge.

RICHELIEU, ARMAND JEAN DU PLESSIS, CARDINAL DE, a younger son of François du Plessis, Lord of Richelieu, was born at Paris, in 1585. He studied at the college of Navarre, and was at first intended for the military profession, but his elder brother Alphonse, bishop of Luçon, having resolved to withdraw from active life and retire into a Carthusian convent, young Armand was looked upon as his successor in his see. Accordingly he applied himself to the study of divinity, in which he took a doctor's degree at the age of twenty. The pope objected to his being consecrated bishop of Luçon on account of his youth; but Armand repaired to Rome, and succeeded in convincing the pope of his aptitude for the episcopal office, and he was consecrated in 1607. Having taken possession of his see, he applied himself sedulously to the discharge of his pastoral duties, and in preaching and converting the Calvinists. In 1614 he sat as deputy of the clergy of Poitou in the assembly of the States-General, on which occasion he harangued the young king Louis XIII., and so pleased the queen-mother Marie de' Medici, that she made him her almoner, which was the beginning of his fortune. He was soon made secretary of state, but in consequence of a quarrel between the king and his mother, Richelieu was banished to his diocese. He afterwards acted as mediator between those two personages, and acquired a permanent influence over both. In 1622 he was made a cardinal, soon after which the queen-mother obtained for him a seat in the council in 1624, when he became the chief minister of the crown, and continued such for the remaining eighteen years of his life. The history of his political career forms an important period in the history of the French monarch. Richelieu had three great objects in view: 1, to render the power of the crown absolute, and to humble the feudal nobility; 2, to annihilate the Calvinists as a political party; 3, to reduce the power of the house of Austria, both in its German and Spanish branches, and to extend that of France. Unscrupulous about the means, he succeeded in breaking down the political influence of the nobles, many of whom he sent to the scaffold on various pretences. He put to death Marshal de Marillac, the duke of Montmorency, Cinq Mars, and De Thou, and many more in a cruel manner. Others were shut in dungeons during the cardinal's life. His great political opponent was Gaston d'Orléans, the king's brother, who conspired against the cardinal. The conspiracy failed, and was the cause of the death of Gaston's friends. Gaston then openly revolted against the king, being assisted by the Duke of Lorraine, whose sister he had married. He was not more successful in this attempt, was obliged to seek an asylum in the Spanish Netherlands, and the Duke of Lorraine lost his

dominions, which were seized by the French. The queen-mother, who had quarrelled with the cardinal and supported his enemies, was obliged to quit France. She retired to Cologne, where she died, in 1642, in great distress.

Richelieu accomplished the second object which he had in view, namely, the extirpation of the Calvinist party, by besieging in person and taking La Rochelle, the stronghold of the Calvinists, in 1628. But the motives of Richelieu appear to have been more political than religious: at all events he did not show himself after his victory a fanatic or a persecutor. He secured religious tolerance to the Calvinists by a royal edict in 1629; and when the faculty of theology of Montauban, which was then, as it is now, the Calvinist university of France, went to visit the cardinal, he told them courteously that he could not receive them as a body of divines, but that he should always be willing to see them as men of learning.

The third great object of Richelieu was that of humbling the House of Austria, which, since the time of Charles V., had been the preponderating power in Europe. For this purpose, setting aside all clerical scruples, he supported, first secretly and afterwards openly, the Protestants of Germany against the emperor. His almoner, a Capuchin friar named Père Joseph, was his confidant and trusty agent in all his diplomatic intrigues. The history of this singular character has been published, '*Histoire du véritable Père Joseph*,' and is a most curious biography. The friar repaired to Germany, to the camp of the Protestant princes and of Gustavus, and also to that of Wallenstein. After the death of the two great leaders, Gustavus and Wallenstein, the French troops carried on the war on the Rhine in concert with the Swedes against the emperor. At the same time Richelieu was assisting the Protestant Grisons against the Roman Catholic insurgents of Valtellina, who were supported by the Spaniards. He also allied himself with the States-General of the Netherlands to attack the Spanish dominions in Belgium, which he had in view to annex to France as far as Antwerp, a scheme in which however he failed. On the side of Spain the French took Roussillon, and supported the Catalonians in their revolt against Philip IV. Richelieu is also said to have meddled, by means of Père Joseph and the French ambassador in London, in the first stirring of the Covenanters and Puritans which led to the great revolution. Charles I., ever wavering in his foreign policy, had disappointed Richelieu in his proposal of a defensive league between France and England, and seemed to lean towards a Spanish alliance. "The king and queen of England," said Richelieu, "will repent the rejection of the treaty before the year is over." (Père Orléans; D'Estrade; President Hénauld.) In 1639 arms and ammunition were sent from France to Leith for the use of the disaffected.

In Italy the French invaded Piedmont, which however they evacuated by a treaty with the princes of Savoy. The principal result of all these wars was to circumscribe the imperial power in Germany, and to weaken the influence of Spain in the general politics of Europe.

In 1642 Richelieu fell ill, and died in December, at his house at Paris, at the age of fifty-eight. The king repaired to his bedside shortly before his death, when the cardinal recommended to him Mazarin and others, and told his majesty that he left the kingdom at the highest pitch of glory, and protested to him that all his "doings as a minister had been for the good of religion and of the state," an assertion rather startling from such a man, but which he may possibly have believed. His funeral was magnificent; but the people of Paris made bonfires in token of rejoicing. He had become unpopular of late years, on account of the fresh burdens which he had laid on the people. A splendid mausoleum, by Girardon, was raised to his memory in the church of La Sorbonne. He left a considerable property, which however had not been altogether accumulated at the expense of the state, but was in great part the proceeds of his vast church preferment.

Mary de' Medici had died at Cologne a few months before Richelieu, and Louis XIII. died five months after his minister.

Richelieu established the royal printing-presses; he was the founder of the French Academy; he built the Palais Royal, which was then called Palais Cardinal; and he rebuilt La Sorbonne. He was well informed for his age, and has left several works, some on religious and controversial subjects, and others on politics. His '*Testament Politique*' has been considered by some as apocryphal, but Foncecagne has defended its authenticity in the edition of 1764, by his Letters to Voltaire, and apparently upon sufficient grounds. The '*Mémoires du Cardinal de Richelieu*,' written by himself, have been published in several volumes, in 1822-23, by Petitot, from a manuscript corrected in the cardinal's own hand, which existed in the archives of the department of Foreign Affairs at Paris.

Cardinal Richelieu ranks among the greatest ministers of the old French monarchy. He had extended views, great perseverance and acuteness, and a lofty mind; but he was also revengeful, cruel, and unprincipled. He laboured strenuously to make the authority of the crown absolute, and by so doing he paved the way for the subsequent despotism of Louis XIV. Montesquieu says that Richelieu made his master the second man in the monarchy, but the first in Europe; that he depressed the king, but ennobled his reign.

His grand-nephew, LOUIS FRANÇOIS DU PLESSIS DE RICHELIEU, marshal of France, figured under Louis XV., and acquired a name for his bravery in war and some ability in negotiation, and also for

his libertinism, court intrigue, and overbearing disposition. He died in 1788, at a very advanced age. A grandson of Marshal Richelieu entered the Russian service during the French revolution, was made governor of Odessa, a town which he greatly improved, and became, after the Restoration, minister of Louis XVIII. He was known by the title of Duc de Richelieu. He died in 1821, with the reputation of an honourable and loyal statesman.

RICHTER, JEAN PAUL FRIEDRICH, commonly called JEAN PAUL, was born on the 21st of March 1763, at Wunsiedel, in the neighbourhood of Baireuth, where his father held the office of tertius or under-schoolmaster and organist. Shortly after the birth of his son, he was made pastor of the village of Joditz, whence he was transferred to Schwarzenbach on the Saale. Owing to the very limited circumstances of his parents, as well as to the want of a good schoolmaster, the boy had hitherto been educated and taught at home by his father. At Schwarzenbach however he was sent to school, and continued the study of Latin and Greek, to which Hebrew and some other branches of learning were added. His stay at this school was short, and he was sent to the gymnasium at Hof, where he continued his studies for two years, notwithstanding the death of his father, which happened shortly after his arrival there, and left his family almost in a state of destitution. The young scholar however was in some degree supported by his grandfather on his mother's side. In 1781 he went to the University of Leipzig; for his family wished that he should follow the example of his father, and study theology. He hoped to obtain some support from the university, but he found the difficulties greater than he had anticipated; and he was thrown entirely on his own resources. He had to contend with extreme want, and was sometimes even unable to obtain necessary food and clothing. The circumstances of his mother likewise grew worse, and she was unable to supply him with any money. Notwithstanding this painful situation, he persevered in his studies, and he remained cheerful.

Soon after his arrival at Leipzig he had given up the study of theology, which he found ill-suited to his taste, and now seeing no other possibility of satisfying his most urgent wants, he wrote a book called '*Grönländische Proesse*,' 2 vols., Berlin, 1783. The pittance which he received for his work, small as it was, determined him henceforth to try to support himself by writing. A second book, '*Auswahl aus des Teufels Papieren*,' was soon written, but no publisher could be found, as his first work had not met with a favourable reception. After many disappointments, he quitted Leipzig in 1785, and went to Hof to reside with his mother, who, with her family inhabited a house containing one apartment. All that he possessed was a number of manuscripts containing extracts from the various works which he had read. At Hof his poverty rather increased than diminished, but the unconquerable vigour of his mind and the benevolence of a few friends kept him up. He engaged himself as a tutor in a family, and in 1788 he succeeded in finding a publisher for his '*Auswahl aus des Teufels Papieren*.' The little income which he thus gained was however not sufficient to support him and his family. In 1793 several families of Schwarzenbach united to invite him to come and undertake the education of their children, an offer which he gladly accepted. Here he tried and developed the principles of education which he afterwards (1807) published in his '*Levana*.' His circumstances now began to improve, especially after 1793, when, through the mediation of a friend, he found a publisher for a new work called '*Die Unsichtbare Loge*,' 2 vols., Berlin. This work attracted the attention of the public and brought the author into notice. A fair prospect of success as a writer being thus opened to him, he left Schwarzenbach (1794) and returned to Hof, where in the course of a few years he wrote some of his most admired works: '*Hesperus*,' 4 vols., Berlin, 1794; '*Quintus Fixlein*,' Baireuth, 1796 (this work was the first which appeared under his full name, for in the preceding ones he had only called himself Jean Paul); '*Biographische Belustigungen unter der Gehirnschale einer Riesin*,' Berlin, 1796; '*Siebenkäs*, oder *Blumen-Frucht-und Dornenstücken*,' &c., 4 vols., Berlin, 1796-97, and '*Der Jubelsenoir*,' *ibid.*, 1797. In this year his mother died, after having for a short time enjoyed the happiness of seeing her son appreciated, and Jean Paul now returned to Leipzig. His name was now favourably known, and the most distinguished among his countrymen, such as Gleim, Herder, Schiller, Wieland, and others, esteemed the man no less than his works. In 1798, in which year his work called '*Das Campanerthal*, oder *die Unsterblichkeit der Seele*,' was published at Erfurt, he was induced by Herder, whom he revered more than any other of his friends, to take up his abode at Weimar. It was about this time that he became acquainted with the Duke of Saxe-Hildburghausen, who afterwards honoured him with the title of councillor of Legation (Legationsrath). In 1801 he married Charlotte Maier, the daughter of a distinguished physician of Berlin. He first settled at Meiningen, which in 1803 he exchanged for Coburg; but after a short stay in this town he took up his permanent residence at Baireuth. During this period of wandering he wrote '*Briefe und Bevorstehender Lebenslauf*,' Gera, 1799; '*Titan*,' 4 vols., Berlin, 1800-3; '*Die Flegeljahre*,' 4 vols., Tübingen, 1804-5.

At Baireuth he enjoyed the well deserved fruits of his indefatigable zeal—the esteem and admiration of the most illustrious and best among his countrymen. In 1809 the Prince Primate, Carl von Dalberg, granted him a pension of 1000 florins per annum. In 1815

the prince was obliged to resign his secular sovereignty of Regensburg, Aschaffenburg, Frankfurt, Witzlar, &c., which he had before possessed, together with his archbishopric and primacy of Regensburg, but the pension was continued by Maximilian, king of Bavaria. In 1817 the university of Heidelberg honoured Jean Paul with the diploma of doctor of philosophy, and three years afterwards he was elected an ordinary member of the Academy of Sciences of Munich. From the time of his settlement at Baireuth, Jean Paul pursued his literary occupations as zealously as ever, and only now and then made either little excursions into the neighbouring country, or short journeys to Heidelberg, Munich, Berlin, and Dresden. Among the works which belong to this last and happiest period of his life, we shall only mention 'Vorschule der Aesthetik,' 8 vols., Hamburg, 1804; 'Katzenbergers Badereise,' 2 vols., Heidelberg, 1809; 'Des Feldprediger Schmelzle Reise nach Flätz,' Tübingen, 1809; 'Der Komet, oder Nicolaus Markgraf,' 3 vols., Berlin, 1820-22.

During the last years of his life he was attacked by a complaint in the eyes, which at the beginning of the year 1825 terminated in complete blindness. His physical powers also began to decline, and he died on the 14th of November 1825. Some time before his death he had made preparations for a complete edition of his works. This plan was executed by his friend Dr. Otto, who edited the works of Jean Paul in 60 small 8vo volumes, Berlin, 1826-28. Other editions have since appeared.

Whether we consider Jean Paul as a man or as an author, he is one of the most wonderful phenomena that Germany has ever produced. He was simple-hearted as a child, and his kindness, benevolence, and purity of conduct were unparalleled; yet with all this he had courage enough to struggle fearlessly with a world of adversity, without losing one particle of his cheerful and humorous temper. His works, which are all written in prose, and most of which may be called humorous novels, evince the deepest and most intense feeling, a most profound knowledge of human nature, and an intimate acquaintance with almost every department of science. His earliest writings are sometimes of a satirical nature, and show that he had not yet reached the height of pure humour which appears in his later works. Some of his works, such as the 'Levana,' and 'Vorschule der Aesthetik,' are not novels, but philosophical discussions full of profound thought; but even here his humour sometimes gushes forth and enlivens the abstruseness of philosophical inquiry. Notwithstanding these great qualities of Jean Paul, there are some circumstances which prevent his writings from being as popular as they deserve to be. His ideas and conceptions are too profound to be understood and appreciated by the many, and his thoughts are expressed in a language which presents considerable difficulties even to a German. His sudden transitions, his associations of ideas, the frequent distortions of his sentences, in which parenthesis is put into parenthesis, cause such difficulties to the ordinary reader, as will at first deter him from undertaking the task of searching for the sterling matter which is concealed under such a disguise. Jean Paul moreover possessed an inexhaustible stock of knowledge on all subjects, and his works abound in allusions which can only be understood by those who have made such subjects their study. The number of those who fully appreciate the merits of Jean Paul is, even in Germany, comparatively few; but these few are the best and most enlightened of the nation, and the power which his works exercise over them is greater than that of any other writer. The time when Jean Paul shall be fully appreciated is yet to come. The best key to his writings is a work called 'Wahrheit aus Jean Paul's Leben,' in 8 vols., Breslau, 1826-33, which was commenced by Jean Paul himself, and after his death continued and completed by Dr. Otto. Another very useful work in this respect is, R. O. Spazier, 'Jean Paul Friedrich Richter, ein biographischer Commentar zu seinen Werken,' 5 vols., Leipzig, 1833; H. Döring's 'Leben und Charakteristik Richters,' in 2 vols., Gotha, 1826, is a very indifferent work.

English translations of some and extracts from others of the works of Jean Paul have appeared in various magazines, and as separate publications; but the choicest specimens, which are also most faithfully translated, are those given in 'German Romance,' by T. Carlyle, who has also written some excellent essays on the life and writings of Jean Paul. (See Carlyle's 'Miscellanies,' vols. i. and ii.)

RICKMAN, THOMAS, a distinguished writer on gothic architecture, was born at Maidenhead on June 8th 1776, and brought up by his father, a member of the Society of Friends, who was a surgeon and apothecary in that town, to the same profession. He went in 1797 to London, where he became for a while assistant, first to Mr. Stringer, chemist to the royal family, and next to Mr. Atkinson, in Jernynstreet; but disliking the confinement, he changed not his situation only but his vocation also, and entered into the employment of Messrs. Day and Green, extensive grocers, at Saffron Walden. His residence at Saffron Walden was not however of very long continuance, for in compliance with the wishes of his father, who was anxious that he should complete his medical education, he went again to London, and "walked the hospitals;" after which he returned in 1801 to his father, who was then settled at Lewes, but did not remain with him above two years, when he repaired again to the metropolis, and engaged himself as clerk to a corn-factor. Little likely as this seemed to be to lead him nearer to his ultimate destination, it nevertheless proved a stepping-stone to him, so far that he became a partner in the business.

In 1808, about the time of the death of his first wife (his cousin Lucy Rickman, to whom he had not been married above a year), he removed to Liverpool, where he made another change, for he took a situation in the counting-house of one of the principal insurance-brokers there. Uncongenial and unpromising as it apparently was in itself, this new situation proved the making of his fortune and fame; for as the attention to business it required occupied him only a few hours in the day, he devoted his leisure to the study of architecture.

Having once taken up this study, he pursued it zealously; examined ancient buildings with diligence—in a word, educated himself; and perhaps saw all the clearer because he was not trammelled in his inquiries by the prejudices and conventionalities of a professional education. He was also industrious with his pencil, and carefully noted all those distinctions in the different modes of the pointed style on which he founded his valuable system of classification for it. About this period he married his second wife, Christiana Horner, sister to Thomas Horner, the artist who painted the large panorama of London in the Colosseum, in the Regent's Park.

On the grant of a million for additional churches being made by parliament, Rickman, who had previously made attempts at original design, became a competitor, and a design sent in by him being accepted, he determined to establish himself as an architect: he quitted Liverpool and removed to Birmingham, as being in his opinion a likelier situation for obtaining practice from various quarters. Having no practical experience at that time himself, and being unacquainted with the business routine of the profession, he engaged Mr. Henry Hutchinson as his managing assistant in all matters of business, and after his death (1830) entered into partnership with Mr. Hussey. In 1835 he married his third wife, Elizabeth Miller of Edinburgh, by whom he had a son, and who survived him. Some years previous to his decease he had had an apoplectic attack; but his naturally strong constitution prevailed against its effects, and he continued to exercise his profession up to the time of his death, which happened on the 4th of March 1841.

Had Rickman been known only as a writer, his 'Attempt to discriminate the Styles of Architecture in England' (originally written for a publication called 'Smith's Panorama of Science and Art,' but greatly extended as a separate work, and improved in each fresh edition), would have obtained for him celebrity, for it became a standard work, and is still one almost indispensable to the student. The work however having attracted general attention beyond the limits of the profession, recommended him to all lovers of gothic architecture, opened the road to extensive practice, and procured him patronage in very influential quarters, where as a sectarian he could hardly look for direct countenance and employment. It is to be observed however that by the time his profession brought him much into contact with the clergy, he had withdrawn from the Society of Friends. The following churches—all of them being in one or other of the gothic styles—were designed and erected by him:—Oulton, near Leeds; Hampton Lucy, near Stratford-on-Avon, Warwickshire; St. Philip and St. Jacob, and St. Matthew, King's-Down, Bristol; St. George, Birmingham; St. George, Chorley; St. George, Barnsley; St. Peter's and St. Paul's, Preston; Mellor, Over Darwen, Lower Darwen, and Tackholes, in the parish of Blackburn; two churches in Carlisle; St. David's, Glasgow; St. Jude's, Liverpool; Lower Hardress, Canterbury; Grey Friars, Coventry; Whittle-le-Woods, Lancashire; Ombersley, Worcestershire; Stretton-on-Dunsmoor, Warwickshire; and Loughborough, Leicestershire; he also built the Chapel and Asylum for the Blind, Bristol, and the Roman Catholic chapel at Redditch, besides several private residences, in which he applied the principles he had acquired from his study of gothic structures. At Cambridge he executed the new court and buildings (begun in 1827) of St. John's College; Rose Castle, the palace of the Bishop of Carlisle, was restored by him. Perhaps hardly any individual in the profession had been employed upon so many churches as Rickman; and his churches are certainly superior to the so-called gothic edifices of his predecessors. But none of them that we have seen show evidence of much original inventive or constructive genius; and his work is one that suggests rather diligence and good practical common-sense than philosophic power. But after every abatement is made, it must be granted that to Rickman more than any other man is due the great advance which has within the past few years been made in the knowledge and appreciation of gothic architecture in this country.

RIDINGER, JOHN ELIAS, was born in 1695 at Ulm in Suabia, and was instructed in drawing by his father, who was a schoolmaster, and in the rudiments of painting by Christopher Rasch. His genius led him to animal painting. "He was," according to Fuseli, "one of the greatest designers of animals of every denomination whom the annals of painting can produce." His biographer in the 'Conversations Lexicon' says:—"No painter ever represented with such truth the characters of wild animals. His delineations of them are, as it were, their natural history. They take the spectator into the recesses of the forest, amidst lions, tigers, and other wild beasts, whose figures, dens, and modes of life, are represented by him with the accuracy of a naturalist. His landscapes are always suited to the animals. He was less happy in the representation of the human figure and of tame animals, for instance, horses. His paintings are rare, for he painted but little, his time being almost wholly taken up by his numerous

drawings, which are executed with great accuracy and taste. The largest and most choice collection of them (about 1400) are in the possession of Mr. Weigel at Leipzig. His copper-plates or etchings are very numerous, of which the following are considered as the best:—eight plates of wild animals; forty plates of observations of wild animals; fables of animals, sixteen plates; hunting of animals of the chase by dogs, twenty-eight plates; Paradise, in twelve plates. The coppers are in the possession of Schlossin, repository of arts at Augsburg. Old impressions are scarce, and pretty high in price." Ridinger was chosen in 1757 director of the Academy of Painting at Augsburg, where he died in 1767. His sons, Martin Elias and John Jacob, followed their father's profession. The first, and Ridinger's son-in-law, John Gottfried Seuter, had some share in the execution of his copper-plates. The latter engraved in mezzotinto.

RIDLEY, NICHOLAS, was born in the county of Northumberland, near the beginning of the 16th century. He was educated first at Newcastle, and afterwards at Pembroke College, Cambridge. He received further instruction in France, and having gained some reputation for learning, returned to Cambridge, took orders, and became master of his college. His knowledge and power of preaching having attracted the attention of Cranmer, he was presented with clerical preferment, became one of the king's chaplains, and in 1547 was nominated Bishop of Rochester. His denunciations from the pulpit of the use of images and of holy water soon showed him the strenuous supporter of Protestant doctrines, and his abilities caused him to be associated with the principal reformers both in their chief undertakings and discussions. He frequently disputed on transubstantiation and other doctrines; and he sat as a member of the commission appointed to examine into charges brought against Bonner, bishop of London. The commission deprived Bonner of his dignities, and after some time had elapsed, Ridley was appointed his successor in the see of London. Soon after his appointment he commenced a visitation of his diocese, actively endeavouring to diffuse Protestant doctrines, for the better understanding of which he assisted Cranmer in framing forty-one articles, which were subsequently promulgated. He was nominated Bishop of Durham, but his appointment was never completed. Three instances are mentioned in which he attempted great ends by the force and power of his preaching: he aimed at the conversion of the Princess Mary, went to her residence at Hunsdon, and requested permission to preach before her. This permission she peremptorily refused, and so offended Ridley, who afterwards showed considerable generosity and a ready sense of forgiveness, by interceding with Edward VI. on Mary's behalf that she should be allowed the free exercise of her religion. Secondly, he endeavoured through his preaching to direct the young king's mind to works of charity, describing three sorts of poor—such as were so by infirmity, by accident, or by idleness. Edward, deeply impressed by this sermon, ordered Grey Friars' church, with its revenues, to be a house for orphans; St. Bartholomew's, near Smithfield, to be an hospital; and gave his own house of Bridewell to be a place of correction and work for such as were wilfully idle. (Burnet.) Thirdly, at the instigation of the supporters of Lady Jane Gray, whose case he espoused, he set forth her title in a sermon at St. Paul's, warning the people of the dangers they would be in, and the ruin that would befall the Protestant cause, if the Princess Mary should come to the throne.

On Mary's accession, Ridley was immediately imprisoned. Her detestation of his opinions was aggravated both by the services he had rendered to the Protestant cause and his opposition to her accession. She committed him to the Tower in July 1553, and did not suffer him to be removed until complaints were made that the most learned Protestants were restrained from attending the discussions maintained by the Catholics and the Reformers on different disputed points. In April 1554 a convocation was appointed at Oxford, at which the doctrine of the real presence was to be discussed; and since Cranmer, Ridley, and Latimer were esteemed the most learned men of their persuasion, the queen granted a warrant for removing them from the Tower to the prisons at Oxford. Each disputed in his turn amidst great disorder, shoutings, tauntings, and reproaches; all were considered to be defeated, and all were adjudged obstinate heretics. Ridley never again left Oxford. He was reconducted to prison, and after resisting many efforts to induce him to recant, was led with Latimer to the stake on the 16th of October 1555. The place of his execution was in front of Balliol College. Gunpowder was hung to his neck, but it was long before the flames penetrated the mass of fuel, and explosion did not terminate his miserable sufferings until his extremities were consumed: he bore his tortures with undaunted courage. Burnet says that for his piety, learning, and solid judgment, he was the ablest man of all that advanced the reformation. A list of his works is given in Wood's 'Athene Oxonienses.'

RIDOLFI, CARLO, an eminent Venetian painter of the 17th century, was born at Vicenza about 1600 or 1602. He learned his art at Venice, but subsequently studied both at Vicenza and Verona. When Ridolfi began the practice of his art the Venetian school was already rapidly declining from its original eminence, the manner of Caravaggio and the naturalist having supplanted that of Titian and Giorgione. Ridolfi however adhered to the better style, and produced works of real excellence. His 'Visitation,' painted in the church of the Agnissanti, is especially praised by Lanzi for its colour and correct

drawing and composition. But Ridolfi was not a man of genius like the great founders of the Venetian school, and his example was insufficient to arrest its decay. Besides historical pieces he painted numerous portraits, chiefly half-lengths. He was a man of information and literary attainments, and a member of the Della Crusca Academy. He is now best known as the author of the lives of the Venetian painters, 'Le Maraviglie dell' Arte, ovvero le Vite degli illustri Pittori Veneti e dello Stato,' 2 vols. 4to, Venice, 1648—a work less naïve and amusing than that of Vasari, but greatly superior in erudition and precision, and altogether perhaps the best work of the kind which had up to that time been produced in Italy. In his epitaph, given by Sansovino, a contemporary, and by Zanetti, Ridolfi is said to have died in 1658; but Boschini, 'La Carta del Navegar Pittoreesco,' published at Venice in 1660, speaks of him as then alive. It is not unlikely however, as Lanzi suggests, that Boschini may have written the passage two or three years earlier, and neglected to alter it.

RIES, FERDINAND, an eminent composer of the German school, was born at Bonn on the Rhine, in 1785. He was at first educated under his father, afterwards received instructions from Bernhard Romberg, and finally had a few lessons in composition from Albrechtsberger, the celebrated theorist, to whom he was recommended by Beethoven, the great composer candidly confessing that he possessed not the talent for teaching, which he considered a "particular gift." But the young musician was studious and industrious, and acquired from books more knowledge than he obtained from oral communication. His first professional attempts were made at Munich; his next at Vienna, where he remained till 1805, when he was drawn as a conscript for the French army, which then occupied the capital of Austria, but having early lost the use of one eye, he was declared disqualified for military service. He afterwards went to Paris, and composed much, but not successfully. The Beethoven school, to which he belonged, was then but little understood out of Germany. He afterwards proceeded, through Hamburg, Copenhagen, and Stockholm, to St. Petersburg, where fortune began to smile on his efforts, and was preparing to set out for Moscow, but the French army again deranged all his plans, and he finally determined to visit England, in the hope that he might there at least pursue his peaceful art undisturbed. He arrived in London in 1813, and was immediately received by the liberal violinist Solomon, who procured his admission into the Philharmonic Society, where his symphonies were performed with great applause, and he exhibited his talents as a first-rate pianoforte player. He now was most actively engaged, both as a composer and teacher, and by his unwearied exertions amassed a handsome independence. In 1824 he returned to his native country, continuing however to exercise his talents as a composer, and, besides many works for the pianoforte, produced two German operas, and an oratorio, 'David,' a work of more than ordinary merit. He died at Frankfurt in 1838.

RIGAUD, HYACINTHE, an eminent French portrait-painter, was born at Perpignan on the 25th of July 1659. He was the son of Matthias Rigaud, an artist, from whom he learned the rudiments of painting, and upon whose death he was sent by his mother to Montpellier, and placed under various masters, among whom was Ranc, a portrait-painter. In 1681 he returned to Paris, and in the following year gained the chief prize given by the Academy. He intended to follow historical composition, but was advised by Charles le Brun to practise portrait-painting, and the same artist dissuaded him from visiting Italy. In 1700 he was admitted a member of the Academy of Paris, and presented as his admission-picture a portrait of the sculptor Desjardins—a performance which gained him a high reputation. His success as an artist was now most brilliant; he frequently painted the portrait of Louis XIV., those of the royal family, the principal nobility of the court, and many of the most illustrious personages of Europe. In 1727 he was pensioned and decorated with the order of St. Michael. He was successively professor, rector, and director of the Academy. Grief for the loss of his wife, who died in 1742, coupled with his advanced age, hastened his own death, which happened on the 19th of December in the following year. He left no issue, and no pupil of note except Jean Ranc, who married his niece, and who became principal painter to the king of Spain. Works by Rigaud are contained in most of the collections of Europe. In the Louvre, besides others, are the portraits of Le Brun, Mignard, and Bossuet. His pictures have been engraved by Edelinck, the Drevets, J. Audran, and other eminent artists, and consist of two hundred historical portraits.

Rigaud is considered one of the best portrait-painters of the French school; his heads display much character and expression, his touch is bold and free, yet delicate, and his colouring, though gay, generally speaking free from gaudiness. In his draperies however he was too apt to express a fluttering effect inconsistent with the repose of the other parts of his work, and the attitudes of his figures frequently exhibit unnecessary violence of action. With regard to the title given him of 'the French Vandyck,' it seems difficult to reconcile it with truth, for simplicity and purity of style—one of the most prominent merits of that great painter—is entirely wanting in the works of Rigaud; nor do the two more resemble each other in their style of colouring and in their management of chiaroscuro.

RIGHINI, VINCENZO, a composer of great merit, whose works deserve to be better known, and will probably ere long be rescued from the ill-deserved neglect into which they have fallen, was born at

Bologna, about the year 1758, and received his musical education under the celebrated Padre Martini, but completed it at Prague, where he acquired a vigour which was not then the attribute of the Italian school. Righini composed many operas for different theatres, among which his 'Armida,' 'Tigrane,' 'Enea nel Lazio,' and 'Alcideo al Bivio' are well worth the notice of the true amateur. He died in his native city, in 1812.

RILEY, JOHN, born in London, 1646, was the first Englishman that attained any excellence in portrait, unless perhaps Dobson may be considered as an exception, and in that department he remained unrivalled by any native artist until the appearance of Sir Joshua Reynolds. He was instructed in his art by Fuller and Zoust, but he adopted Vandyck as his model, and painted much in the style of Lely; his draperies were admirable. Riley was a modest and unassuming man, and excessively diffident and distrustful of his powers. "With a quarter of Sir Godfrey's vanity," says Walpole, "he might have persuaded the world he was as great a master." Upon the death of Sir Peter Lely, Riley came into general notice, and obtained the patronage that he merited. He was introduced to Charles II., and painted his portrait, who said, upon seeing it, "Is this like me? Then, odd's fish, I am an ugly fellow," which greatly disconcerted the modest painter. He painted also the portraits of James II. and his queen, Mary of Modena; and after the Revolution in 1688, he was appointed state painter to William and Mary, whose portraits he also painted.

Riley's master-piece is reckoned the portrait of the lord-keeper North, at Wroxton; and among his most successful performances are mentioned also the portraits of Bishop Burnet and the celebrated Dr. Busby, master of Westminster school. Riley died in London, of the gout, in 1691, in the forty-sixth year of his age. His property, which, according to Walpole, amounted to only 800*l.*, came to his scholar Richardson, who had married his niece.

RINCON, ANTONIO DEL, court painter to Ferdinand and Isabella, and the first good Spanish painter, was born in Guadalaxara in the middle of the 15th century, or probably as early as 1446. From the largeness of his style compared with the generally then prevailing Gothic design, not only in Spain but in the greater part of Italy, he is supposed to have studied in Florence, and probably with Andrea del Castagno, or Domenico Ghirlandajo. Most of Rincon's works have already perished, but there is still an altar-piece, consisting of seventeen pictures from the life of the Virgin by him in the church of Robledo de Chavela, on the road from Madrid to Avila, near the Escorial, which display many excellent qualities of art. In 1483 he executed some works in the old sacristy of the cathedral of Toledo; he was employed by Ferdinand and Isabella in several of the royal palaces of Spain, but both pictures and palaces have long since perished by fire, and otherwise. Rincon was decorated with the order of Santiago; he died at Seville in 1500. Antonio's son, Fernando del Rincon, was a good fresco painter.

RIPPERDA, JOHN WILLIAM, BARON, afterwards DUKE OF, a descendant from an ancient and honourable Spanish family, which had settled at Groningen during the period that the Low Countries were attached to Spain, was born in that district in the latter part of the 17th century. His father being a Roman Catholic, young Ripperda was educated in the Jesuits' college at Cologne. After greatly distinguishing himself in the course of his education, Ripperda returned to the United Provinces, and having soon after entered the Dutch army, served during the whole of the war of the Succession, and rose to the rank of colonel. He then married the heiress of very considerable property, in order to obtain which he first renounced the faith of his fathers. Aspiring to political distinction, he eagerly sought a seat in the States-General, and was returned towards the end of the war as deputy for his own province. In 1715 the States appointed him envoy extraordinary to the court of Spain, with instructions to arrange definitively a system of commercial intercourse between the two powers. On his arrival at Madrid, Ripperda immediately attached himself to Alberoni, the all-powerful minister of Philip V. [ALBERONI], whom he assisted with memorials and plans of improvement for the commerce and finance of Spain, and whose protection he secured. During his residence at Madrid, Ripperda carried on several intrigues by no means creditable to his character either as an ambassador or a man; for whilst conducting the negotiations of his native country, Holland, he maintained a secret correspondence with the emperor, and was also guilty of a most disgraceful transaction towards Mr. Doddington, the English minister, in whose pay he seems to have been, whilst he secretly informed Alberoni of all his projects.

In the meantime Ripperda rose high in favour both with Philip and his minister. By his exertions fifty master-workmen from Holland were induced to settle in Spain, and to establish extensive cloth manufactures, first at Azeca, and afterwards at Guadalaxara. Having some time after applied for some recompense for his services, he was answered that the King of Spain could never employ in any high or responsible office a person attached to the Protestant faith. Accordingly, in March 1718, Ripperda quitted the Spanish capital and returned to Holland. Having rendered a full account of his mission, of which the States expressed their approbation, he then formally resigned the office which he held, and set out once more for Madrid, and proceeded thence to Aranjuez, where, soon after his arrival, he

made his abjuration, receiving as a compensation for his losses the appointment of superintendent-general of the royal manufactories at Guadalaxara, with a considerable pension and extensive grants of land. The fall of Alberoni, which was hastened by Ripperda, opened to this ambitious man the way to power, and he was accordingly entrusted, in 1725, with the formation of a secret treaty with the emperor. To reward his services in that memorable transaction, he was soon after created duke, and raised to the dignity of grandee of Spain.

On his return to Madrid, Ripperda was appointed secretary of state in the place of the Marquis of Grimaldi. Having succeeded shortly after in gaining the entire confidence of Philip, he was raised to the post of prime minister. His administration however was not of long duration. Unable to fulfil the secret engagements entered into with the house of Austria, or to accomplish the vast schemes laid down by the treaty of Vienna, such as the recovery of Gibraltar by force of arms, and the seating of the Pretender on the throne of England, schemes which the exhausted state of the Spanish treasury and the menacing attitude assumed by Great Britain compelled him to relinquish, Ripperda fell into disgrace with the Spanish monarch.

On the 25th of May 1727, he was arrested at the house of Colonel Stanhope, where he had taken refuge, and was sent to the fortress of Segovia, where he remained in close confinement, until, having eluded the vigilance of his keepers, he made his escape, and arrived safely in Lisbon, where he embarked for Cork. After spending some time in England, he set sail for his native country in 1731, and settled at the Hague. Whilst there he became acquainted with an envoy from the court of Morocco, of the name of Perez, who was a Spanish renegade, and who, perceiving the violent hatred which Ripperda bore to the Spaniards, and his love of adventure, induced him to try his fortunes upon the shores of Africa. Ripperda accordingly set sail for Tangier, and was well received by the Emperor of Morocco (Muley Abdallah), who gave him the command of an army destined to repel a threatened invasion from Spain. Ripperda was however defeated before Oran, which city fell into the hands of the Spaniards in 1732.

About this time Ripperda is said to have abandoned the Roman Catholic creed, and to have embraced the Mohammedan religion, taking the name of Othman Pashá. He lived for some time at Morocco, surrounded with all the gratifications and luxuries that wealth could supply, and then removed to Tetouan, where he remained until his death in 1737.

It is said that some time previous to his death he believed himself inspired, and endeavoured to propagate a new religion—a mixture of Christian, Jewish, and Mohammedan doctrines, which however had no followers. Shortly after the death of this extraordinary man there appeared at Amsterdam an account of his life and adventures, under this title: 'La Vie du Duc de Ripperda, par M. P. M. B.,' 8vo, Amsterdam, 1739. The same work was translated into English, by John Campbell, and published as 'Memoirs of the Basha Duke of Ripperda,' London, 8vo, 1739. There is also a Spanish translation of it, Madrid, 1748.

\*RITCHIE, LEITCH, was born at Greenock about the beginning of the present century. His first destination was commerce, and for a time he acted as clerk in a banking-house, and for trading firms in London and Glasgow. At the latter place he assisted in establishing a periodical work, called 'The Wanderer,' and when the firm in which he was employed failed, he returned to London, devoted himself to literature, contributed to several journals, magazines, and reviews, and published a volume of tales under the title of 'Head Pieces and Tail Pieces,' another 'Tales and Confessions,' and 'London Night Entertainments.' The 'London Weekly Review,' on which he was principally employed, having changed hands, he retired for awhile to France, where he produced his novel of 'The Game of Life,' in two volumes; and the 'Romance of History—France,' in three volumes. He next wrote some sketchy books of travels, to illustrate the views in 'Turner's Annual Tour,' and 'Heath's Picturesque Annual,' of which two series he produced twelve volumes. He also published 'The Wye; its Scenery and Associations,' with illustrations. He likewise wrote 'The Magician,' a romance in two volumes, and 'Schinderhannes, the Robber of the Rhine,' in one volume, and edited the 'Library of Romance.' On the cessation of the demand for annuals he edited the London 'Era' weekly newspaper; and afterwards established 'The Indian News,' during his connection with which he published 'The British World in the East; Guide to India,' in two volumes. After this he was engaged by the Messrs. Chambers to edit and write for their 'Journal,' for which purpose he removed to Edinburgh, where he has now resided for some years; in 'Chambers's Journal' he produced his latest novel, 'Wearyfoot Common,' which has also been published in a separate form.

RITSON, JOSEPH, a poetical critic and antiquary of the 18th century, was born at Stockton in Durham, and some of his pieces were published there before he came to settle in London. He was by profession a conveyancer, with chambers in Gray's-inn, but being appointed deputy high bailiff of the duchy of Lancaster, he did little in his profession, living on the income which his office yielded him, and spending his time in literary pursuits. During the twenty years between 1782 and 1802, he poured the results of his studies and researches on the public in quick succession; yet not so rapidly that it can be said that they are carelessly executed, or that their contents are worthless. On the contrary, he appears to us to have been

a valuable member of the literary fraternity, and to have done perhaps more than any man to introduce a spirit of curiosity respecting our early poets, and of critical exactness in editing their remains.

The trifling works which he printed before he became settled in London need not be particularised. The first work which brought him into any notice was his 'Observations on the three first volumes of the History of English Poetry,' in a familiar letter to the author (Warton), 4to, 1782. This was the first serious attempt to call the attention of the public to the many inaccuracies and faults of that celebrated work; a bold and useful service, but dangerous to him who undertook it, as Warton had many and powerful friends, who could not bear to see him so roughly handled, even though they could not deny that almost every one of Ritson's strictures was just. However it must be owned that Ritson addressed himself to the work in a very unamiable spirit, and wrote like a man who was not much accustomed to the intercourse of refined society. The work has become, perhaps justly, a bye-word when men would speak of critical abuse. In the next year he published some 'Remarks on the Commentators on Shakspeare,' which is to be distinguished from a larger work published by him in 1792, entitled 'Cursory Criticisms on the Edition of Shakspeare published by Edmund Malone.' In 1783 he also published 'A Select Collection of English Songs, with an Historical Essay on the Origin and Progress of National Song,' of which a second edition was published by Mr. Park in 1813. In 1790 appeared his volume of 'Ancient Songs, from the time of King Henry III. to the Revolution,' reprinted in 1829. This is regarded as one of the most valuable of his works. In 1791 he published 'Pieces of Ancient Popular Poetry,' from authentic manuscripts and old printed copies; in 1793, 'The English Anthology,' in three volumes; in 1794, a 'Collection of Scottish Songs,' and in 1795, the very remarkable poems of a forgotten poet, Minot, on events in the reign of Edward III., which have also been reprinted. In the same year he published his large collection of ballads on the exploits of 'Robin Hood,' with much prefatory matter, in which he cannot be said to appear to any great advantage. In 1802 he produced two works in this department of literature: the one, 'Ancient English Metrical Romances,' in 3 vols. 8vo; the other, 'Bibliographia Poetica,' a catalogue of English poets of the 12th, 13th, 14th, 15th, and 16th centuries, with a short account of their writings, a work very imperfect, but to which succeeding writers in this department have been greatly indebted.

To enumerate however all the works produced by Mr. Ritson in his twenty years' literary career would carry out this article to an unreasonable extent. It may be sufficient to add that there are several small works of his under the denomination of Garlands, as the 'Bishopric Garland,' the 'Yorkshire Garland,' the 'Northumberland Garland,' and 'Gammer Gurton's Garland,' and also several tracts relating to his profession, and especially to the court with which he was more particularly connected. In 1802 he published 'An Essay on Abstinence from Animal Food as a Moral Duty.'

He died in September 1803. Several tracts have appeared attributed to him, and a collection of his correspondence has been published. Some account of his life was published by Mr. Hazlewood in 1824. He had through life the reputation of a surly critic, which his attack on Warton first gained for him, and he was more shunned than courted by his literary contemporaries.

(*Life and Letters of Joseph Ritson, Esq.*, by Sir Harris Nicolas.)

RITTENHOUSE, DAVID, was born on the 8th of April 1732, near Germantown in Pennsylvania. His father, who was a small farmer in that province, intended that he should follow the practice of husbandry, and gave him but little education. But young Rittenhouse, before he was seventeen years of age, displayed a taste for mechanical and mathematical subjects; without books or instructors, he is said to have executed a wooden clock, and, similarly to what is related of Pascal, to have covered the ploughs and fences on his father's farm with geometrical figures. This exhibition of uncommon talent, joined to a conviction on the part of the elder Rittenhouse that the delicacy of his son's constitution would render him unfit for the labour of cultivating the ground, induced the father to procure for the youth the tools of a watch and mathematical instrument maker, and to dispense with his services in performing the duties of the farm. Grateful for this favour, the young man worked diligently with his hands during the day, and at night devoted a portion of the time which should have been passed in taking repose, to the prosecution of his studies. His success appears to have been extraordinarily great, for his biographers assert that, before the age of twenty, he was able to read the 'Principia,' and that he had discovered the method of fluxions, without being aware that this had been already done by Newton and Leibnitz. He also constructed two orreries exhibiting the movements of the planets and their satellites. These machines are said to be still in existence, one in the university of Pennsylvania, and the other in the college of Princeton.

In 1769, Mr. Rittenhouse was made one of a Committee appointed by the American Philosophical Society to observe the transit of Venus which was to take place in that year, and he was so fortunate as to witness the phenomenon in a temporary observatory which he built for the purpose. His observation and the calculations relating to it gained for him the approbation of the astronomers of Europe, and the title of Doctor in Laws was subsequently conferred on him. In

1779 he was named one of the commissioners for adjusting a territorial dispute between the states of Pennsylvania and Virginia; in 1786 he was employed in fixing the line which separates Pennsylvania from the state of New York, and in the following year he assisted in determining the boundary between New York and Massachusetts.

Dr. Rittenhouse was elected a member of the American Academy of Arts and Sciences at Boston in 1782, and of the Royal Society of London in 1795. In 1791 he succeeded Dr. Franklin as president of the American Philosophical Society, to whose 'Transactions' he contributed many papers, chiefly on astronomical subjects. In 1777 he was appointed treasurer of Pennsylvania, and this important office he held with incorruptible integrity till his resignation of it in 1789. In 1792 he received his last appointment, which was that of director of the mint of the United States. In this post his mechanical skill is said to have been highly useful; but in 1795 he was obliged to resign it from bad health, and, after a short but painful illness, he died on the 26th of June 1796.

\* RITTER, KARL, the great improver and promoter of the science of physical and comparative geography, was born on August 7, 1779, at Quedlinburg, about thirty miles south-west from Halle in Prussian Saxony. After receiving his early education at the institute of Schnepfenthal, he proceeded to the University of Halle, whence, in 1798, he went to Frankfurt-am-Main as tutor in the family of Count Bethmann-Hollweg. He accompanied his pupils to the university and upon their travels, visiting with them Switzerland, Piedmont, France, and Italy. In 1807 he published, in two volumes, his 'Europa; ein geographisch-historisch-statistisches Gemälde' (picture). In 1817-18 the first edition of his most important work was published in two volumes, 'Die Erdkunde im Verhältniss zur Natur und zur Geschichte des Menschen, oder Allgemeine vergleichende Geographie als sichere Grundlage des Studiums und Unterrichts in physikalischen und historischen Wissenschaften' ('Geography in relation to the character and history of mankind, or universal comparative geography as a foundation for study and instruction in the physical and historical sciences'). After its publication he was appointed, in 1819, teacher of history in the gymnasium of Frankfurt-am-Main, and in the following year professor-extraordinary of geography in the university of Berlin. His attention to his favourite study was now more undivided. In 1820 appeared 'Vorhalle europäischer Völkergeschichten vor Herodot' ('Portico of a history of the European peoples before Herodotus'); and in 1821 the first portion of a second edition of his 'Erdkunde,' upon a greatly enlarged scale. This first portion included Africa, in one volume; the next eleven, issued between 1832 and 1846 are devoted to Asia in the following divisions: Northern and North-eastern Asia; North-eastern and Southern of Upper Asia; South-eastern of Upper Asia; India, in two volumes; the countries between Eastern and Western Asia; Western Asia—Iran, in two volumes; the terrace-lands of the Euphrates and Tigris river-system; and Arabia. We may add that Herr Ritter also wrote the article 'Asia' for the 'Penny Cyclopædia' in 1834, and in conjunction with Major von Oetzl constructed an excellent atlas of Asia. During this period his official duties were also increased; he was appointed teacher of statistics in the Military Academy, member of the examination-commission and director of the studies of the Royal Cadet Institute, and was also chosen a member of the Academy, and in February 1848 he was elected a foreign member of the Royal Society of London. His other works have been 'Die Stupas, oder die architektonischen Denkmale aus der Indo-Baktrischen Königstrasse' ('The Topes, or architectural monuments of the Indo-Bactrian Highways') published in 1833; 'Die Colonisation von Neu-Seeland,' with a map, in 1842; 'Ein Blick in das Nilquellenland' ('A glance at the sources of the Nile') in 1844; 'Der Jordan, und die Beschiffung des Todten Meeres' ('The Jordan, and the navigation of the Dead Sea') in 1850; 'Über räumliche Anordnungen auf der Ausseits des Erdballs und ihre Functionen in Entwicklungsgänge der Geschichte' ('On the arrangements in space exterior to the terrestrial globe, and their functions in the progressive development of history'), in the same year; 'Ein Blick auf Palästina und seine christliche Bevölkerung' ('A glance at Palestine and its Christian population') in 1852; and 'Einleitung zur allgemeinen vergleichenden Geographie, und Abhandlungen zur Begründung eine mehr wissenschaftlichen Behandlung der Erdkunde' ('An introduction to universal comparative geography, with essays on the founding of a more scientific treatment of geography') in the same year. Ritter has also written introductions and prefaces to the following works: 'Das Buch des Landes, von Schech Ebu Ishak el Farsi el Isztracki,' 1844; to Blom's 'Das Königreich Norwegen statistisch beschreiben,' 1845; to Tam's 'Portuguesische Besitzungen in Süd-West Afrika,' in 1845; to Borbstadt's 'Allgemeine geographische und statische Verhältnisse in graphische Darstellung,' with 38 plates, in 1846; to Hoffmeister's 'Briefe aus Indien,' including travels in Ceylon and continental India, Nepaul, and the Himalayas, a part of which—travels in Ceylon—has been translated into English, in 1847; to a German translation of Diaz del Castillo's 'Die Entdeckung und Eroberung von Mexico,' in 1848; and in the same year to Werne's 'Expedition to discover the Source of the White Nile,' which has been published in English.

RIZI, DON FRANCISCO, a distinguished Spanish painter, was born at Madrid in 1608. He was the pupil of Vincenzo Carduccio,

and had an extraordinary readiness of invention and execution, but was at the same time, as is usual in such cases, superficial and incorrect; still his readiness to design and facility to execute ensured him a brilliant career. In 1656 he was appointed principal painter to Philip IV.; and he held the same place under Charles II., who gave him the additional place of deputy keeper of the royal keys. He had however previously been appointed (1653) painter to the cathedral of Toledo, a post often in Spain more important than that of painter to the king, for he has the charge of all existing works in the cathedral, and generally the execution of all new works, which in Spanish cathedrals were at one time numerous and important.

Francisco Rizi is one of the painters to whom the decline of painting in Spain is attributed, through the mere superficial attractions of his works; and he is said also, by his capricious decorations of the theatre of Buenretiro, to have done equal injury to the architectural taste of the period. Rizi's last work was a sketch for the great altar-piece of the Retablo de la Santa Forma in the Sacristy of the Escorial, which Charles II. ordered for the veil of the magnificent tabernacle and altar, which Rizi had also assisted in making, to contain the Host (La Santa Forma). The subject was the ceremony of the Collocation of the Host by Charles II. in 1634; but Rizi died the following year at the Escorial, having only executed the sketch. The picture was painted by Coello from a sketch of his own, and it is one of the finest pictures in Spain. [COELLO, CLAUDIO.] This Host, or Santa Forma Incorrupta, is the miraculous wafer which bled at Gorkum in 1525 when trampled on by the followers of Zwingli. Rudolf II., emperor of Germany, gave it to Philip II. of Spain, whither it was transported in 1592, and in 1684 Charles II. constructed the present gorgeous altar and tabernacle for its reception, and the present altar-piece is the ceremony of its collocation. When the Forma is exhibited for adoration, the picture, which forms a veil, is let down, and is accordingly much injured. The French, under La Houssaye, who pillaged the Escorial in 1808, carried off all the gold and silver of this altar: the monks hid the 'wafer' in a cellar, and it was restored with great pomp by Ferdinand VII. in 1814.

The pictures (both frescoes and in oil) by Rizi are very numerous: there are several in the Museo of the Prado at Madrid, and many in the churches of Madrid and Toledo, especially in the cathedral of Toledo.

FRAY JUAN RIZI, Francisco's elder brother, born at Madrid in 1595, was also an eminent painter. His principal works are in the Benedictine Monastery of San Martin at Madrid. His design was more correct than his brother's, and his pictures are distinguished for force of light and shade. He retired to Rome, and joined the Benedictines of Monte Casino. He was, while in Italy, made an archbishop, in 1675, by the pope Clement X., but he died in the same year at Monte Casino before entering upon the duties of his office.

(Cean Bermudez, *Diccionario Historico, &c.*; Ford, *Guide for Travellers in Spain, &c.*)

\* RIZO RANGABÉ, and RHIZOS RHANGAVIS, ALEXANDROS, are two different ways of writing the name of a Greek author, Αλεξανδρος Ρίζος Ραγκαβής, who is the present minister of Foreign Affairs at Athens, and one of the finest living poets, dramatists, and orators of Greece. The date of his birth was probably about the year 1810. His father, Jacobos Rizo Rangabé, was the translator of some French plays into Romaic. In a volume of 'Various Poems' (Διαφορα Ποιηματα), which appeared at Athens in 1837, and in a second which appeared in 1840, the son aspired to revive the original drama of his country, and his tragedies of 'Phrosyne,' and 'Η Παραιομνη,' or 'The Eve,' are, especially the latter, rich in passages of beauty and spirit. In 'Phrosyne,' the leading personage is Ali Pasha of Janina, and the principal incident is the destruction by his order of the beloved of his son, Mouktar Pasha; in 'The Eve' an unsuccessful insurrection of the Greeks against the Turks constitutes the main action. Among the shorter poems are translations from the ancient into the modern Greek of the first act of the 'Phoenissæ' of Euripides, and the first book of the 'Odyssey' of Homer. The 'Odyssey,' which is rendered into hexameters, affords an admirable opportunity of comparing the Greek of our own days with the Greek of nearly three thousand years ago. The volumes also contain poetical compositions by the author in French and German, many of them translations from the Greek of his friend the poet Panagiotis Soutzo. His 'Marriage of Kutulus,' an Aristophanic comedy, published in 1845, under the assumed name of Christophanos Neologides, was very successful, and has been translated into German by Sanders. Another volume of tragedies from his pen appeared at Athens in 1851. His prose works are chiefly of an historical and antiquarian character. In 1840, by the desire of the Greek government, he executed a translation from the English of Goldsmith's 'History of Greece,' which was introduced by authority into all the schools—an honour doubtless little anticipated by Goldsmith when he was compiling the work for the booksellers to meet the exigencies of the day that was passing over him. In a second edition, which was published in 1844, Rangabé introduced considerable alterations, and took occasion to re-establish from the original historians the actual wording of sayings that were uttered by the heroes of Grecian history. In 1842 appeared at Athens the first volume of a work in French by Rangabé, 'Antiquités Helléniques' ('Hellenic Antiquities, or a Repertory of Inscriptions and other Antiquities discovered since

the emancipation of Greece'), which is dedicated to Professor Thiersch, as a tribute from "an old pupil." Of this very important work no second volume seems to have yet appeared. Rangabé also took a part in the preparation of a French and Greek dictionary (Athens, 1842), and was one of the editors of the *Ευρωπαϊκός Επαιρητής*, or 'European Contributor,' a Greek magazine, founded at Athens in 1840, which consisted of original articles and translations from the leading periodicals of Europe, the 'Revue des deux Mondes,' 'Blackwood's Magazine,' &c. Rangabé afterwards became secretary of the Archaeological Society of Athens, and a professor at the university founded by King Otho. While holding that appointment he paid a visit to England in 1850, to receive contributions of books for the university library, and he was accompanied on that occasion by Madame Rangabé, who is a Scottish lady, the sister of George Finlay of Athens, the author of several valuable works on the history of Greece. After his return his name appeared before the public as the discoverer of some ancient statues in a temple of Juno at Argos. For some years he had held subordinate posts in the government, but his political career did not assume importance till 1856. In that year, when the relations between Greece and the western powers were on an uneasy footing, in consequence of the leaning which Greece had shown to Russia during the war, the death of General Fabvier, a French officer who had made himself conspicuous in the war of the Greek insurrection, by the part he had taken in the defence of the Acropolis of Athens, afforded the Athenian municipal council an opportunity of taking a step towards the assuaging of angry feelings. It resolved that a funeral oration in his honour should be pronounced in the Acropolis, and appointed Professor Rangabé to pronounce it. The oration which was translated in the French papers, was found so efficient for its object that Rangabé was shortly afterwards named Minister of Foreign Affairs. In that capacity, on the 20th of April 1856, he signed a treaty with Turkey for the mutual suppression of brigandage on the frontiers, and he afterwards successfully defended it in the chambers. By two circulars in June and September he invited the assistance of foreign capital for the construction of roads and harbours in Greece. The last occasion on which his name has appeared in public has been in March 1857, on his bearing public testimony, on the evacuation of Greece by the western powers, to the good conduct of their troops during the period of occupation.

RIZZIO. [MARY STUART.]

ROBERT, King of France, was elected king on the death of his brother Eudes, by that party of the French who rejected the claims of Charles le Simple. [CHARLES III.] He was recognised as king in an assembly of his partisans, held at Soissons in 922, and consecrated in the church of St. Remi, at Reims, by the Archbishop of Sena. He fell in battle against his competitor, Charles le Simple, near Soissons, on the 15th of June 923, having reigned scarcely a year. He was grandfather to Hugues Capet, founder of the third or Capetian race of French kings.

ROBERT, King of France, surnamed 'le Sage' (the wise), and 'le Dévot' (the devout), was the son of Hugues Capet, whom he succeeded on the throne in 996. He was born about 970, and had been twice crowned in the lifetime of his father—at Orléans in 988, and at Reims in 991. The character of Robert was devoid of shining qualities, but he was a prince of upright and peaceable disposition. Early in his reign France was afflicted by a scarcity of four years' continuance, arising from the failure of the harvests, and the scarcity was followed by a pestilence, which again appeared in 1010, and a third time in 1030-33. These calamities are said to have reduced the population of France a third.

Robert was early embroiled with the church; he had married in 995 Berthe or Bertha, widow of Eudes, Count of Blois, but there were some difficulties as to the lawfulness of the marriage, for which Pope Gregory V. refused a dispensation, and declared the marriage void. The king refused obedience, in consequence of which he was excommunicated; and it is said that under this terrible sentence his palace was deserted by all except two menials, who after every meal purified by fire the utensils employed at the royal table. Robert at length yielded; he put away Bertha in 998, and married Constance, daughter of the Count of Toulouse, an imperious and vindictive woman, but one of the greatest beauties of her time. Robert and Constance may be compared in point of character to Henry VI. of England and his consort Margaret of Anjou.

In 1002, Robert engaged in a war to secure the succession of the duchy of Burgogne, of which he was lawful heir; and, being supported by Richard, duke of Normandy, succeeded, after a struggle of thirteen years (1002-15), in gaining possession of it. He bestowed it on his son Henry. In 1006 he marched to the assistance of the Count of Flanders, one of his great vassals, attacked by the Emperor Henry II., who was obliged to retire. Peace was concluded next year between the two princes.

Robert possessed a taste for music, and, prompted by this, as well as his devotional temper, frequently led the choir of St. Denis, and composed hymns for monastic use. He is charged with lavishing his treasure upon mendicants, conniving at thefts from his own person, and truckling to the fierce and cruel temper of his queen, who presumed so far on his tameness as to procure his favourite, Hugues de Beauvais, to be murdered in his presence. Robert visited all the

shrines in France, and went to Rome in 1019 to visit the tombs of the Apostles; perhaps also, as some have supposed, with the view of inducing the pope to annul his marriage with Constance, and to sanction his reunion with his first wife, Bertha.

He persecuted the Jews, and procured, in a council held in 1022, at Orléans, the condemnation of some priests charged with heresy, which was described as 'Gnosticism,' or 'Manicheism,' but the true character of which it is not easy now to ascertain. They were brought to the stake at Orléans, and Constance, with characteristic ferocity, struck out the eye of one of the sufferers, formerly her own confessor, as he passed her in the way to execution.

However Robert may have been led astray by the superstitious and persecuting spirit of the age, his moderation and love of peace were exemplary. He mediated between the Duke of Normandy and the Count of Chartres, who were engaged in hostilities, and obtained the confidence of the Emperor Henry II., who visited him in his camp in 1023. On the death of this emperor he refused, both for himself and his son, the crown of Italy, which was offered him by the malcontents of that country.

His eldest son, Hugues, to whom he had given the title of king in 1022, provoked by the cruelty of his mother, broke out into rebellion, but being taken and delivered up to the king, was pardoned. Hugues died however soon after (1026). Henry, his next son, was then associated with him in the royal title, in spite of the endeavours of Constance, who espoused the interest of Robert, the third son. Robert took up arms against his father, but his rebellion was suppressed. Shortly after quiet was restored King Robert died at Melun, in 1031, sincerely regretted, as it appears, by his subjects. He was buried at St. Denis.

ROBERT I., King of Scotland. [BRUCE, ROBERT.]

ROBERT II., King of Scotland, the first of the House of Stewart who reigned in that country, was born on the 2nd of March 1316, and was the only child of Walter, the Stewart of Scotland, and his wife Marjory, daughter of King Robert Bruce, to whom he had been married the preceding year. All that is known of the House of Stewart previous to this date is, that a Walter, son of Alan, was Stewart or Dapifer of Scotland in the reigns of David I. and Malcolm IV.; that he was succeeded in that high office by his son Alan; this Alan by his son Walter; Walter by his son Alexander, who was one of the regents appointed during the minority of Alexander III., and who, in 1263, commanded the Scottish army at the battle of Largs; Alexander, by his son James, who was regent after the death of Alexander III., and died in 1309 at the age of sixty-six, and he, by his son Walter, the father of Robert II. This Walter was one of the commanders of the Scottish army at the battle of Bannockburn; and early in the following year, 1315, Bruce gave him in marriage his daughter and then only child Marjory, upon whom, provided she should marry with the consent of her father, or, after his death, with the consent of the majority of the community (or states) of the kingdom, the crown had been settled, failing the heirs male of her father and of his brother Edward, in a parliament held at Ayr on the 26th of April in that same year. Robert was the only issue of this marriage. Lord Hailes ('Annals of Scotland,' vol. II., Appendix i.) has sufficiently refuted the tradition that Marjory was killed by being thrown from her horse when big with child, and that Robert was brought into the world by the Cæsarean operation; but it appears that she died either in giving birth to the infant or soon after her delivery. Her husband died on the 9th of April 1326, after having had another son, Sir John Stewart of Railstone, by a second marriage with a sister of Graham of Abercorn.

Bruce was succeeded by his son David II., born of a second marriage, 5th of March 1324; and his unfortunate reign—marked by a long minority and a succession of regencies, during which the kingdom was overrun by Edward Balliol and his ally Edward III., and David was obliged to make his escape to France, and after that by the defeat of Neville's Cross, when David was taken prisoner by the English—fills up the interval from 1329 to 1371. Robert, the Stewart, acted a principal part throughout this reign, and was as much distinguished by his personal merits and conduct as by his high rank. While yet only a youth of sixteen, he commanded the second division of the Scottish army at the decisive battle of Halidon, fought, and lost by the Scots, 19th of July 1333; and after that fatal day he was one of the first to uplift again the standard of the national independence. In 1334, he and the Earl of Moray assumed the regency of the kingdom, and, although not formally invested with the government by any assembly of the states, were recognised by the people as entitled, in the infancy and exile of the king, to wield all the authority of the crown. Fordun's description of the Stewart at this time, as Lord Hailes translates the passage, is as follows:—"He was a comely youth, tall and robust, modest, liberal, gay, and courteous; and, for the innate sweetness of his disposition, generally beloved by true-hearted Scotsmen." In a subsequent passage however he hints that his conduct as yet was not always regulated by absolute wisdom,—"qui tunc non magna regebatur sapientia." On the Earl of Moray being taken prisoner by the English the following year, the Stewart, in concert with the Earl of Athol, concluded with Edward III., on the 18th of August 1335, the treaty of Perth, which was in fact a submission, though upon honourable conditions, to the English king.

After this we hear no more of the Stewart till 1338, when, upon the death of the regent, Sir Andrew Moray, we find him again appointed to that supreme office. His resumption of the government was soon followed by the expulsion of the English from all their strongholds to the north of the Forth, and his regency was terminated by the return of the king, on the 4th of May 1341. In 1346, after the capture of the king at the battle of Neville's Cross, where he commanded the left wing of the Scottish army, in conjunction with the Earl of March, the Stewart was again elected regent, or 'locum tenens serenissimi principis David,' &c., and he held this post till the release of David, in 1357, governing the country, it is affirmed, with remarkable prudence and ability in the difficult circumstances in which he was placed. In 1359 the earldom of Strathern was conferred upon him by the king. When David, in 1363, astonished the nation by proposing to a parliament, held at Scone, that in the event of his dying without issue, Lionel, duke of Clarence, son of Edward III., should be chosen king, the Stewart, whose interests, as well as his patriotic prejudices, this project so nearly touched, was one of the foremost of those who adopted instant measures to defeat it. He entered into an association with the earls of March and Douglas, and with his own sons, and he even appears to have taken up arms with the avowed determination of driving the king from the throne, if he persisted in his purpose. David however found means, without making any formal concession, to put down this threatened resistance; and, upon a general amnesty being granted, the Stewart, on the 14th of May 1363, renewed his oath of fealty, and entered into a bond to abstain from all such confederacies in time coming, on pain of forfeiting for ever all right and title to the crown, as well as to his private inheritances. Soon after this David, who had lost his first wife, Joanna, a daughter of Edward II., in the preceding year, contracted a second marriage with Margaret Logan; but she also bore him no children; indeed he had separated from her some time before his death, which took place on the 22nd of February 1371.

Upon this event the states of the kingdom immediately assembled at Linlithgow; and after a slight opposition on the part of the Earl of Douglas, who conceived that he had himself a claim to the vacant dignity, as representing the families both of Comyn and Balliol, the Stewart was unanimously declared king, by the title of Robert II. He was crowned at Scone, on the 26th of March, and next day, according to custom, received the homage of the bishops and barons, seated on the moot-hill there.

Robert II., when he thus succeeded to the throne, was somewhat peculiarly situated in regard to his domestic relations; and the point demands particular notice, inasmuch as a controversy has thence arisen on the question of the legitimacy of the Stuarts, which continued to be agitated, both among antiquaries and political writers, down to the middle of the last century. His first wife was Elizabeth, daughter of Sir Adam Mure, of Rowallan; but the family he had by her, consisting of four sons and six daughters, had all been born before their marriage. In ordinary circumstances a subsequent marriage might probably, in Scotland, even at this early date, have legitimatised these children, at least in the eye of the Church, although their right of civil succession, and especially of succession to the crown, might not have been in that way so certainly established; but there was a very awkward speciality in the present case. Robert and Elizabeth Mure had been living not only in concubinage, but in what the Church considered incest, for they were related, it seems, in the fourth degree. Nay, to make matters worse, the Stewart, before his acquaintance with Elizabeth Mure, had been connected in the same way with Isabella Boutelier, who was related to her in the third degree; and this, according to the canonical doctrine, placed him in a relationship by affinity of the same, that is, of the third degree, to Elizabeth Mure. His marriage in any circumstances therefore with that lady, would have demanded a papal dispensation; but it was far from being universally admitted that even the authority of the pope could establish the legitimacy of children born in a connection which thus openly violated and set at defiance what was believed to be the divine law. It is obvious that a dispensation to persons within the prohibited degrees to marry is an exercise of prerogative on the part of the head of the Church much inferior to the legitimisation of the children already produced from an incestuous connection. So strongly in the present case does this appear to have been felt, that the pope's dispensation actually proceeds upon the monstrous supposition that Robert and his wife Elizabeth Mure, long as they had lived together, had been all the while ignorant of their relationship, and on that manifestly fictitious ground alone does his holiness profess to sanction their marriage, and to pronounce the legitimacy of their children. But the dispensation by no means satisfied the popular feeling of the time; and there is reason to believe that the supposed defect in the right of the reigning family materially contributed in exciting and sustaining some of the most formidable of the insurrectionary attempts which convulsed the Scottish kingdom in the course of the succeeding century. Robert, after the death of Elizabeth Mure, had married Euphemia Ross, a daughter of the Earl of Ross, by whom he had two more sons and four daughters, also all born when he came to the crown. Thus circumstanced, in 1371, immediately after his accession, he got the states to pass an act recognising John, earl of Carrick his eldest son by Elizabeth Mure, as his successor; and, still better to secure

the rights of his first family, he procured, in 1373, another act expressly entailing the crown upon his heirs male of both families, and after them upon his heirs whatsoever. It is obvious that, whatever might be the force of this parliamentary settlement in securing the crown to Robert's heirs male by the sons of Elizabeth Mure, who were named in it, as soon as such heirs failed, the question would legally arise, who were his heirs whatsoever, or general? and if the papal legitimisation of the first family should be set aside, then his heir whatsoever would have to be looked for among the descendants of one of his sons or daughters by Euphemia Ross. Now, it so happened that such was the case on the death of James V., leaving only a daughter, Mary, in 1542. At this moment the heir-general of Robert II., on the supposition of his family by Elizabeth Mure being illegitimate, was the Earl of Menteith, the lineal descendant of Euphemia Ross's eldest son, David earl of Strathearn; and it is a remarkable fact that in the early part of the 17th century the pretensions put forward on this ground by the then Earl of Meinteith, who was justice-general, and president of the Scottish privy council, occasioned no small uneasiness to Charles I., and brought down ruin upon himself. For the latest and also the most learned and acute discussion of this question, the reader is referred to 'Tracts, Legal and Historical, with other Antiquarian Matter, chiefly relative to Scotland,' by John Riddell, Esq., Advocate, Svo, Edinburgh, 1835; dissertation iii., entitled 'Remarks upon the Law of Legitimation per Subsequens Matrimonium, the Nature of our Ancient Canons, and the Question of the Legitimacy of the Stewarts,' pp. 155-211.

A truce for fourteen years had been concluded with England two years before the death of the late king; and as long as Edward III. lived, the two countries remained at peace. In 1377 however, immediately after the accession of Richard II., a war arose out of what appears to have been at first a private quarrel between the English garrison at Roxburgh and the Earl of March. Hostilities continued, with a few short interruptions, till November 1380, when a truce for twelve months was arranged, which was afterwards extended to the summer of 1383. In 1384 however, the war broke out again with more violence than ever, the Scots being now assisted by a body of French auxiliaries, who arrived in May 1385, under the command of Jean de Vienne, admiral of France. In the summer of that year, while the young English king led his army in person into the north, laying waste the country and burning every town and village he came to in his progress [RICHARD II.], a force of Scots and French, entering England by the western marches, ravaged Cumberland and laid siege to Carlisle, but withdrew when the enemy returned southwards, without having effected an entry into that town. Soon after this, the French, who had found the Scots and everything in Scotland very little to their mind, and had also made themselves greatly disliked by the people they came to assist, returned home, though not till they had agreed to pay the expense of their maintenance, and had been forced to leave their leader Vienne as a hostage for the performance of that engagement—a conclusion of the business which has drawn much obloquy upon the Scots, though there is little doubt that the real object of the French in this expedition was certainly much more to annoy the English than to benefit the Scots. A truce for another year followed the departure of the foreigners; but the fighting was renewed in 1387. That year the town of Carlingford in Ireland was plundered and burned by a force under the command of William Douglas, recently created Lord Nithsdale, and married to one of the king's daughters; and in 1388 the famous battle of Otterbourne, or Chevy Chase, was gained from the Percies, though at the expense of his own life, by the Earl of Douglas. [RICHARD II.] By this time however the reins of government had nearly dropped from the hands of king Robert. Froissart tells us that, being unfitted by his years and broken health for going out any more to war, he was no longer consulted in public affairs by the nobles, by whom and also by the nation in general the king's second surviving son, Robert, Earl of Fife (afterwards Duke of Albany), was now looked upon as the true ruler of the country. In 1389 the Earl of Fife was formally recognised as governor of the kingdom by an assembly of the estates held at Edinburgh. After this the old king appears to have lived almost entirely on his ancestral estate in Ayrshire, where indeed he had been much in the habit of secluding himself for some years previous. It was probably now, in his old age, that his originally engaging personal appearance was deformed by the breaking out of an inflammation in his eyelids, from which he derived his popular designation of Blear-eye. The fable about his birth makes him to have been wounded in one of his eyes by the surgeon who cut him from his mother's side.

The war with England was prosecuted by the regent for some months with considerable vigour; but before any action of importance had taken place, hostilities were terminated for the present, in June 1389, by a truce concluded between France and England for three years, in which the allies of both powers were comprehended. The country was therefore at peace when Robert II. died, after a short illness, at his castle of Dundonald in Kyle, on the 19th of April, 1390.

Besides his six sons and ten daughters by his two wives, this first of the royal Stewarts had a numerous illegitimate progeny by various other women. His six lawfully begotten daughters married into the families of the Earl of March, Lyon of Glamis (now earls of Strath-

more), Hay of Errol (now earls of Errol and earls of Kinnoull), Macdonald of the Isles, Douglas of Nithsdale, Lindsay of Glenesk, the Earl of Douglas, Keith earl Marischal, Logan, and Swinton. From six of his illegitimate sons the Stuarts of Bute, Cairney, and other families of that name deduce their descent. Robert II. was succeeded by his eldest son Robert III.

ROBERT III., King of Scotland, the eldest son of Robert II., relinquished his original name of John on succeeding to the crown, on account, it is said, of a popular superstition of his countrymen which regarded that name as unlucky or ominous. But if so, it is rather strange that the heir apparent should have ever been so christened. He was known throughout the preceding reign by the title of the Earl of Carrick, a dignity which had been bestowed upon him by King David II. Before acquiring that dignity he appears to have been designated the Lord of Kyle. He was probably born before the year 1340, so that he was past fifty when he came to the throne, on the death of his father, in 1390. It is known that he had been married at least since the year 1357, to Annabella Drummond, a daughter of Sir John Drummond of Stobhall. He had been lamed in his youth by a kick from a horse; and this accident, combined with his mild and pacific disposition, of which perhaps it was in part the cause, made him be regarded, both before he became king and afterwards, with feelings of something very like contempt by the generality of his countrymen.

The coronation of Robert III. took place at Scone on the 14th of August 1390. No events of any note mark the first eight or nine years of the reign, during the whole of which the king's brother, the Earl of Fife (who was in 1398 created Duke of Albany), continued to retain the management of public affairs, and even, according to some authorities, the title of governor or regent. [ROBERT II.] The truce which had been made with England in 1389, was kept up by various continuations throughout the reign of the English king Richard II. But war broke out again on the accession of Henry IV., in 1399; France, as usual, exciting the Scots to harass England by predatory expeditions across the borders, which could only end in drawing down signal vengeance on themselves. In August of the following year, accordingly, Henry entered Scotland at the head of a powerful army, and advanced as far as Edinburgh, which was however successfully defended by the king's eldest son, the Duke of Rothesay; and Henry returned home after having received the submission of various towns and villages through which he passed, but without having given the country cause to remember his visit further than by this mere demonstration of his power. In the following year however Henry Percy (Hotspur) made a more destructive inroad as far as to Preston in East Lothian. On this occasion Percy was joined by the Scottish Earl of March, who had recently thrown up his allegiance and gone over to the English king, in a fury of revenge provoked by the ill usage he held himself to have received from the Duke of Rothesay, who, after having been affianced to his daughter, had married a daughter of the Earl of Douglas. The following year, 1402, is memorable for the tragical catastrophe of Rothesay, who, at the instigation of his uncle Albany, the friend of March, was, on the pretence of restraining or punishing his dissoluteness, seized under an order professing to be signed by his father, and confined first in the castle of St. Andrews, and then in that of Falkland, where he is believed to have been left to perish of famine. He was only in his twenty-fourth year when he thus fell a victim, in all probability, to the dark ambition of his kinsman. A few weeks after the prince's death, a pardon or remission in very ample terms for any concern he might have had in this affair was granted by the king to Albany; and has been published by Lord Hailes in chapter vi. of his 'Remarks on the History of Scotland,' Edinburgh, 1772. In this remarkable paper it is stated that Albany admitted the capture and arrest of the prince, but justified what he had done by reasons which the king did not then hold it expedient to publish to the world. No express denial of the fact of the murder is ventured upon; it is merely recited that the prince departed this life in his prison at Falkland, through divine providence, and not otherwise—"ubi ab hac luce, divina providentia, et non aliter, migrasse dignoscitur." "The reader," observes Hailes, "will determine as to the import of this phrase. If by it a natural death was intended, the circumlocution seems strange and affected." It ought to be added that Archibald, the young earl of Douglas, the brother-in-law of Rothesay, who had acted throughout the affair along with Albany, was equally charged by the voice of common fame with the murder, and was included in the same acquittal or indemnity. It is conjectured that Rothesay had made the proud baron his enemy by his infidelity to or neglect of his sister.

This same year, on the 22nd of June, the Scots, commanded by Patrick Hepburn of Hales, were defeated with great loss, at West Nisbet in the Merse, by the English under the conduct of the Earl of Northumberland and the Earl of March; and on the 14th of September following the Earl of Douglas received a still more disastrous discomfiture from the Lord Henry Percy at Homildon Hill in Northumberland. When immediately after this the Percies rose in rebellion, the Duke of Albany put himself at the head of a numerous force, and set out for the south with the design of taking advantage of the embarrassing circumstances of the English king; but the news of Henry's victory at Shrewsbury turned him back before he had got across the border. In the course of the two following years several attempts were made

to arrange a peace, or long truce, between the two countries, but without success. Hostilities however had been for a considerable time suspended by these negotiations, when King Robert, now awakened to a strong suspicion of the designs of his brother Albany, resolved to send his only surviving son James, styled Earl of Carrick, to France for safety; and the prince, then in his eleventh year, was on the 30th of March 1405 captured at sea by an English vessel on his way to that country. [JAMES I. of Scotland.] His detention by King Henry is believed to have broken the heart of his father, who expired at the castle of Rothsay, in Bute, on the 4th of April 1406. He was succeeded by his son, James I.

ROBERT OF GLOUCESTER is supposed to have been a monk in the abbey there, but of his personal history nothing whatever is certainly known. It may however be collected, from a passage in his work, that he was living at the time of the battle of Evesham; and he seems to have lived not very long after that event, as the history of English affairs which he has left us ends before the beginning of the reign of Edward I.

This history is the only writing that is attributed to him, and is, in more points of view than one, among the most curious and valuable writings of the middle period that have come down to us. It is a history of English affairs from the beginning, including the pictures of Geoffrey of Monmouth, and ending with the death of Sir Henry of Almaine, valuable in the latter portions for the facts which it contains, whether peculiar to itself or correlative with the statements of other chroniclers; and abounding throughout with anecdotes or minor historical circumstances peculiar to itself, and sometimes of an interesting if not useful nature.

It is in the vernacular language of the time; that is, in the language in which we find the Anglo-Saxon passing into the language of Chaucer and Wycliffe, this work and the similar work of Robert of Bonne being the best specimens which remain of the language. It is in verse, and may stand therefore as a specimen of the poetry of the time. It consists of more than ten thousand lines.

The work was popular in the middle ages, as appears by the number of manuscripts that still exist of it. The principal are the Bodleian, the Cottonian, and the Harleian. There is one in the library of the Herald's College. There are slight variations in the text of each, and that at the Herald's College appears to have had the language modernised by some early copyist. Little regard was paid to Robert by the persons who in the reign of Elizabeth collected and printed the manuscripts of the best English chroniclers, though Camden, in his 'Britannia,' and still more frequently in his 'Remains,' has citations from him. Weever, in his 'Antient Funeral Monuments,' has many quotations from him; and Selden quotes him on several occasions. The work was given at large to the public in 1724 by Hearne in two octavo volumes, of which there was a reprint in 1810.

ROBERT (GROSSETESTE), Bishop of Lincoln, a very eminent scholar and prelate in the early years of the reign of Henry III. The exact time and the place of his birth, and the family from which he sprung, are alike lost in the obscurity of those remote times; but it may be calculated from the dates ascertained of other events in his life, that he was born about the year 1175. He studied at Oxford, and, like most of the very eminent of the English theologians of that period, he went from thence to Paris. He there applied himself to the study of the Hebrew and Greek languages, of both of which he attained the mastery, and distinguished himself by his attainments in the whole course of study presented to the students in that learned university. He returned to England skilled not only in the five languages, English, French, Latin, Greek, and Hebrew, but skilled also in logic and philosophy, divinity and the Scriptures, and possessing also a knowledge of medicine and ecclesiastical law. There is no exaggeration in this, for many of his writings have descended to our time, which prove the statement, to a considerable extent at least. We may refer particularly to his numerous treatises in natural philosophy, which it will not be expected of us to describe individually, as the titles, with little more respecting them, fill four quarto pages of Dr. Pegge's Life of him (4to, 1793, pp. 278-283).

When he returned to England, he settled at Oxford, where he delivered lectures. There is extant a letter of Giraldus Cambrensis to the Bishop of Hereford, recommending Grosseteste to his notice, but the bishop died so soon after, that little advantage can have arisen from it. He found however a very efficient patron in another prelate, namely, Hugh de Wells, Bishop of Lincoln, who, as a first mark of his favour, gave him the prebend of Clifton in the church of Lincoln. He had also several archdeacons, as of Chester, Northampton, and Leicester, and in 1235 he succeeded his patron in the bishopric of Lincoln, then a diocese of immense extent. This dignity he held for eighteen years, dying in 1253.

Bishop Grosseteste made the power which his acknowledged and extraordinary attainments gave him, subservient to the accomplishment of important public objects. He was a great reformer of his diocese, a vigilant superintendent of his clergy, a maintainer of order among them and in all ecclesiastical affairs. If one of the great earls or barons offended, he did not scruple to assert at once the right he possessed to correct the abuse, of which an instance is related in his calling the Earl of Warren to account for irregular religious solemnisations. He stood up against the king when he would interfere with the

rights of the clergy, who formed in those times the strongest part of the opposition to the will of kings, who, if there had been no clergy, would have been almost absolute; and he opposed with equal firmness and success the pope, when he would support ancient abuses or introduce new, to the injury of the English clergy or people. In short, he can hardly be regarded in any other light than one of the great benefactors to the English Church and nation in the discharge of his political duties as a bishop, and he was one of the lights of his age by the lectures which he delivered and the books which he wrote. His attainments in natural science, however, gained for him the reputation of being a magician and a sorcerer, and many fables gathered about his name.

Many of his writings have been printed, and many remain in manuscript and are found in most of the great libraries of Europe. An ample list of these is given in Dr. Pegge's work before referred to; in which work may be found critical inquiries into all the particulars of his life, and a great mass of curious information respecting the state of ecclesiastical affairs in England in the first half of the thirteenth century.

ROBERT, HUBERT, an artist, celebrated for his admirable architectural compositions and subjects of that class, was born at Paris in 1733. On quitting school Robert applied himself assiduously to his studies. In 1753 he set out for Rome, and spent twelve years in that city, occupied not merely in making drawings and views of nearly all the numerous architectural monuments, but studying their character completely. Thoroughly impressed with the poetry of such subjects, he enabled others to feel it likewise, by the peculiar charm with which he invested them and by his felicitous treatment, so different from that whose chief merit consists in literal exactness and cold correctness. On his return to Paris he was immediately elected by the Academy, and his reputation became established as one whose productions formed an epoch in that department of the art which he had selected.

Among his numerous works are many chefs-d'œuvre of first-rate excellence. Two of the most remarkable for the singularity of the idea are those representing the Musée Napoléon, the one in all its pride and pomp, and the other, an architectural wreck, as it may perhaps present itself to the eye after the lapse of centuries. Robert was an enthusiast in his profession: he was indeed one of those fortunate persons whose existence seems to form an exception from the common lot of mortals. Happy in himself, happy in his union with a most amiable woman, possessing a source of constant enjoyment in his art, his life passed in one uninterrupted tenor; in a calm, undisturbed even by the stormy period of the revolution. Nor was he less happy at its close, for he died almost without a struggle, and with his pencil in his hand, on the 15th of April 1808, at the age of seventy-six.

ROBERT, LEOPOLD, a modern French artist of great and deserved celebrity, was born at Chaux-le-Fonds, in the canton of Neuchâtel, in 1797. His father intended to bring him up to his own trade, which was that of a watchmaker; but yielding to the boy's decided inclination for the arts, sent him to Paris to study engraving under Girardet, an artist known by his print of the 'Transfiguration,' after Raffaele. His progress was so rapid, that in 1812 he obtained the second grand prize at the École des Beaux Arts, after which he began to study painting in the school of David. He then proceeded to Italy, and, renouncing engraving altogether, devoted himself entirely to his pencil, leading a life of solitude and privation, without either patrons or friends. But though his enthusiasm for his art was great, it was marked rather by severe application than by that promptitude which is generally supposed to characterise genius. Though he worked constantly, he executed few productions, being not only remarkably slow with his pencil, but in the habit of destroying or laying aside picture after picture until he could satisfy himself with the subject that he had commenced. He is said to have thus spent between three and four years on a single picture; for instance, that of the 'Reapers,' which excited so much admiration when first exhibited at Paris in 1831. In that piece, in the 'Neapolitan Improvisatore,' the 'Madonna dell' Arco,' and similar subjects, he succeeded in delineating Italian life and character in the happiest manner, with perfect fidelity, but also with a touching refinement and grace, at the same time without any of that affectation which the French schools are apt to mistake for refinement. His last work was his 'Venetian Fishermen,' a picture that has served to raise his name as that of the greatest artist of his age in the peculiar walk which he had chosen. The general admiration which it excited when exhibited at Paris was however mingled with mournful regret at the fate of the artist himself; for he had previously put an end to his life at Venice, where he had resided several years, and where he drowned himself on the 20th of March 1835, in his thirty-eighth year.

\* ROBERTS, DAVID, R.A., was born in 1796, at Stockbridge, Edinburgh. Being designed for business, he was apprenticed to a house-painter in that city; but as soon as he could follow his own bent, he entered as a student in the Trustees' Academy, whence he proceeded so many eminent painters in every branch of the art. About 1821 or 1822 he came to London, and for some years practised as a scene-painter, having, during much of his career in the theatre, Stanfield for his colleague. Occasionally however an oil-painting by

him appeared in the exhibitions, and he began to be regarded as one of our most promising painters of architectural subjects. After his visit to Spain, 1832-33, he does not seem to have returned to scene-painting. His Spanish pictures were much admired, and a folio volume of lithographic copies of his 'Spanish Sketches' did much to extend his reputation. From 1835 to 1838 inclusive he furnished the illustrations to the 'Landscape Annual,' embracing views selected from many of the most picturesque parts of Spain and Morocco; he also made the drawings for the original edition of Sir Bulwer Lytton's 'Pilgrims of the Rhine.' Like many other young painters Mr. Roberts joined the Society of British Artists, of which he came to be a vice-president; but he resigned his connection with that society when, from the celebrity acquired by his Spanish pictures and sketches, it became evident that his admission into the Royal Academy would, on application, be a matter of certainty. He was accordingly elected A.R.A. in 1839, and admitted to the full honours of an academician in 1841.

The success of his Spanish views led Mr. Roberts to make a protracted visit to Syria and Egypt, where, with marvellous patience and unflagging industry, he made a body of drawings and sketches which, for extent, variety, and finish, have never perhaps been equalled by a single artist while travelling in such a country and exposed to such a climate. And they are admitted by all competent judges who have followed the artist over the country he has depicted, to be as accurate as they are graceful and brilliant. Lithographic fac-similes of these sketches form the well-known and very splendid work entitled 'The Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia,' four volumes, large folio, 1842, &c. The drawings of this great work were placed on the stone by Mr. Haghe [HAGHE, LOUIS], in a style that left nothing to be desired, and the work on its completion took its stand by general admission at the head of all such publications hitherto issued in this or any other country. Throughout the Continent it bears as high a fame as in England.

For some years after his election into the Royal Academy, Mr. Roberts's pictures in the exhibitions of that body chiefly consisted of subjects collected in his Eastern tour. Among the more noticeable ones a few may be mentioned:—'The Outer Court of the Temple at Edfou in Upper Egypt'; 'Statues of the Vocal Memnon on the Plain of Thebes,' and 'The Greek Church of the Holy Nativity at Bethlehem, taken during the Resort of Pilgrims at Easter,' 1840; 'The Temple of Denderah,' and 'Jerusalem from the Mount of Olives,' 1841; 'Thebes, looking across the Great Hall,' 'Petra,' and 'Interior of the Church of St. Miguel, Xercy, Spain,' 1842; 'Gateway of the Great Temple at Baalbec,' 'Ruins on the Island of Philoe,' and 'Entrance to the Crypt—Roslin Chapel,' 1843; 'Pyramids of Ghizeh,' 'Chapel of Jean at Caen, Normandy,' 1844. In 1845 he exhibited only two pictures, but they were large in size and ambitious in character—'Ruins of the Great Temple of Karnak, looking towards the Libyan Hills—sunset,' and 'Jerusalem from the South-East—the Mount of Olives'; both works of much grandeur of style. Not to follow his course too minutely—and to enumerate even the leading pictures of so prolific an artist would require more space than can be spared here—it may suffice to add that 1848 was distinguished by his 'Chancel of the Collegiate Church of St. Paul, Antwerp,' painted for Mr. Vernon, and now with the rest of that gentleman's collection the property of the nation, and that since that time ecclesiastical interiors, with the picturesque features of the Roman Catholic worship as seen in the churches and cathedrals of the Continent, have formed a considerable proportion of the productions of his pencil. In 1849 was exhibited his large painting of 'The Destruction of Jerusalem,' which has since been copied in one of the largest coloured lithographs yet published. In 1850-51 interiors of Belgian churches were his most characteristic contributions; from 1852 to 1854 Vienna, Verona, and Venice were chiefly laid under contribution; but in 1853 also appeared 'The Inauguration of the Exhibition of All Nations—painted by command of her Majesty.' The only picture in 1855 was 'Rome,' but it was one of his largest works in point of size, and noblest in conception and execution. The Imperial city was seen under the influence of the setting sun, and the whole was depicted in a glow of deep sombre colour, and with a simplicity and severity of style which admirably accorded with the character of the scene. His pictures exhibited in 1856 were more diversified and more popular in character: 'Christmas Day in St. Peter's at Rome, 1854'; 'St. Peter's—looking back upon Rome'; 'Venice—Approach to the Grand Canal'; 'Italy'; and 'Monument to Bartolomeo Colleoni, SS. Giovanni e Paolo, Venice.'

Enough has been said to show with how much industry Mr. Roberts has gathered the materials for his pictures, and how much interest they derive from their subjects as well as from the skill with which they are treated. But their interest is heightened by the characteristic circumstances with which the artist associates places which most painters would regard as sufficient in themselves to attract and satisfy the spectator. In the Egyptian views are depicted the halt of a caravan, moslems in their hour of prayer, or some equally striking incident; in the church of the Holy City is shown the assembly of the pilgrims at their great annual gathering; in St. Peter's we see the pope in all the pomp of the most imposing ceremonial of the Romish Church; and all this is done so as to heighten

the general effect of the scene, while the main subject of the picture still retains its unimpaired superiority. As a painter of architectural interiors Mr. Roberts is confessedly without an equal among English painters, and admirable as are some of his Continental rivals in this line of art, we know of none who attain to equal splendour of effect along with equal fidelity. In his architectural exteriors and more extensive scenes he is equally striking, but in them we may still trace the influence of his old theatrical training, in the too palpably artificial and conventional arrangements of groups or single figures, fallen columns, and other foreground objects which admit of strongly contrasted points of light and shadow, and of colour. But these are trifling failings only visible perhaps to a somewhat captious critic; and the most captious may be well content to leave them unquestioned in his admiration of the artist's great technical skill, poetic feeling, fidelity of representation, and refined taste.

ROBERTSON, WILLIAM, was the son of a clergyman who for some time had the congregation in the old chapel of London Wall, and afterwards was one of the ministers of Edinburgh, where Dr. Robertson was born in 1721. His mother was daughter of Pitcairn of Dreghan. In 1743 he was presented to the living of Gladsmuir in East Lothian. He distinguished himself as a preacher, and also as one of the most powerful speakers and most eminent leaders in the General Assembly of the Church of Scotland. In addition to his professional pursuits, he applied himself to historical studies, and in 1759 published his 'History of Scotland during the Reigns of Mary and of King James VI. till his Accession to the Crown of England, with a Review of the Scottish History previous to that Period, and an Appendix containing original Papers,' 2 vols. 4to, 1759. The work was very well received, and went through numerous editions in the author's lifetime. In 1761 Dr. Robertson was made one of the king's chaplains, and in 1762 he was appointed Principal of the University of Edinburgh. Two years after he was made historiographer to his Majesty for Scotland, with a salary of 200*l*. In 1769 he published his 'History of Charles V.' in 3 vols. 4to, a work which raised his reputation still higher, and which, from the general interest belonging to the subject, was very popular; it was immediately translated into several languages. The introductory part consists of an able, though superficial, sketch of the political and social state of Europe at the time of the accession of Charles V., a most important period which forms the connection between the middle ages and the history of modern European society and politics. This part of the work has been much admired for the comprehensiveness of its views, for clearness of exposition and graphic power; but its sweeping statements must often be received with considerable caution. The narrative of the reign and age of Charles is Robertson's master-piece. For his 'History of America,' 2 vols. 4to, 1777, Robertson obtained, through several friends, much valuable information from the Spanish and other archives. In 1785 he published some valuable 'Additions and Corrections to the former Editions of the History of Scotland.'

His celebrity as an author, and the powers which he displayed as a party chief in the Church, where his influence was unbounded, gave rise to a proposition from the court, at the end of George II.'s reign, having for its object his promotion to the dignities of the English Church. This (says his biographer, Dugald Stewart) met with such a repulse as effectually prevented a repetition of the attempt.

In 1791 Dr. Robertson published an 'Historical Disquisition concerning the Knowledge which the Antients had of India, and the Progress of Trade with that Country previous to the Discovery of the Cape of Good Hope.' This agreeable and well written essay is now nearly superseded by more recent works.

Dr. Robertson died at Grange House, near Edinburgh, in June 1793. He is justly reckoned among the best British historical writers. His style is easy and flowing, his language correct, his tone philosophic, his opinions are enlightened and sober, and his expressions temperate. But he was too apt to be satisfied with secondary and common-place authorities, and to put off or evade original investigation, while it must be owned that in his fondness for generalising, and for heightening effect, he sometimes makes statements and describes incidents which are wholly unwarranted by the authorities he cites. Hume, who was his intimate friend notwithstanding the difference of their opinions, greatly extolled Robertson's 'History of Scotland,' and Gibbon has borne ample testimony both to his accuracy and his style.

The works of Robertson were published together in French, 'Œuvres complètes de W. Robertson, précédées d'une Notice par J. A. C. Buchot,' 2 vols. large 8vo, Paris, 1837. Mr. Prescott has lately published a new edition of Robertson's 'History of Charles V.,' with notes and a supplement, embodying much important matter which has come to light since Robertson's death.

ROBERVAL, a French mathematician, whose proper name was GILES PERSONIER. He was born in 1602, at a place called Roberval in the diocese of Beauvais; and having completed an extensive course of study, he went, in 1627, to Paris, where he connected himself with Père Mersenne and other learned men of the age, among whom his talents soon acquired for him considerable reputation. He was chosen professor of mathematics in the college of Gervais, which had been founded by Ramus at Paris, and, together with this appointment, he was allowed to hold, after the death of Morin, the chair of mathematics at the college of France.

The 'Method of Indivisibles,' which forms a link between the ancient geometry and the fluxionary or differential calculus, had been (1635) made public in Italy by Cavalleri, who is always considered as its inventor. In a letter to Torricelli however (1644), Roberval states that he himself had long before that time discovered a similar method of investigating propositions; and he adds, that he kept his processes to himself, in order that he might have a superiority over his rivals in solving such problems as were proposed to them. The statement may be correct; but if so, it happened that the French mathematician, by his reserve, like many others in similar circumstances, lost the honour which he might have obtained; a just punishment, observes Montucla, for those who, from such unworthy motives, make a mystery of their discoveries. At the end of the treatise of Roberval on this subject, there is explained a method of finding the areas of spaces comprehended between curve-lines of indefinite length, and it may be that the credit of the discovery is due to him, though it is right to observe that the investigation of such areas had been made in England by James Gregory and Dr. Barrow before the publication of Roberval's work. Curves with infinite branches, and which admit of an expression for the area between them, were called Robervallian lines by Torricelli.

Roberval discovered an ingenious method of determining the direction of a tangent at any point of a curve-line by the rule for the composition of forces or motions; but he applied it only to the conic sections in which the component forces are supposed to act in the directions of lines drawn from the point in the curve to the foci. It appears that Torricelli laid claim to the first discovery of the method, which he asserts that he had made in 1644; but Roberval states, in a letter to the Italian philosopher, that he was acquainted with it in 1636, and that in 1640 he had communicated it to Fermat.

As early as the year 1616, P. Mersenne suggested the idea of the cycloid, and having made some fruitless attempts to find its area, he proposed the subject to Roberval in 1628; the latter, not succeeding immediately, abandoned the research, and apparently thought nothing of it during about ten years. At the end of that time, the question being revived, he resumed the inquiry with the advantage of greater experience, and fortunately discovered a method by which the area might be determined. Descartes afterwards proposed to Roberval and Fermat to determine the position of a tangent to the cycloid, and Fermat soon resolved the problem, but Roberval appears to have failed, or to have succeeded with difficulty, and only after many trials. He subsequently however discovered the rules for finding the volumes of the solids formed by the revolution of a cycloid about its base and about its axis.

In 1646, Descartes, Roberval, and Huyghens attempted at the same time to investigate the duration of the oscillations made by planes and solids moving about an axis; and here Roberval appears to have been more successful than his competitors, though the state of science was not then sufficiently advanced to allow any of them to attain a solution which should be applicable to every kind of vibrating body.

None of Roberval's works were printed during his life, except a treatise on Statics, which was inserted by Mersenne in his 'Harmonie Universelle.' The others were published by his friend the Abbé Galois, in 1693, among the mathematical and physical works in the old 'Mémoires' of the Academy of Sciences. These relate chiefly to the subjects above mentioned, and include a treatise on the 'Recognition and Construction of Equations,' a work of little utility, since it is formed agreeably to the ideas of Descartes and Fermat, and is expressed in the language and notation of Vieta. Among them also is an account of a new kind of balance (a sort of steelyard) which Roberval had invented, and which was thought to be useful in finding the weight or pressure of the air.

Roberval, unfortunately for his fame, appears among the opponents of Descartes in matters relating to algebra: he is said to have made some objections to the theorems of his countryman in the construction of equations and concerning the nature of the roots; but the objections are without foundation, and serve only to expose his own jealousy and obstinacy.

To Roberval is ascribed the reply, "Qu'est ce que cela prouve?" when, having been present at the representation of a tragedy, some one asked what impression it had made on him. The story is perhaps untrue; but such a circumstance is not improbable, since, in those days, science was profoundly studied, and the mathematicians were so completely absorbed in their pursuits, that they had little time to spare for other subjects. It is said that Roberval could never express his ideas with clearness and precision, and certainly readers well acquainted with the ancient methods of investigation, can with difficulty follow him in his tedious demonstrations. He was elected a member of the Academy of Sciences when the latter was formed (1665), and he died in the year 1675.

ROBESPIERRE, FRANÇOIS-MAXIMILIEN-JOSEPH-ISIDORE, was born at Arras in 1759. His father, a provincial advocate of no reputation, quitted France during the infancy of his children, who were not long afterwards left in a desolate condition by the death of their mother. François Maximilien was the eldest, and Augustin Bon Joseph the second son; the third child was a daughter. Augustin imitated his brother, and perished with him; the daughter lived in quiet respectability, and became a pensioner of the state.

Through the kindness of the bishop of Arras, Robespierre was well educated at Paris. He studied jurisprudence; and having returned to his native town, followed his father's profession, in which he gained some reputation. By his legal talents and his situation as president of the academy at Arras, he obtained an influence, through which, on the summoning of the States-General in 1789, he was elected a deputy of the tiers-état. No sooner was he elected than he went to Versailles to enter on his duties. Within the Assembly, for several months after its meeting, he was of little importance; without its doors, he gradually gained authority by gathering idlers and adventurers round him in the coffee-houses, and haranguing them on liberty and equality. It was by dexterity of address, and the coincidence or adaptation of the opinions which he expressed, to those of his low, discontented, and excited hearers, that this authority was raised. He had no physical advantages to assist him: he was a short insignificant-looking man; his features were small, his complexion was pale, his face deeply marked with the small-pox, and his voice harsh, shrill, and disagreeable. Notwithstanding these disadvantages, he increased in popular estimation. It was on the 17th of June 1789, that he delivered his first speech in the Assembly. From that time he daily threw aside more and more of the backwardness and reserve that he had hitherto maintained: he clearly saw that the weakness and want of energy in the government were so great, that he might with safety assert in the National Assembly the most violent democratic opinions and throw the populace into excitement. His importance in the Assembly was in a great measure attributable to the prominent part which he played in the Jacobin Club. This club already contained so many members, that the large church in which its meetings were held, was continually filled, and it had corresponding affiliated societies throughout the provinces, which disseminated its revolutionary views and projects, and rendered its power most formidable. Here was Robespierre's principal scene of action; here he decried every attribute of monarchy, and denounced those who would control the people, as conspirators against their country. Robespierre laid down this principle, that "France must be revolutionised," and for this object he laboured with a determination which his opponents could find no means of diminishing. It was certain that he could not be tampered with; and the Jacobin newspapers, daily overflowing with his praises, surnamed him "The Incorruptible." His exclusion from the Legislative Assembly, to which he was rendered ineligible by a vote in which he himself had joined, enabled him to devote his whole time and energies to the direction of the Jacobin Club. The violence of the club had somewhat diminished, but its power was increased by the enrolment of many of the municipal officers, who could carry out its projects by their authority. At this time he was named Public Accuser.

When the attack was made upon the Tuileries (Aug. 10, 1792), Robespierre was not present; and for three days afterwards he forsook the club and remained in seclusion. It was his custom neither to take an active part in the great overt acts of massacre or rebellion, nor to appear immediately after their commission; but rather to pause a while, that he might see by what means they might best be turned to the promotion of his political objects and the increase of his own popularity. It was with joy that he saw the National Assembly suspend the royal authority and call upon the nation to elect a convention which should determine on a new form of government. He became a member of the Convention; and on its opening (Sept. 21, 1792), seated himself on the 'montagne,' or higher part of the room, occupied by the most violent, which was also rapidly becoming the most powerful party. It was now that Robespierre first appeared in the foremost rank, which comprised the most powerful men: until now, notwithstanding all his efforts, he had had superiors even in his own party;—in the days of the Constituent Assembly, the well-known leaders of the time; during the continuance of the Legislative Assembly, Brissot and Péthion; and on the 10th of August, Danton. In the first assembly he could attract notice only by the profession of extravagant opinions; during the second he became more moderate, because his rivals were innovators; and he maintained peace before the Jacobins, because his rivals called for war. Now, as we have said, he was in the first rank, and his chief aim was to annihilate the Girondins, who hoped, on the other hand, that the eminence he had attained was insecure as well as high, and that he might be overthrown himself. Barbaroux, Rebecqui, and Louvet dared to accuse him of seeking to be dictator. But the time had not come for accusations to be successful; the tide of his popularity had not turned. He demanded time to prepare his defence, and absented himself for eight days both from the Convention and the Jacobin Club. During this absence the Jacobins protested his innocence and intimidated his accusers, the excitement in the Convention subsided, and on his re-appearance he was triumphantly exculpated.

At this time the king was in prison, but his days were drawing to a close. Robespierre vehemently combated those who either asserted the necessity of a trial or declared the king inviolable: he demanded that he should be beheaded at once, and promoted unscrupulously the execution of his whole family. The death of the king augmented both party strife and private bitterness; each faction and each leader had some rival to destroy. The Montagnards struggled with the Girondins for supremacy, gained their end, and massacred their opponents. The kingdom was chiefly governed by the Committee of Public Safety, of

which Robespierre, Couthon, and St. Just became the triumvirate. Their schemes for a moral regeneration will be found in all the histories of the time, and also an account of Robespierre's presidency at the great public acknowledgment of the existence of a Deity. This took place when his career was nearly run, when there were divisions in the Montagne, where he had lost the support of many who, though they had been rivals, had been likewise powerful allies, when Marat had been assassinated, when he had sanctioned the execution of Péthion and Danton and Desmoulins, when he had put a countless host of victims to death, and raised a proportionate number of enemies. In July 1794, his adversaries became too strong for him: Billaud-Varennes, one of his own party, jointly with the remnant of the Dantonists, who still were furious because of the execution of their leader, accused Robespierre of seeking his own aggrandisement by the sacrifice of his colleagues. In vain Robespierre retired, in vain he took forty days to prepare his defence, in vain he strained every nerve to refute their charges. After a scene of frightful excitement, he was condemned to death, his brother, Couthon, St. Just, and Lebas being included in the same condemnation. Robespierre was separated from the other prisoners, and led to the gaol at the Luxembourg. Here accident gave him a chance of escape. The gaoler, who was his friend, released him; he marched against the Convention with a number of soldiers and partisans, and it is not impossible that he might have re-established his power, if he had possessed courage, and his allies' dexterity. As it was, he was again seized, and having blown his jaw to pieces, in an unsuccessful attempt to destroy himself, was dragged groaning to the guillotine, amidst the taunts and acclamations of the people.

The characters of few men have been more deservedly decried than that of Robespierre. He was totally without any great quality; he was cowardly, cruel, and vain; but he was circumspect, self-reliant, and determined, and above all he was honest in his efforts for the democratic cause, he never sought money, and he well deserved the name of 'Incorruptible.' He long depended on his sister for support, and died worth fifty francs. The powers of his mind, his judgment, and his oratory have been frequently underrated; he must have been at least plausibly eloquent; he chose with adroitness the topics upon which he spoke; he was acute, and had considerable foresight. But on the whole, his low and vile qualities so greatly predominated, that he was not only the terror of the monarchical and aristocratic party, but he likewise injured the democratic cause, for he was guilty of no small portion of that violence and cruelty which rendered a reaction inevitable.

ROBIN HOOD, a personage very famous in our popular poetry. According to what until within these few years may be taken as the received view, he was supposed to have lived in the reign of Richard I. The epitaph, which was said to have been found inscribed on his tombstone near the nunnery of Kirkstrees in Yorkshire, and first printed in Thoresby's 'Ducatus Leodensis' (1714), makes him to have died "24 Kal. Dekembris" (perhaps meaning the 24th of December) 1247. Other copies have "14 Kal. Dekembris," which would be properly the 18th of November. But this pretended epitaph is now generally regarded as a mere fabrication. The Robin Hood of the ballads would appear to have been the most distinguished in his time of those numerous outlaws who under the tyrannical government of the early Norman kings lived in bands in all the great forests, and combined a sort of championship of the cause of the old national independence with the practice of deer-shooting and robbery. The chief residence of Robin Hood and his followers, as is well known, was the forest of Shirewood, or Sherwood, in Nottinghamshire; but he is said to have also frequented Barnsdale in Yorkshire, and according to some accounts, Plumpton Park in Cumberland. "The said Robert," says Stow, "entertained an hundred tall men and good archers with such spoils and thefts as he got, upon whom four hundred (were they never so strong) durst not give the onset. He suffered no woman to be oppressed, violated, or otherwise molested; poor men's goods he spared, abundantly relieving them with that which by theft he got from abbeyes and the houses of rich carles: whom Major (the Scottish historian) blameth for his rapine and theft; but of all thieves he affirmeth him to be the prince, and the most gentle thief." He seems to have been as famous in Scotland as in England, as is evinced by the honourable mention made of him both by Major and by his predecessor Fordun. "The personal courage of this celebrated outlaw," Bishop Percy observes, "his skill in archery, his humanity, and especially his levelling principle of taking from the rich and giving to the poor, have in all ages rendered him the favourite of the common people." His exploits appear to have been a common subject of popular song at least from the time of Edward III., though most of the numerous ballads still extant in which he is celebrated are probably of more recent origin, and, at least in the shape in which we now possess them, are certainly comparatively modern. The 'Lytel Geste of Robin Hood' was printed by Winkyn de Worde about 1495. Of these pieces a complete collection was published by Ritson under the title of 'Robin Hood, a Collection of all the Ancient Poems, Songs, and Ballads now extant, relating to that celebrated English Outlaw,' 8vo, London, 1795. Prefixed to this collection are 'Historical Anecdotes' of the life of Robin Hood, which consist of an accumulation of all the notices respecting the outlaw that the compiler's reading had discovered in manuscripts

or printed books. It cannot be said however that much, or indeed anything, was added to the real facts of his history by this investigation, if it deserve that name. Nothing can be more uncritical than the manner in which the writer jumbles together all sorts of relations about his hero, and builds his chief conclusions on the most unauthoritative testimonies. A source of information upon which he greatly relies is a manuscript in the Sloane Collection in the British Museum, which as evidence really cannot be considered to be entitled to more regard than any other of the various traditional histories of Robin Hood; all of which, as well as it, have indisputably been put together some centuries after the date of the events which they profess to detail. But even this manuscript does not contain what Ritson solemnly sets down as an established fact in his opening paragraph, that Robin Hood's true name was Robert Fitz-ooth, and that he had some claim by descent to the earldom of Huntingdon. It is true he is styled Earl of Huntingdon on the epitaph already mentioned, and some of the old Latin chroniclers speak of him as of noble lineage; but the epitaph, as we have said, is evidently a fabrication, and the account here gravely given of his name and genealogy is founded upon nothing better than a pedigree drawn out by Stukeley, and published in the 'Palaeographia Britannica,' No. 2 (1746), which appears to be a mere joke of that antiquary, or more probably was palmed upon him by some unscrupulous acquaintance—a kind of trick to which his notorious credulity made him peculiarly liable. At any rate the genealogy is as wholly unsupported by any sort of evidence as any pedigree in the Greek or Roman mythology. The ballads about Robin Hood usually describe him as a yeoman. One of these ballads tells us that he was born in the town of Lookley, or Laxley, in Nottinghamshire; and such is also the account of the Sloane manuscript, which moreover assigns his birth to about the year 1160. Ritson therefore sets down this as an ascertained fact; but he at the same time admits that no place so named is now known either in Nottinghamshire or Yorkshire. Of Robin Hood's followers the most celebrated were—Little John (whose surname is traditionally said to have been Nailor); his chaplain, called Friar Tuck, whom some will have to have been a real monk; and his paramour, named Marian. This famous outlaw and archer appears to have been subsequent in date to his countrymen Adam Bell, Clym of the Clough, and William of Cloudeasy, who haunted Eaglewood Forest, near Carlisle, and whose exploits, of the same description with his, have been also a favourite theme of our ballad minstrelsy.

Much attention has been drawn to the history of Robin Hood since the publication of Thierry's 'Histoire de la Conquête de l'Angleterre par les Normands,' in which it was suggested that Robin Hood was in truth the chief of one of the last remaining bands of Saxons who, after the conquest had taken voluntarily to the woods, and there, preserving a sort of military organisation, were able to maintain themselves in a state of continual hostility against their Norman enemies; that Robin, by his superior skill and generous character, had come to be the hero of the serfs and the poor—in other words, of the whole Anglo-Saxon race; and that he flourished in the reign of Richard I., who was actually induced to visit Sherwood Forest by the fame of the outlaw. The theory of M. Thierry was received with some favour; but further investigation has led to wide differences of opinion. A writer in the 'Westminster Review' for February 1840, endeavoured to show that Robin Hood was really one of the adherents of Simon de Montfort, and that, at the head of a party of his followers who were reduced to extremities after the battle of Evesham he took to the woods, and there led the life described. This like the former theory found adherents, but it is, like it, very difficult to harmonise with the whole of the known facts. Widely different is another opinion, the first suggestion of which is due to Germany, whence has come so many fatal blows to the heroes of popular history. In his 'Deutsche Mythologie,' Grimm pointed out certain coincidences between the English Robin Hood and the Robin Goodfellow, Knecht Ruprecht, &c., of the Germans; and, following out the hint, in vol. ii. of his 'Essays on subjects connected with the Literature, Popular Superstitions, and History of England in the Middle Ages,' Mr. Thomas Wright has sought to resolve our 'good yeoman' into a mere myth, "one among the personages of the early mythology of the Teutonic peoples," and about whom the popular stories and fancies have accumulated. But the personality of Robin has found a stout champion in the Rev. Joseph Hunter, the well-known antiquary, who has, in a learned and elaborate dissertation, not only sought to restore the belief that he was really "an outlaw living in the woods and gaining a precarious subsistence there," himself uncommonly skilful in the use of the bow, "and at the head of a company of persons who acknowledged him as their chief;" and that "the whole system of the Robin Hood cycle rests upon a basis of fact and reality, some part of it capable of being brought into light as proved facts, and other parts as being placed among those occurrences which are invested with more or less probability when looked at through the mists which necessarily render obscure the minor transactions of periods so remote, and compel us to be content with having approximated to the true knowledge of them," but further brings evidence to show that he has actually been able to identify the popular hero with one Robert Hood, whose name occurs in the Court Rolls of the Manor of Wakefield in the ninth year of the reign of Edward II. He even goes so far as to place the birth of Robin Hood between 1285 and 1295; and thinks that he took to the forests of

Barnsdale and Sherwood after the fall of the Earl of Lancaster, and remained there in the first instance from about April 1322 to December 1323, when he entered the service of Edward II., but tiring of the constraints of a court life, at the end of a year returned to the woods as described in the ballads. Mr. Hunter's disquisition is a very curious one, and well deserves the perusal of those who may take an interest in "bold Robin;" it forms No. IV. of his 'Critical and Historical Tracts' (1852). The best as well as the most recent edition of the 'Lytell Geste of Robin Hood,' and the other Robin Hood Ballads is that of Mr. J. M. Gutch, 2 vols., 8vo, 1847.

ROBINS, BENJAMIN, a celebrated mathematician and artilleryman, was born at Bath, in 1707, of parents who were members of the Society of Friends, and in such humble circumstances as to be unable to give their son the benefits of a learned education. By the aid however of some occasional instruction and a mind by nature formed to comprehend readily the processes of mathematical investigation, he early attained to a considerable proficiency in the pure sciences; and, as the best means of being enabled to prosecute his favourite studies, he determined to establish himself in London as a private teacher. Some specimens of his skill in the solution of problems having been forwarded to Dr. Pemberton, that learned mathematician conceived so favourable an opinion of his abilities as to encourage him in his design; and accordingly, about the year 1725, Mr. Robins came to town, in the garb and professing the doctrines of a Quaker. The former, after a time, he exchanged for the ordinary dress of the country.

In the metropolis, and apparently in the intervals of leisure which his employment as a teacher afforded, Mr. Robins applied himself to the study of the modern languages, and diligently cultivated the higher departments of science by reading the works of the ancient and the best modern geometers; these he appears to have mastered without difficulty, and in 1727 he distinguished himself by writing a demonstration, which was inserted in the 'Philosophical Transactions' for that year, of the eleventh proposition in Newton's treatise on quadratures. During the following year he published, in a work entitled the 'Present State of the Republic of Letters,' a refutation of John Bernoulli's treatise on the measure of the active forces of bodies in motion, a subject which had been proposed as a prize question by the Royal Academy of Sciences at Paris, and successfully answered by Maclaurin. The foreign mathematician had endeavoured to support the hypothesis of Leibnitz, that the forces are proportional to the squares of the velocities which they produce, while both Maclaurin and Robins were in favour of the original opinion of Descartes, that the forces are proportional to the velocities simply.

About this time Mr. Robins began to make those experiments for determining the resistance of the air against military projectiles, which have gained for him so much reputation. He is said also to have directed the energies of his mind to the construction of mills, the building of bridges, draining marshes, and making rivers navigable; but it does not appear that he was ever employed in carrying such works into execution. The methods of fortifying places became a favourite study with Mr. Robins, and, in company with some persons of distinction, probably his pupils, he made several excursions to Flanders, where he had opportunities of examining on the ground the works of the great masters in the art.

In 1734, the celebrated Berkeley, bishop of Cloyne, author of the 'Treatise on Human Knowledge,' published a small work called the 'Analyst,' in which, without intending to deny the accuracy of the results, it is attempted to be shown that the principles of fluxions, as they were delivered by Sir Isaac Newton, are not founded upon strictly correct reasoning, inasmuch as it is assumed that the ratio between two variable quantities may have a finite or infinite value when the quantities are nascent or evanescent; that is, as the objector supposes, when both quantities become zero. The objection is founded on a misunderstanding of the subject, for by the term nascent or evanescent is meant, not that each quantity is nothing, but that both are infinitely small, or that they are less than anything assignable; in which case one of them may, notwithstanding, exceed the other in magnitude a finite or even an infinite number of times. The talents of both Maclaurin and Robins were employed in answering the objection; and for this purpose Robins published, in 1735, 'A Discourse concerning the Certainty of Sir I. Newton's Method of Fluxions, and of Prime and Ultimate Ratios.' It is easy to imagine however that great difficulty would at first be felt in admitting a principle so different from any which occurs in the ancient geometry; and, before the subject was set at rest, Mr. Robins added to the first, two or three other discourses explanatory of the calculus.

In 1738 he wrote a defence of Newton against an objection on the subject of the sun's parallax which occurs in a note at the end of Baxter's 'Matho;' and, in the following year, he published some remarks on Euler's treatise of 'Motion,' on Smith's 'Optics,' and on Dr. Jurin's discourse concerning vision.

Mr. Robins's principal work, entitled 'New Principles of Gunnery,' was published in 1742. To this is prefixed an account of the rise and progress of modern fortification, and a history of the invention of gunpowder, with a statement of the steps which had been taken towards a knowledge of the theory of gunnery. Having then determined the value of the explosive force of fired gunpowder and the effect of the heat and moisture of the atmosphere on that force, he proceeds to

describe the ballistic pendulum which he had invented, with the manner of employing it in determining the velocities of shot when the guns are charged with given quantities of powder; and he treats at length of the resistance of the air on shot and shells during their flight, a subject till then but little understood. This work had the honour of being translated into German, and commented on by the learned Euler. Some of the opinions advanced in it being questioned by the author of a paper in the 'Philosophical Transactions,' Mr. Robins was induced to reply to the objections, and to give several dissertations on the experiments made by order of the Royal Society in 1746 and 1747; for these he was presented with the annual gold medal. A number of experiments in gunnery subsequently made by Mr. Robins were, after his death, published with the rest of his mathematical works, by Dr. Wilson, and the collection, which makes two volumes 8vo, came out in 1761.

Besides the pursuits of science, Robins appears to have been occasionally occupied with subjects of a political nature. A convention which had been made with the king of Spain, in 1738, respecting the payment of certain claims made by British merchants in compensation for the seizure of their ships and the destruction of their property by the subjects of that monarch, not being considered satisfactory, the opponents of the minister, Sir Robert Walpole, made it the ground of an inquiry into his conduct, and Robins wrote three pamphlets on the occasion. These gained for him considerable reputation, and a committee of the House of Commons being appointed to manage the inquiry, he was chosen its secretary; he did not however hold the post long, as a compromise took place between the opposing parties. About ten years afterwards (1749) Mr. Robins wrote, as a preface to the 'Report of the Proceedings of the Board of Officers on their Inquiry into the Conduct of Sir John Cope,' an apology for the unsuccessful issue of the action at Preston Pans in 1745.

Great difference of opinion exists concerning the share which Mr. Robins had in writing the account of Lord Anson's 'Voyage round the World' (1740-1744). The work was certainly commenced by the Rev. W. Walter, the chaplain of the Centurion, who was in that ship during the greater part of the voyage; but, on the one hand, it is said that the account of the reverend gentleman consisted chiefly of matters taken verbatim from the journals of the naval officers; and that Robins, using the statement of courses, bearings, distances, &c. as materials, composed the introduction and many of the dissertations in the body of the work. On the other hand, we are told that Mr. Robins was consulted only concerning the disposition of the plates, and that he left England before the work was published. It is scarcely probable that a clergyman professing to write the history of such a voyage should have merely copied a sailor's journal, and it may be reasonably supposed that the greater part of the work as it stood in the first edition came from his pen; while, with equal reason, it may be allowed that Mr. Robins added the introduction and the scientific notices. The first edition appeared in 1748, and four were disposed of in the course of that year.

Mr. Robins was offered in 1749 his choice between two good appointments; the first, to go to Paris as one of the commissioners for settling the boundaries of Acadia; and the other, to be engineer in general to the East India Company. He accepted the latter, and departed in December for Madras, where he arrived in July 1750. His intentions were to put the fortifications in a good state of defence, and he had actually prepared plans for the purpose when he was taken ill with a fever. He recovered from this attack, but soon afterwards fell into a declining state, and died on the 29th of July 1751, at the age of forty-four years.

He left behind him the character of being one of the most accurate mathematicians of his age; and the interest which he took in astronomy may be inferred from his having availed himself of his interest with Lord Anson to procure a new mural quadrant for the Royal Observatory at Greenwich, and having taken with him to India a set of instruments for the purpose of making observations in that country. Dr. Hutton relates that in 1741 he was a competitor with Mr. Müller for the post of professor of fortification in the Royal Military Academy at Woolwich; and that the latter succeeded through some private interest in obtaining the appointment.

ROBINS, or ROBYNS, JOHN, an English astronomer and mathematician, who was born in Staffordshire, about the close of the 15th century or the beginning of the 16th, as it appears he was entered a student at Oxford in 1516, and educated for the church. In manuscript (Digby, 143) are preserved several inedited tracts by Robins, and from a note at the end it appears that he was of Merton College. It seems that, in common with many others of that college, he devoted himself to the study of the sciences, and he soon made such a progress, says Wood, in 'the pleasant studies of mathematics and astrology, that he became the ablest person in his time for those studies, not excepting his friend Recorde,' whose learning was more general. Having taken the degree of bachelor of divinity in the year 1531, he was the year following made by King Henry VIII., to whom he was chaplain, one of the canons of his college in Oxford. In December 1543 he was made a canon of Windsor, and afterwards one of the chaplains to Queen Mary, who highly esteemed him for his learning. He died on the 25th of August 1558, and was buried in the chapel of St. George at Windsor. He left behind him several works in manu-

script, of which two, 'De Culminatione Stellarum Fixarum,' and 'De Ortu et Occasu Stellarum Fixarum,' are preserved in manuscript (Digby, 143) in the Bodleian Library. According to Wood, Sir Kenelm Digby also possessed three other tracts by Robyns, viz.: 1, 'Annotationes Astrologice,' lib. iii.; 2, 'Annotationes Edwardi VI.'; 3, 'Tractatus de Prognosticatione per Eclipsin;' and Wood adds that these were also in the Bodleian Library. We suspect Wood is here in error; for in the sale catalogue of the library of George, Earl of Bristol, sold by auction in April 1880, a copy of which is in the British Museum, we find an account of several manuscripts said formerly to have belonged to Sir Kenelm Digby, and among these (No. 49) is 'Johannis Robyns Annotationes Astrologice.' We are inclined to think that Wood may have taken the titles from the catalogue of Thomas Allen's library, in the Ashmolean Museum, nearly the whole of which came into the hands of Kenelm Digby, and that the two titles of 'Annotationes' do in reality belong to the same book. We are not aware that any copy of this work of Robyns's is now in existence, although there are some extracts from it in manuscript (Bodl. 3467), and the loss of it is perhaps not much to be regretted. Wood slightly refers to a book by Robyns, under the title of 'De Portentosis Cometis,' but he says that he had never seen a copy. Bale however mentions having seen one in the Royal Library at Westminster, and this copy is now in the British Museum. Sherburne, in the appendix to his 'Manilius,' mentions another in the possession of Gale, and this is now in the library of Trinity College.—O. i. 11. We find also that there is still another copy in the Ashmolean Museum, manuscript, No. 186. The preface to this latter work, which is partly plagiarised from Cicero, is printed in Halliwell's 'Rara Mathematica,' pp. 48-54.

\* ROBINSON, REV. EDWARD, D.D., was born at Southington, Connecticut, U. S., in 1794. He studied at Hamilton College at Clinton in New York, where he graduated in 1816, and subsequently became teacher of Greek and mathematics. He resigned this office in 1818, and in 1821 entered the theological seminary at Andover in Massachusetts, in which he was in a short time appointed assistant instructor in the department of sacred literature. In 1826 he came to Europe, and studied the oriental languages at Paris and at Halle in Prussia. He then, after a careful course of preliminary study, along with Mr. Eli Smith spent the whole of 1838 in the Holy Land; and the result of their inquiries was given to the world in 1841 in 'Biblical Researches in Palestine, Mount Sinai, and Arabia Petrea;' a work which has done more than any other to fix the sites of places and events recorded in Scripture, and in dissipating the legends which had been erroneously associated with them; and though some of Dr. Robinson's positions have been contested, the learned world has accepted his work as the most reliable that has been yet produced, and for it the Royal Geographical Journal of London bestowed on him their gold medal. In order to decide the controverted points which had arisen as to some of the matters in his former book, Dr. Robinson returned to Palestine in 1851, and has since published 'The Holy Land,' a work which well sustains his previous reputation. On his return to his native country, after the publication of his first work, he was appointed assistant professor and librarian in the theological seminary at Andover, whence he removed to be professor of Biblical literature in the Union Theological Seminary at New York, an office which he yet holds. Besides the works above-mentioned Dr. Robinson has written on various geographical and philological subjects, chiefly in relation to sacred literature. Of these the principal are a translation of the 'Hebrew Lexicon' of Gesenius (1836, fifth edition 1855); a translation of Buttman's 'Greek Lexicon,' 1845, new and enlarged edition 1851; 'Commentary on the Apocalypse,' 1845; 'Critical History and Defence of the Old Testament Canon;' 'Harmony of the Four Gospels in English;' 'Harmony of the Four Gospels in Greek;' 'Dictionary of the Holy Bible;' and 'Historical View of the Languages and Literature of the Slavic Nations,' by Talvj (pseudonym), 1850. He also for a time edited and has largely contributed to the 'Bibliotheca Sacra,' 1843, &c.

\* ROBINSON, JOHN H., an eminent line engraver, was born about 1796 at Bolton, Lancashire. A pupil of James Heath, Mr. Robinson adopted somewhat of that engraver's manner, but he has in his later plates made good his claim to originality as well as refinement of style. Among the best known of his works are the admirable head of Sir Walter Scott from the fine picture by Sir Thomas Lawrence; Wilkie's 'Napoleon and Pope Pius VII.;' Landseer's 'Little Red Riding-Hood,' 'Twelfth Night,' and 'The Mantilla;' Mulready's 'Wolf and Lamb;' and Leslie's 'Mother and Child,' of its kind one of the richest in tone and colour and most delicate in expression of recent English engravings. In our notice of Mr. Doo [Doo, G. T., col. 632] by a slip of the pen we ascribed to that gentleman the fine engraving of the Queen from the portrait by Mr. Partridge: we should have said that he executed the portrait of Prince Albert by Partridge; the companion portrait of the Queen is from the burin of Mr. Robinson, and it is as admirable for high finish and refinement of execution, as that of the Prince is for breadth and vigour; they are unquestionably the finest pair of engravings which have yet been executed of the Queen and her consort. Mr. Robinson has also executed some prints from the old masters, including the well-known 'Flower Girl' by Murillo; he has likewise engraved a good many portraits and other book engravings.

ROBISON, JOHN, was born in 1739, at Boggall in the county of Stirling. His father, who had been a merchant at Glasgow, but who then resided on his estate, intended that he should enter the clerical order, and accordingly he sent him, at eleven years of age, to the university of that city. Here the youth studied the classics under Dr. Moore, and moral philosophy under Dr. Adam Smith; and at the same time he received instructions in mathematics from Dr. Robert Simson. He took his degree of M.A. in 1756; but he declined the Church as a profession.

Being thus compelled to seek an occupation in some other line, he went to London in 1758, with a recommendation from Dr. Simson to Dr. Blair, a prebendary of Westminster, who was then desirous of obtaining some person to instruct the young Duke of York in navigation, and to accompany his royal highness in a voyage to sea, an intention being entertained that the prince should serve in the royal navy. The project was afterwards abandoned, but Mr. Robison consented to embark on board the Neptune with a son of Admiral Knowles, who had just then received his appointment as a midshipman. This ship was one of a fleet destined to co-operate with the land-forces under General Wolfe in the reduction of Quebec; and during the voyage Mr. Knowles being promoted to the rank of lieutenant on board the Royal William, Robison, who was then rated as a midshipman, accompanied him. In May 1759 the fleet arrived in the St. Lawrence, and Mr. Robison was employed in surveying the river and the neighbouring country; at the same time he had an opportunity of making observations concerning the effects produced by the aurora borealis on the magnetic needle. The success of the expedition is well known; and on the return of the Royal William to England, Mr. Robison accepted an invitation from Admiral Knowles to reside with him at his seat in the country.

In 1762, Lieutenant Knowles being appointed to the command of a sloop of war, Robison accompanied him in a voyage to Spain and Portugal; but after being absent six months he returned to England, and quitted entirely the naval service. His friend and patron the admiral however recommended him to Lord Anson as a person qualified to take charge of Harrison's timekeeper, which, after the labour of thirty-five years, was considered fit to be used for the important purpose of determining the longitude of a ship at sea, and which it was proposed by the Board of Longitude to try during a voyage to the West Indies. In consequence of this recommendation, Mr. Robison, accompanied by a son of Mr. Harrison, sailed to Jamaica, where, on January 26, 1763, the chronometer (whose rate had been determined at Portsmouth, November 6, 1762) was found, after allowing for that rate, to indicate a time less by 5" only than that which resulted from the known difference between the longitudes of the two places; and on his return to England, 2nd of April 1763, that is, after an absence of 147 days, the whole error was found to be but 1' 54½".

Mr. Robison, being disappointed in his expectations of promotion from the Admiralty, set out for Glasgow in order to resume his studies. Here, enjoying the friendship of Dr. Black and Mr. Watt, the former of whom was on the point of developing his theory of latent heat, and the latter of bringing forward his great improvements on the steam-engine, he felt himself irresistibly impelled towards the pursuit of the physical sciences. On the removal of Dr. Black to Edinburgh, Mr. Robison was appointed to succeed him, and for four years he gave lectures on natural philosophy at Glasgow; but at the end of that time he accepted (1770) the appointment of secretary to Admiral Sir Charles Knowles, who had been invited by the Empress of Russia to superintend the improvements which that sovereign contemplated making in her navy. Two years after his arrival at St. Petersburg Sir Charles became president of the Board of Admiralty, and Robison was made inspector of the corps of maritime cadets at Cronstadt, with a liberal salary and the rank of lieutenant-colonel in the Russian service. He gave no instructions, but his duty was to receive the reports of the masters, and to class the cadets in the order of their merits; this he performed for four years, but finding Cronstadt a dreary place of residence during the winter, he accepted the professorship of natural philosophy at Edinburgh, which had become vacant by the death of Dr. Russel. He arrived in that city in June 1774, bringing with him two or three of the Russian cadets, whose education he had undertaken to superintend; and in the same year he gave a series of lectures on mechanics, optics, electricity, astronomy, &c. This course he continued to deliver annually during the rest of his life, except when ill health obliged him to appoint a substitute for the purpose, improving each subject from time to time by the introduction of every important discovery which it received from the researches of his contemporaries. The lectures are said to have been distinguished by accuracy of definition and clearness as well as brevity of demonstration; and the experiments by which they were illustrated, to have been performed with neatness and precision. But it has been objected to them that they were delivered with a rapidity of utterance which made it difficult for the students to follow him; that he supposed his pupils to possess a higher degree of preparatory information than they had in general attained, even when they had gone through the university course of study, and that the experiments were too few in number to serve the purpose intended by them.

On settling in Edinburgh, Mr. Robison became a member of the

Philosophical Society of that city. In 1785 he was attacked by a disorder which was attended with pain and depression of spirits, but he was only occasionally prevented from performing his duties and following his literary avocations. In 1798 he was made Doctor in Laws by the University of New Jersey, and in the following year by that of Glasgow; and in 1800 he was elected a foreign member of the Academy of Sciences at St. Petersburg. In 1785 he wrote a paper, which was published in the first volume of the 'Philosophical Transactions of Edinburgh,' on the determination, from his own observations, of the orbit and motion of the Georgium Sidus; and he afterwards wrote one which appeared in the second volume of the same work, on the motion of light as affected by reflecting and refracting substances which are themselves in motion. But his most important works are the numerous articles which, in 1793 and the following years, he contributed to the third edition of the 'Encyclopædia Britannica' and its 'Supplement'; a series of treatises which may be considered as forming a complete body of physical science for that time.

Mr. Robison was prevailed upon to superintend the publication of Dr. Black's lectures on chemistry, and they came out in 1803; but that science had undergone so great a change since the death of the learned lecturer, that the work excited little interest. In the following year he published a portion, containing dynamics and astronomy, of a book entitled 'Elements of Mechanical Philosophy;' but the substance of it, together with that of some MSS. which had been intended by the author to form part of the second volume, and also the principal articles which had been written for the 'Encyclopædia Britannica,' were collected by Dr., now Sir David, Brewster, under the title of 'A System of Mechanical Philosophy,' and published in 1822, with notes, in 4 vols. 8vo.

While Mr. Robison was on his journey to Russia in 1770, he was hospitably entertained by the Bishop of Liège, who, with all his chapter, constituted a lodge of freemasons; and into this society our traveller was induced to enter. It is unknown from what source he obtained his information respecting its proceedings, but twenty-nine years afterwards he published a remarkable work containing 'A History of the German Illuminati,' whom he describes as the agents in a plot formed by the freemasons to overturn all the religions and governments of Europe. The work met with little attention, and Robison was charged with a degree of credulity scarcely to be expected in a person so well acquainted with the laws of philosophical evidence.

Having taken a slight cold, and suffered an illness of only two days' duration, Mr. Robison died on the 30th of January 1805, in the sixty-sixth year of his age, leaving a widow and four children. He is stated to have been a person of prepossessing countenance, a good linguist, a draughtsman, and an accomplished musician; and it is added that his conversation was both energetic and interesting.

ROBORELLO, FRANCIS, was born of a noble family, September 9th, 1516. He was educated at Bologna under the celebrated Romulo Amaseo, and he began about 1538 to teach the belles lettres at Lucca. Five years afterwards he went to Pisa, where he lived during the next five years, and laid the foundation of his fame, which was soon spread over the whole of Italy. In 1549 the senate of Venice elected him successor to Battista Egnazio, professor of rhetoric there, whose advanced age obliged him to retire from public duties. In 1552 Robortello was promoted to the chair of Greek and Latin literature in the University of Padua, in the place of Lazaro Buonamici, who died in that year. Thence he removed in 1557 to Bologna, in order to undertake a similar office in that city. Having been appointed to pronounce here the funeral oration in honour of the Emperor Charles V., who died in 1558, he is said to have forgotten the exordium, and to have been incapable of proceeding, which brought him into some disrepute. About this time he had violent disputes with Sigonius, in which Robortello appears to have been the aggressor, and which did not terminate till the senate of Venice employed their authority in imposing silence upon both. Robortello died at Padua, March 18, 1567, in the fifty-first year of his age, so poor that he did not leave enough to defray the expenses of his funeral, which however was celebrated by the university in a style of great magnificence.

Robortello seems to have been naturally pugnacious, and he was continually involving himself in disputes with men superior to himself. He could not refrain from attacking such writers as Erasmus, Paulo Manuzio, Muretus, and Henry Stephens. He was however a man of considerable talent and learning, and he published several books of great utility. The following are his principal works:—1, 'Variorum Locorum Annotationes tam in Græcis quam in Latinis Auctoribus,' 8vo, Venice, 1543; 2, 'De Historicâ Facultate,' &c., 8vo, Florence, 1545, being several treatises on Greek and Roman literature, all of which are inserted by Gruter in his 'Thesaurus Criticus'; 3, 'De Convententiâ Supputationis Livianæ Annorum cum Marmoribus Romanis quæ in Capitolio sunt; De Arte sive Ratione corrigendi Veteres Auctores Disputatio,' folio, Padua, 1557; 4, 'De Vitâ et Victu Populi Romani sub Imperatoribus Cæs. Augustis,' folio, Bologna, 1559. Besides these he published editions of Aristotle's 'Poetics,' the 'Tragedies' of Æschylus, the 'Tactics' of Ælian, and Longinus 'On the Sublime.'

ROBUSTI, JACOPO. [TINTORETTO.]

ROCHEFOUCAULD, FRANÇOIS, DUC DE LA, of a distinguished

noble family of France, was born in 1618. He appeared early at the court of Louis XIII., and showed some talents and ambition, but was kept out of employment and favour by the jealousy of Cardinal Richelieu. In the early part of the subsequent reign of Louis XIV. he figured in the civil war of La Fronde. He attached himself to the party of the Duchess of Longueville, whose avowed admirer he was, and he was severely wounded at the siege of Bordeaux, and in the battle of St. Antoine at Paris. After Louis XIV. had firmly established the monarchical authority, La Rochefoucauld withdrew to private life. In this second part of his career he exhibited private virtues which atoned for the folly and violence of his younger years. He was intimate with Madame de la Fayette, and with Madame de Sévigné, who speaks of him in her correspondence in terms of real esteem. He died in 1680, with calm and Christian-like resignation. The Cardinal de Retz, his contemporary and fellow-partisan, in his 'Mémoires,' says of him, that he was always irresolute in his temper; a good soldier, with no military talent; a bad courtier, though ambitious of figuring and meddling in intrigue; but at the same time he praises "his natural good sense, the ease and mildness of his manners," and says that "he was a very upright man in private life." La Rochefoucauld left several works, the principal of which are—"Mémoires de la Régence d'Anne d'Autriche;" and his 'Maximes,' or 'Pensées,' for which he is best known as an author. This book has made much noise in the world; it has been abused, criticised, controverted, and yet no one can deny that there is a great deal of truth in it, though it generalises too much. La Rochefoucauld attributes all the actions of men, good or bad, to the moving-spring of self-interest. Friendship is an exchange of good offices, generosity is the means of gaining good opinion, justice itself is derived from the fear of suffering from the oppression of others. This may be all true, but still there are actions in which men can have no self-interest in view, in which they act from enthusiasm, or a strong sense of duty, or from benevolence, or some motive other than self-interest; such are, for instance, the self-devotedness of the patriot, the perseverance of the upright man through good and evil report, the sacrifice made by pure love, and, above all, the calm resignation of the Christian martyr. These and other similar instances La Rochefoucauld has not taken into account, because probably he had seen no specimen of them. La Rochefoucauld has accounted for most actions of a great proportion of mankind, perhaps by far the greater, and for so doing he has been abused, because, as a French lady observed, he has told everybody's secret. He has placed himself, with regard to private morality, in the same predicament as Machiavelli with regard to political morality. [MACHIAVELLI.] J. J. Rousseau, who was certainly not free from selfishness, has abused La Rochefoucauld's 'Maximes;' and yet in his 'Emile' he observes that "selfishness is the main-spring of all our actions," and that "authors, while they are for ever talking of truth, which they care little about, think chiefly of their own interest, of which they do not talk." La Fontaine, in his fable (b. i., 11) 'L'Homme et son Image,' has made an ingenious defence of La Rochefoucauld's book.

La Rochefoucauld's 'Maximes' have gone through many editions. The 'Œuvres de La Rochefoucauld,' 1818, contain, besides his already published works, several inedited letters and a biographical notice.

Several other individuals of the same family have acquired an historical name, among others, LOUIS ALEXANDRE DE LA ROCHEFOUCAULD, peer of France, who embraced the popular part at the beginning of the great French revolution, and displayed considerable violence in his sentiments, notwithstanding which, after the 10th of August, he was massacred by the Jacobins as an aristocrat.

ROCHESTER, LORD. [WILMOT.]

ROCKINGHAM, CHARLES WATSON WENTWORTH, MARQUIS OF, was the only son of the first Marquis of Rockingham, and was born on the 13th of May 1730, two years after the title of Baron of Malton had been conferred upon his father, who, in 1734, was advanced to the dignity of Earl of Malton, and, having succeeded to his cousin in the barony of Rockingham in 1746, was created Marquis of Rockingham the same year. The Watsons, barons, and for some time earls of Rockingham, had originally acquired importance by the marriage of one of them with the sister of the great Earl of Strafford, whose vast estates they in this way came to inherit.

In September 1750, while his father was still alive, the subject of the present article was created Earl of Malton in the Irish peerage; but before the end of the year his father's death left him in possession of the marquise. Young as he was when he thus entered the House of Lords, he did not wait long before beginning to take a share in debate. Horace Walpole, in his 'Memoirs of the Last Ten Years of the Reign of George II.,' notices one or two of his earliest appearances in not very complimentary terms. When what was called the Scotch Bill (for planting colonies of foreign Protestants on the forfeited estates in Scotland) was under discussion in March 1752, he says, "The young Marquess of Rockingham entered into a debate so much above his force, and partly applied the trite old apologue of Menenius Agrippa, and the sillier old story of the fellow of college, who asked why we should do anything for posterity, who had never done anything for us!" Again, in his account of the debates in the following February, about the charge of Jacobitism brought against the solicitor-general Murray (Lord Mansfield) and other persons connected with the court, he notes, in the same sarcastic style:—"Lord Northum-

berland, perceiving it was a day for great men to stand forth, thought it a good opportunity to announce his own dignity; but he said little to the purpose. Still less was said by the young Marquess of Rockingham, though he had prepared a long quotation from Tacitus about informers, and opened with it."

But although never rated high as a man of talent, the mere wealth and independent position of the marquis necessarily secured him great influence, which was much strengthened by his upright and honourable character in private life, as well as by the moderation and consistency of his political conduct, although that was no doubt partly owing to the very narrowness of his understanding, which prevented him from ever looking beyond the particular set of notions he had originally taken up, or the particular people from whom he had received them. He had been educated in the principles of what was then considered constitutional Whiggism, and he evidently to the end of his life never entertained a doubt about the truth of his political opinions. In February 1760 he was made a Knight of the Garter. His political career from this date forms part of the history of the next reign, and of the several persons of much greater mark than himself with whom he was brought into association or collision in the fluctuating contest of parties. [GEORGE III.; BURKE; PITT.] He was first lord of the treasury and prime minister from the 10th of July 1765 to the 12th of July 1766, and was again placed at the head of affairs with the same office on the resignation of Lord North, in March 1782, but died the 1st of July of that year. The Marquis of Rockingham married, in 1752, the daughter of Thomas Bright, Esq., of Badsworth, but had no children. His eldest sister was married in 1744 to the first Earl Fitzwilliam, whose son, having succeeded to the family estate on the death of the marquis, took the surname of Wentworth in 1807.

RODERIC, the thirty-fourth and last of the Visigothic line of kings who filled the throne of Spain from 411 to 711. The circumstances which attended the elevation and fall of this prince are as doubtful as most events of that dark period. He appears to have been the son of Theodofred, duke of Cordova, and the grandson of Chindaswind. Having been entrusted by Witiza with the command of the army, Roderic revolted against his sovereign in 708, deprived him of the crown, and banished him to Toledo. For some time after his usurpation, Roderic had to contend against the sons and partisans of the dethroned monarch, who had taken refuge in the northern provinces of Spain. At last the sons of Witiza, perceiving their inability to cope with the forces of the usurper, crossed over to Africa, where they were kindly received by Ilyan (the Count Don Julian of Spanish chronicle), lord of Ceuta and Tangiers, and a friend of Witiza, who offered, if assisted by the Arabs, whose tributary he was, to restore the princes to the dominions of their father. Having communicated his project to Músa Ibn-Nosseyr, then governor of Africa for the Kalifs of Damascus [MUSA IBN-NOSSEYR], that general, who had long wished to carry his arms into Spain, gladly embraced the opportunity offered to him, and promised his powerful assistance. By his orders Tarif Abú Zorah, with four hundred Berbers, landed at Tartessus (since called Tarifa, in commemoration of this event), and after ravaging the adjoining country, returned to Africa laden with plunder and captives. This happened in Ramadhán, A.H. 91 (Oct. A.D. 710). The success of the enterprise filled the Arabian Amir with joy, and a second and more formidable expedition was, the ensuing year, directed against the shores of Spain, on Thursday the eighth of Rejeb, A.H. 92, answering to 30th April, 711. Tárik Ibn Zeyrá, a freed man of Músa Ibn Nosseyr, landed with eight thousand men at the foot of the rock of Calpe, to which he gave his own name, 'Jebel Tárik' (the mountain of Tárik), since corrupted into Gibraltar. Soon after their landing, Tárik and his followers were attacked by Theodomir, the governor of Andalusia. The Goths however were unable to force the positions taken up by Tárik, who, seeing his number daily increase by fresh reinforcements from Africa, descended into the plain, and advanced without opposition as far as Medina Sidonia. He was there met by Roderic, who, at the head of numerous but ill-disciplined forces, hastened to repel the invasion. After some sharp skirmishing, which lasted for six consecutive days, the two armies came to a general engagement on the 5th of Shawwál, A.H. 92 (26th July, 711). According to Ar-rázi and other historians, this memorable battle, which decided the fate of the Gothic monarchy, was fought on the banks of the river Barbate, not on those of the Guadalete, as the generality of the Christian historians have erroneously asserted. It was at first hardly contested on both sides, until the defection of Oppas and other partisans of Witiza, to whom Roderic had imprudently entrusted the command of the right wing of his army, gave the victory to the Arabs. The rout then became general, and the flower of Gothic chivalry fell by the sword of the Arabs, Roderic himself being in the number of the slain.

This last fact has been brought into question by the generality of the Spanish historians, from Rodericus Toletanus down to Masedu, on the ground that Sebastianus Salmanticensis, a monk and chronicler of the 10th century (in 'Flores, Esp. Sag.' vol. xiii.), speaks of a tomb being discovered in his time, at Viseo in Portugal, bearing this inscription, 'Hic requiescit Rodericus ultimus Rex Gothorum'; from which they conclude that Roderic escaped the field of battle, and retired into Portugal, where he passed the remainder of his days in penance and prayer. The statement however is entitled to little credit; for not only have we the testimony to the contrary of the

Arabian writers, who universally agree that Roderic perished in the action, though they are divided as to the manner of his death, some asserting that he was slain by Tárik, and others that he was drowned in attempting to cross the river; but the assertion is further corroborated by Isidorus Pacensis, and the anonymous continuator of the 'Chronicon Biclarense'—two contemporary Christian writers, who positively declare that Roderic died in the action. Roderic's reign had lasted nearly three years. There is a fabulous chronicle of this king, or rather a romance of chivalry, in which the popular traditions current among Moors and Christians respecting the invasion and conquest of Spain, as well as many ridiculous fables like that of Florinda, and the enchanted Tower of Toledo, have been embodied by an anonymous writer of the 14th century. It was printed for the first time at Toledo, 1549, and has since gone through several editions. Another fabulous history of Roderic and the events in which he was engaged, was written towards the middle of the 16th century, by a converted Moor of the name of Luna (Granada, 1592, &c.). These, and other books of the same stamp, have furnished ample materials for some admirable works in recent English literature, by Scott, Southey, and Irving.

(Al-makkari's *History of the Mohammedan Dynasties in Spain*, vol. i, chaps. 1 and 2.)

RODNEY, ADMIRAL, LORD. GEORGE BRYDGES RODNEY was born at Walton-upon-Thames, in the county of Surrey, February 19, 1718. He was taken from Harrow School, and sent to sea at twelve years of age. In 1739 he was made a lieutenant; in 1742, a captain; and in 1748 he was sent out as governor and commander-in-chief on the Newfoundland station, with the rank of commodore. In October, 1752, Rodney returned to England, and was elected member of parliament for the borough of Saltash. He was appointed successively to the Fougueux, 64 guns; the Prince George, 90 guns; and the Dublin, 74. After twenty-eight years of active service, he was raised to the rank of rear-admiral, May 19, 1759.

In 1761 Admiral Rodney was appointed commander-in-chief at Barbadoes and the Leeward Islands. Having captured the islands of Martinique, Santa Lucia, and Granada, he was recalled on the conclusion of peace in 1763. Soon after his return he was created a baronet, and by successive steps reached the rank of vice-admiral of the red. He was also appointed governor of Greenwich Hospital; but resigned this office on being sent out, in 1771, as commander-in-chief on the Jamaica station. In 1774 he was recalled.

Under the pressure of pecuniary difficulties, Sir George Rodney now retired to Paris, where he remained till May, 1778, when he was promoted to the rank of admiral of the white, and in the autumn of 1779 was again appointed commander-in-chief on the Barbadoes station, for which he sailed December 29, 1779. His fleet consisted of 22 sail of the line and 8 frigates. France and Spain were at this time united against England. Before he had been ten days at sea he had captured seven Spanish ships of war, and on the 16th of January, 1780, fell in with a Spanish fleet, under Admiral Langara, near Cape St. Vincent, consisting of 11 ships of the line, and 2 frigates. Of these five were taken and two destroyed; but the action being in the night, and the weather tempestuous, the rest escaped.

On the 17th of April 1780, Rodney came in sight of the French fleet, under the Comte de Guiche, near Martinique. Rodney intended to attack the enemy, which was a little superior, with his fleet in close order; but the greater part of his captains disobeyed, and kept at a cautious distance. Only five or six ships supported him, while in his own, the Sandwich, he engaged a 74 and two 80-gun ships for an hour and a half, and compelled them to bear away, and broke through the enemy's line. In his despatches Rodney censured the conduct of his captains, but the Admiralty suppressed the passage, and only one of them was brought to trial, who was dismissed from the service. The admiral was rewarded with the thanks of the House of Commons, and a pension of 2000*l.* a-year, to be continued after his death to his family in specified portions for their respective lives. In 1780 he was chosen, free of expense, to represent the city of Westminster, and was also made a Knight of the Bath. Soon afterwards war was declared against the states of Holland, and instructions were sent to Rodney to attack their possessions in the West Indies. The Dutch island of St. Eustatius surrendered, without a shot having been fired, February 3, 1781; and in the course of the spring, the Dutch colonies of Demerara, Essequibo, and Berbice were taken. Rodney, having returned to Europe in the autumn of 1781 for the recovery of his health, was received with universal enthusiasm, was created vice-admiral of England, in the place of Admiral Hawke deceased, and was appointed to the command of the whole of the West Indies. Both the French and Spanish fleets were at this time in the West Indies, and it was intended to form a junction and attack Jamaica and the other British possessions. The French fleet was commanded by the Comte de Grasse, and consisted of thirty-three or thirty-four sail of the line, besides frigates. Intelligence having been brought to Rodney, on the 8th of April 1782, of their having sailed from Fort Royal Bay, Martinique, he immediately followed them. A partial action took place on the 9th, when two of the French ships of the line were disabled, and a third was rendered useless by an accident in the night of the 11th, thus reducing the French fleet to thirty or thirty-one ships of the line. The British

fleet was rather more in number, but much less in weight of metal. The general action commenced on the 12th of April 1782, at seven o'clock in the morning, and lasted till half-past six in the evening. Rodney, in the *Formidable*, broke through the French line, and engaged the *Ville-de-Paris*, De Grasse's flag-ship, and compelled her to strike. The result was, that seven ships of the line and two frigates were taken by the British.

About this time the Whigs had come into office, and Rodney having been always opposed to them, an officer was appointed to succeed him, who had only just sailed when the news of this great victory reached England, and the Admiralty immediately sent an express to overtake and bring back the officer, but it was too late. Rodney reached England, September 21, 1782. He was raised to the peerage with the title of Baron Rodney, and received an additional pension of 2000*l.* a-year. He lived chiefly in the country, till May 23, 1792, when he died, in his seventy-fifth year. He was twice married, and left a numerous family. A monument was erected to his memory in St. Paul's Cathedral, London, at the national expense. His portrait by Reynolds was in the royal collection at St. James's Palace, but has since been sent to Greenwich Hospital.

(Mundy, *Life and Correspondence of Lord Rodney*, London.)

RODRIGUEZ, VENTURA, the most eminent Spanish architect of the eighteenth century, was born at Cienpozuelos, July 14, 1717, and commenced his first studies in his profession under Esteban Marchand, who was then employed on the works carrying on at Aranjuez. After the death of Marchand, in 1738, he still continued at Aranjuez, until Juvara engaged him as his assistant in making drawings for the design of the new palace at Madrid; and after the death of Juvara, he was similarly engaged by his successor Sachetti, with whom he was subsequently associated in the execution of that vast pile, as *aparejador*, or principal clerk of the works, 1741. In 1747 he was made honorary member of the Academy of St. Luke at Rome; and on that of St. Fernando being established at Madrid, in 1752, he was appointed chief director or professor of architecture in it, an office for which he was peculiarly fitted, not only by his talents, but by his zeal for his art, and his solicitude for the improvement of the pupils. Commissions poured in upon him from every quarter; for there was scarcely a work of any importance throughout the country on which he was not either engaged or consulted. He was employed on various cathedrals, churches, colleges, hospitals, and other structures at Zaragoza, Malaga, Toledo, Granada, Valladolid, and numerous other places; and a mere list of the works designed or executed by him would be one of considerable extent. We can here merely point out, as being among the more remarkable for their design, the sanctuary at Cobadonga, the church of San Felipe Neri at Malaga, that of the hospital at Oviedo, and the palace of the Duke de Liria at Madrid.

These multiplied engagements, and the frequent journeys which they occasioned him, prevented his visiting Italy; but he collected all works of engravings relative both to its ancient and modern buildings. He also carefully studied the various monuments of Roman, Moorish, and Gothic architecture in his own country. He died at Madrid in 1785, in his sixty-eighth year, and was buried in the church of San Marcos, the only one in that capital erected by himself. Rodriguez has been honoured with an *Elogio* by the celebrated Jovellanos, to which we must refer those who wish for a more detailed notice of his character and works. He is also repeatedly mentioned with high commendation by Ponz, in his '*Viage de España*;' and he doubtless deserves the title he received from his contemporaries, of the Restorer of Architecture in Spain.

ROEBUCK, JOHN, M.D., the son of a Sheffield manufacturer, was born in 1718. He received a liberal education at Northampton under Dr. Doddridge, and subsequently in the University of Leyden, and settled in Birmingham as a physician. Pursuing an early taste for chemistry, he introduced some improvements in the processes of refining gold and silver, and established, in connection with Mr. Samuel Garbet, an extensive refinery and chemical manufactory at Birmingham. He there effected such improvements in the manufacture of sulphuric acid (formerly called vitriolic acid, or oil of vitriol), by the use of leaden instead of glass vessels, and by other modifications of the process, as enabled him to reduce its price from sixteenpence to fourpence per lb., and thus to render it available for many new and important purposes in connection with manufactures; and, in conjunction with Mr. Garbet, he established, in 1749, vitriol-works at Preston-pans for the purpose of bringing these improvements into practice, thereby rendering a great service to our rising manufactures, and securing to himself and his partner a handsome return. He is said to have tried bleaching with sulphuric acid, but the subsequent introduction of this valuable process does not appear to be traceable to his experiments. Abandoning his medical practice, Roebuck henceforward resided chiefly in Scotland, where he perfected improved methods of smelting and manufacturing iron with pit-coal instead of charcoal, and founded the great iron-works at Carron, for which he chiefly designed the furnaces and machinery, calling in the aid of Smeaton, and subsequently of Watt. The first furnace at this great establishment, the formation of which constitutes an era in the history of British manufactures, was blown on the 1st of January 1760. Unfortunately for himself, Roebuck subsequently became the lessee of extensive coal and salt-works at Borrowstouness, belonging to the

Duke of Hamilton. For the carrying on of these works, on which he employed nearly a thousand persons, he was obliged to withdraw his capital successively from his other undertakings, and he nevertheless became so involved as to derive only a bare subsistence from the collieries, although his improved modes of working were highly beneficial to the country. While engaged in this speculation he became connected, as stated under JAMES WATT, with some of the early experiments of the author of the modern steam-engine, in the first patent for which he had a share. He died on the 17th of July 1794. In a copious memoir in the fourth volume of the '*Transactions of the Royal Society of Edinburgh*,' of which he was a Fellow, he is stated to have been the author of a few papers read before that and the Royal Society of London, and to have published two political pamphlets.

\*ROEBUCK, JOHN ARTHUR, M.P., was born at Madras in 1801. He was the son of E. Roebuck, Esq., of that place, who was the son of the eminent Dr. Roebuck of Birmingham, the subject of the preceding article. Mr. Roebuck can also trace his descent from the poet Tickell. When very young Mr. Roebuck went to Canada, whence he came over in 1824 to become an English barrister. He was called to the bar at the Inner Temple in 1831, and went on the Northern circuit. He is now a Queen's Counsel and a bencher of the Inner Temple. In 1832 he was returned as member for Bath to the first Reformed House of Commons; and since that time he has been known as one of the 'advanced liberals' of that House, and as one of the most resolute and effective advocates of the various measures which from time to time have formed or still form the policy of the party so designated. He sat for Bath till 1837, having in the meantime (1834) married a daughter of the Rev. Thomas Falconer of Bath, who is known as an author, and as having been Bampton lecturer at Oxford. During this early part of his parliamentary career, Mr. Roebuck made his reputation as one of the chiefs of what has been called the 'school of philosophical radicalism,' in which capacity he was also a contributor to the '*Westminster Review*' in its early days. He was agent in England for the House of Assembly of Lower Canada in the actual time of the Canadian rebellion, and zealously defended the interests of the colony in her dispute with the executive. At this time also he won that character for independence and incorruptibility, touched with something of asperity, which he has ever since retained. As a Radical he was very severe on the Whigs, both in parliament and out of it; and he had a quarrel which led to a duel with Mr. Black, editor of the '*Morning Chronicle*,' the Whig journal. His hostility to the Whigs cost him his seat in 1837; but he was again elected for Bath in 1841, and continued to represent it till the general election of 1847, when he was again thrown out. He was first returned for Sheffield—which constituency he still represents—in May 1849, and then without opposition.

As member for Sheffield, Mr. Roebuck has kept up his peculiar character as an independent critic of the proceedings of all parties from the point of view of an extreme patriotic liberalism. Occasional ill-health has interfered with his parliamentary labours; but he has taken a prominent part in many important debates, and he almost always brings a large amount of valuable and suggestive information to bear upon the subject in hand, and he enforces it, notwithstanding his feeble physical powers, with much energy. He has also on one or two occasions originated important motions. It was he who, in January 1855, moved for inquiry into the conduct of the Russian war, and by carrying the motion against the Aberdeen government by a large majority, forced that government to resign. Mr. Roebuck acted as chairman of the celebrated committee of inquiry appointed in pursuance of his motion. In December 1855 Mr. Roebuck was a candidate for the office of chairman of the new Metropolitan Board of Works, but he was third in the list of candidates when the final vote was taken. He has since then become chairman of the Administrative Reform Association, founded by some merchants of London and others after the exposures of the state of our administrative machinery to which the inquiry into the Russian war led. The association, after starting with great promises, was thought to fail in accomplishing its aspirations; and Mr. Roebuck has recently been trying to re-invigorate it and give it distinct practical aims. Mr. Roebuck is also chairman of the Western Bank of London, and also of the Acadian Charcoal-Iron Company of Nova Scotia. Mr. Roebuck, besides his scattered letters, manifestoes, &c., and his contributions to the '*Westminster*' and '*Edinburgh*' Reviews, &c., is the author of the following separate works:—'*Pamphlets to the People*,' 1835; '*The Colonies of England: a Plan for the Government of some portion of our Colonial Possessions*,' 1849; and '*The History of the Whig Ministry of 1830 to the passing of the Reform Bill*,' 2 vols., 1852.

ROELAS, JUAN DE LAS, one of the most distinguished of the Spanish painters, commonly known among Andalusian artists as El Clerigo Roélas, was born at Seville of a distinguished family, about 1558 or 1560: his father, Pedro de las Roélas, was a Spanish admiral, and died in 1566. Roélas is styled in documents and in books '*el licenciado Juan*,' which signifies probably merely that he was a graduate of the University of Seville. Little is known about his education: he is supposed to have studied in Italy, and from his style with some of the scholars of Titian in Venice. In 1603 he painted four pictures for the college of Olivares. From 1607 until 1624 he lived chiefly at Seville and Madrid; and in 1616, after the death of

F. Castello, he was a competitor for the place of cabinet painter to the king, Philip III.; notwithstanding the "many years' service of Roélas's father," however, Bartolomé Gonzalez succeeded Castello. Roélas settled in Olivares in 1624, when he was appointed one of the canons of the college, but he died there in the following year, April 23rd, 1625. Francisco Zurbaran was the scholar of Roélas.

The works of Roélas are very numerous in Seville; and there are still many in the College of Olivares, and there are some at Madrid. His master-piece is the death or 'el Tránsito' of San Isidoro, in the church of that saint at Seville; this is a large majestic composition, in two compartments, similar to the communion of St. Jerome by Domenichino, and other Italian pictures, but on a larger scale. In the lower part is the archbishop in a church in the attitude of prayer and about to die, supported and surrounded by his numerous clergy, among which are some magnificent heads; in the upper part of the picture is our Saviour on his throne, with the Madonna by his side, and surrounded by angels; the attention of all is directed to the dying saint. This picture, it appears, has never been engraved; indeed, very few good Spanish pictures have been engraved, and it is owing to this circumstance that the great painters of Spain are so little known out of their own provinces. One of his best works also is the Saint Iago, in the Capilla de Santiago, in the Cathedral of Seville: the saint is riding over Moors; it was painted in 1609. Bermudez speaks of it as full of fire, majesty, and decorum. According to Mr. Ford ('Handbook of Spain'), it is surpassed by the picture of the Conception, by Roélas, in the Academy; and by three in the chapel of the University of Seville—a 'Holy Family, with Jesuits,' a 'Nativity,' and an 'Adoration.' "No one," says this writer, "ever painted the sleek grimalkin Jesuit like Roélas." Pacheco, who was censor of pictures in Seville [PACHECO], reproached Roélas with want of decorum in a picture, in the Merced Calzada, of 'St. Anne Teaching the Virgin to Read,' for representing some sweetmeats and some articles of common domestic life upon a table in the picture; and also for painting a sheet, intended to wrap the infant Saviour in, who is naked, in the picture of the 'Nativity,' in the chapel of the university.

Roélas is compared with Tintoretto and the Caracci; he is the best of the Andalusian painters in design and composition, and displays frequently a grandeur of form and majesty of character which belong only to the greatest masters: in colouring also he may be compared with the Venetians. His last picture is apparently the 'Nativity,' at Olivares. Palomino's account of this painter is almost wholly incorrect; he calls him Doctor Pablo de las Roélas.

(Cean Bermudez, *Diccionario Historico*, &c.)

ROGER OF HOVEDEN. [HOVEDEN.]

\* ROGERS, HENRY, now Professor of Philosophy at Spring-Hill Independent College, Birmingham, and well known as an English Essayist, and the author of works designed to exhibit the harmony of Philosophy and Revealed Religion, was educated at Highbury College, and was for some time an Independent preacher. The duties of this office not agreeing with his health, he resigned his charge. He was afterwards for a time Professor of the English Language and Literature in University College, London. Thence he removed to his present situation.

Within the last ten or fifteen years Mr. Rogers, by his contributions to the 'Edinburgh Review,' has won himself the high place which he occupies in the contemporary literature of Britain. Probably since Mr. Macaulay ceased to write for the 'Edinburgh,' Mr. Rogers has been the most distinguished of its regular contributors in the kinds of topics formerly treated by Mr. Macaulay in the pages of that periodical. His articles have been numerous and on very various subjects—some critical, some historical or biographical, and some speculative. A collection of them was republished in 1850 under the title of 'Essays,' selected from Contributions to the Edinburgh Review. This collection, increased in bulk by an additional volume published in 1855, has passed through more than one edition. It is by these three volumes of republished 'Essays' that Mr. Rogers is best known; but he is also the author of 'The Life and Character of John Howe, M.A., with an Analysis of his Writings,' 1836; of 'General Introduction to a Course of Lectures on English Grammar and Composition,' 1838; of a well-known work on the present state of religious opinion entitled 'The Eclipse of Faith,' and of a 'Defence' of that work, published in 1854 in reply to Mr. Francis Newman. Mr. Rogers officiated, along with Mr. Isaac Taylor, as Examiner of the Essays given in for the Burnett prizes of Aberdeen in 1854, and awardee of the prizes.

ROGERS, SAMUEL, was born on the 30th of July 1763, at Newington Green, a suburb of London. His father, who was a Dissenter, and much respected by the Dissenters of London, was a banker by profession; and the poet, after a careful private education, was placed, when yet a lad, in the banking-house to learn the business prior to his becoming a partner. Among his reminiscences of this time was that of Wilkes calling at the banking-house to solicit his father's vote, and, as his father was out, shaking hands with him as his father's representative. From a very early period, the future poet exhibited a taste for letters, and he used to date his first determination towards poetry from the effect produced upon him by reading Beattie's 'Minstrel,' when a mere boy. His admiration of literature and literary men led him, while still a clerk in his father's bank, to

meditate a call on Dr. Johnson for the purpose of introducing himself; and once, with a young friend, he went to Johnson's house in Bolt Court bent on accompanying the object, but his courage failed him when he had his hand on the knocker. It was in 1786—two years after Johnson's death—that Rogers, then in his twenty-third year, published his first volume of poetry, under the title of 'An Ode to Superstition, and some other Poems.' The date is important. "The commencement of a new era in British Poetry," says a critic, "dates almost exactly from this year. For a year or two before 1786, there had been manifestations of a new poetic spirit, differing from that of the poetry of the 18th century as a whole, and more particularly from that of Darwin, Hayley, and the Della Cruscan who represented the poetry of the 18th century in its latest and dying stage. Crabbe, for example, had published his 'Library' in 1781; and Cowper had made his first distinct appearance as a poet in 1782, when he was already in his fifty-second year. Crabbe's 'Village' was published in 1783, and Cowper first made an effective impression by the publication of his second volume, including his 'Task,' in 1785. Thus Rogers was heard of as a poet almost at the same time as Crabbe and Cowper. But more exactly contemporary with Rogers than either Crabbe or Cowper, was Robert Burns, the first edition of whose poems appeared in that very year, 1786, which saw Rogers's *début* as an author." In short, Rogers's first appearance as a poet coincides with the opening of that era in our literature in which we still are, and of which Rogers himself is one of the minor stars.

Shortly after his first publication, Rogers travelled in France, where he saw Condorcet and many other men afterwards celebrated in the French Revolution. He also visited Scotland, where he saw Adam Smith, Dr. Robertson, and other celebrities. In 1792 he published his 'Pleasures of Memory,' by which, and by a subsequent volume containing 'An Epistle to a Friend and other Poems,' published in 1798, he "established his place among the men of letters who adorned Great Britain in the closing decade of the last century." During the next fourteen years he gave nothing new to the world, either to increase or to mar his reputation. It was during this long interval of silence that he retired from his hereditary business as a banker (though with an income still derived from the bank, and with the nominal character of partner continued to him) to enjoy, by means of his ample wealth, a leisure absolutely at the command of his private tastes. "The house of Rogers in St. James's-place," it is said, "became a little paradise of the beautiful, where, amid pictures and other objects of art, collected with care and arranged with skill, the happy owner nestled in fastidious ease, and kept up among his contemporaries a character in which something of the Horace was blended with something of the Mæcenæas." As he had known Fox, and Horne Tooke, and Dr. Price, and Dr. Priestley, and Lord Nelson, and others of the eminent men of the former generation, so now he gathered round his table the political and social, and literary and dramatic celebrities who had succeeded them—Wordsworth, Scott, Byron, Coleridge, Mackintosh, Southey, Wellington, Chantrey, &c., &c. His own political sentiments were those of moderate Whiggism, but this did not prevent men of all parties from being his guests.

In 1812, Rogers, when his muse seemed dead, added to a republication of his earlier poems, the fragment entitled 'Columbus.' He was then in his fiftieth year. In 1814 his 'Jacqueline' was published in conjunction with Byron's 'Lara,' this being the period of the height of the intimacy between the two so dissimilar poets. "Composed with the same laborious slowness, and polished line by line to the same degree of smoothness," says the writer of a sketch of his life, "his 'Human Life' appeared in 1819. Finally, as the last and much the longest of his productions, came his 'Italy,' the first part of which was published in 1822, in the poet's sixtieth year, and the complete edition of which, illustrated, under the author's care, at an expense of 10,000*l.* by Stothard, Prout, and Turner, did not appear till 1836. With the preparation of this exquisite book his literary career may be said to have closed. He still wrote an occasional copy of verses at the rate of a couplet a week; and some of these trifles, including one written as late as his ninety-first year, are preserved in his collected works. But on the whole it was in his character as a superannuated poet, living on the reputation of his past performances, drawing the artists and wits, and men of rank of a more modern age around him, and entertaining them with his caustic talk, and his reminiscences of the notable persons and events of former days, that he figured in a select portion of London society during the last twenty years of his existence." The longevity of the poet was, indeed, one of the sources of the public interest felt for him in his later life. Always fond of open air exercise and of going to public exhibitions, he might be seen strolling about in the parks, or in a stall or box at the opera, to within a few years of his death. An accident in the streets at last disabled him from walking out; but the extraordinary tenacity of his constitution enabled him to recover from it, when a younger man might have died. It was not till the 18th of December 1855, when he was in his ninety-third year, and had already for many years been the literary patriarch of his country, that he departed this life. Wordsworth and many others who had been born after him, and had attained old age under his view, had predeceased him, and left him alone among a generation of juniors.

Rogers will be remembered partly for his poetry, and partly from

the peculiar connection in which he stood, in virtue both of his longevity and his social position and habits, with the miscellaneous phenomena, and especially with the art and literature of his time. His poetry is of the highly finished and tasteful rather than the powerful kind. "We have in his works," says a critic, "a classic and graceful beauty; no slovenly or obscure lines; fine cabinet pictures of soft and mellow lustre, and occasionally trains of thought and association that awaken or recall tender and heroic feelings." His relations to his time were less those of active influence than those of shrewd observation and interesting reminiscence. They are best exhibited in the volume of his 'Table Talk,' published, since his death, by his friend Mr. Dyce.

\* ROGET, PETER MARK, an eminent physician and physiologist. He graduated in medicine at Edinburgh in 1798, and practised in Manchester, where he obtained the appointment of Physician to the Infirmary, Lunatic Asylum, and Fever Hospital. He subsequently came to London, where he became known for his scientific taste, and was elected a Fellow of the Royal Society. He was afterwards made Secretary to the Royal Society, an office which he held for many years. On the foundation of the University of London, he was appointed, a member of the Senate, and was for some years one of the examiners in physiology. He was early elected one of the Fullerian Lecturers on Physiology at the Royal Institution of Great Britain. He was the writer of one of the Bridgewater treatises, under the title 'Animal and Vegetable Physiology.' This work was published in 1834. He has contributed extensively to the general scientific literature of the day. The treatises on 'Electricity' and 'Magnetism,' in the Library of Useful Knowledge, were from his pen. He contributed the article on the Deaf and Dumb to the 'Encyclopædia Britannica,' and the articles 'Age' and 'Asphyxia' to the 'Cyclopædia of Practical Medicine.' In 1838 he published a 'Treatise on Physiology and Pneurology.' In 1839 he delivered the Gulstonian Lectures at the Royal College of Physicians, which were published in the 'Medical Gazette.' Besides these larger works, he has published many papers on medical and scientific subjects in the 'Transactions of the Medico-Chirurgical Society,' in the 'Philosophical Transactions of the Royal Society,' in the 'Proceedings of the Royal Institution,' and other publications.

Dr. Roget is a Fellow of the Royal College of Physicians, and Consulting Physician to the Queen Charlotte Lying-in Hospital, and the Northern Dispensary. He is also a Fellow of the Astronomical, Geological, Zoological, and Entomological Societies.

ROHAULT, JAMES, was the son of a merchant at Amiens, where he was born in 1620. He received the rudiments of a scientific education in that city, and was afterwards sent to Paris for the purpose of prosecuting his studies in philosophy.

In that age the physical works of Aristotle had begun to give place to those of Descartes, and most of the learned men in France received with complacency the explanation of the phenomena of Nature which were given in the 'Principia,' the 'Dioptrice,' and the 'Meteoræ' of their illustrious countryman. Rohault was one of those who diligently studied the writings of the Greek philosopher and of his numerous commentators, but who also applied himself with ardour to the productions of the new school, of which he professed to be a zealous disciple. This circumstance appears to have brought him to the notice of Clerselier, who, being himself a warm Cartesian, conceived so great a regard for the young philosopher, that he gave him his daughter in marriage, and engaged him to write a commentary on the works of the man who was the object of their common admiration. Rohault seems to have executed the task assigned to him in a manner which gratified the wishes of his patron and father-in-law, and in the spirit of an enthusiastic follower; for in the preface to his 'Traité de Physique' he designates Descartes as a man who, by his works, had shown that France was capable of forming philosophers as illustrious as those of ancient Greece. This work was translated into Latin by Dr. Samuel Clarke, and published with notes, in which are given explanations of the principal phenomena agreeably to the philosophy of Newton, which, in a very few years, had entirely supplanted that of the French school.

After the above-mentioned work was finished, Rohault appears to have been occupied for several years in giving instructions in mathematics, and the subjects of his lessons were published after his death in two volumes. The course comprehends geometry, both plane and practical; trigonometry, plane and spherical; fortification, mechanics, perspective, and arithmetic.

Besides the 'Traité de Physique,' Rohault published also a work entitled 'Entretiens sur la Philosophie,' consisting of a series of dialogues, in which the subjects are treated according to the Cartesian principles. He died in 1675.

ROLAND, MANON. MANON PHILIPON, for such was her maiden name, was born in Paris in 1756. Her father was an artist of moderate talent; her mother was a woman of superior understanding and of a singularly amiable temper. Manon learned to read so early and so easily as not to be able to recollect the process; and, having once learned to read, she read everything that came in her way. In her father's house she enjoyed to a certain extent the means of cultivating painting, music, and general literature. Whilst yet a girl she was, at her own earnest request, placed for one year in a conventual school. At this age her religious enthusiasm was extreme; in after-years it subsided, and her opinions, she confesses, went through every change until they

rested in scepticism—a result in some degree due to her course of reading. Her reading, under her father's roof, was in fact of a most miscellaneous description. The works of the fathers and the free writings of the 17th and 18th centuries were equally accessible to her, and perused with equal avidity; but the most powerful and lasting impression was made on her by an early familiarity with Plutarch's 'Lives of Illustrious Men.' From this time Greece and Rome were constantly present to her thoughts, and when she was fourteen years old she is said to have wept to think that she was not a Roman or a Spartan woman.

At the age of five-and-twenty she became the wife of M. Roland, a man twenty years her senior, of laborious habits, great ability and integrity, and manners described as of antique severity. A daughter was the fruit of this marriage, and Madame Roland's time became divided between the care of her child's education and giving assistance to her husband, from whose knowledge she derived great advantage in return. He held the office of Inspector of Manufactures, of which he fulfilled the duties in a liberal spirit, well acceding with the previous impressions of his enthusiastic partner. With him Madame Roland visited England, Switzerland, and other countries of Europe, everywhere industriously inquiring into the nature of the civil institutions, and manifesting the warmest sympathy with the advocates of political liberty. On witnessing the comforts enjoyed by the English cottagers, she is said to have observed, that in this country a handful of wealth did not constitute the nation, but that man, whatever his station, was reckoned as something.

The intense interest with which such a woman regarded the first movements of liberty in her own country, may easily be conceived. Her husband being appointed to represent the city of Lyon in the National Convention, left his residence near that city, and, accompanied by his wife, proceeded to Paris, where the curiosity of Madame Roland was gratified, and her zeal, if possible, increased, by the opportunity of observing some of the most distinguished actors on the political stage—as Mirabeau, Cazalès, Maury, Barnave, and others of less note. To the cause espoused by these notable persons Madame Roland and her husband were warmly attached; and, during the ministry of the party of the Gironde, Roland was appointed minister of the interior, for which his information, his assiduity, and his strict probity highly qualified him. It was, whilst holding this office, that he appeared at court with a round hat and strings to his shoes; and was regarded by the courtiers as a symbol of a monarchy about to fall. His sincere language was as unwelcome to the court as his plain attire was displeasing to the courtiers. The talents of his wife were at this time applied to assist him in the composition of public papers. Without pretending to direct him, she avows her belief that by mingling with the severer accents of patriotism the expressions and feelings of a woman of sensibility, she rendered these documents more impressive and effectual. The famous letter of M. Roland to Louis XVI. (May, 1792) was drawn up by her: a letter designated, according to the political feelings of the readers, as an enlightened although a severe remonstrance, or as audacious and full of evil prophecy. This production occasioned M. Roland's dismissal by the court; for which he was compensated by the warm applauses of the Convention. He again became a minister after the events of the 10th of August; but his party had then passed the bounds prescribed by his judgment, and entered upon extremes repugnant to his high-minded and generous wife. Still they were apparently favoured by their party, to whom Roland's character and popularity were necessary. Amidst the real and affected grossness of dress, manners, and language of the republicans, society preserved its respectability in the circle assembled round the table of the minister of the interior.

The events of the reign of terror do not require to be detailed. The frightful massacres in the prisons of Paris on the 2nd and 3rd of September, were boldly denounced by Roland in his capacity as minister; but the Convention, which applauded him, wanted courage, or virtue, or power to act upon his advice; and from that hour his own doom and that of his wife became only more certain. Madame Roland had herself been already arraigned before that assembly, on an absurd charge of treasonable correspondence with England; and by her presence of mind, her acuteness, and her wit, had baffled and mortified her accusers. The recollection of this defeat is said to have so haunted the minds of Marat, Danton, and Robespierre, that in every subsequent difficulty and in every attack made upon their proceedings, they imagined they recognised the boldness, sagacity, or sarcasm of Madame Roland. She and her husband began to receive warnings of their danger, and for a short time consented to take the precaution of not sleeping at the Hôtel of the Interior. The appearance of deception was little agreeable to Madame Roland. "I am ashamed," she said, on an occasion on which she had almost consented to leave her house in the dress of a peasant, "of the part I am made to play. I will neither disguise myself nor leave the house. If they wish to assassinate me, it shall be in my own home. This courageous example is due from me, and I will afford it." Her husband quitted Paris, and she might have done so, but she declared that the care of evading injustice cost her more than it would do to suffer from it.

The time arrived when the intellectual superiority hitherto maintained in the Convention by M. Roland's party, or the Girondists, was overcome by absolute force. Forty thousand men were marched

against the Convention, by the Jacobins, on the 31st of May 1793; and in the evening of the same day Madame Roland was arrested and thrown into the prison of the Abbaye. Here she displayed her usual firmness, and continued to exercise towards the poor and unfortunate a benevolence for which in her prosperous days she had been remarkable. Before her friends she appeared cheerful; she always maintained the language of a patriot when speaking of the aspect of affairs, flattering and fearing none; and she professed herself capable of overcoming her ill-fortune. In solitude the feelings of the wife and the mother overcame her, and the attendants remarked that she passed many hours in tears. Her sufferings were greatly aggravated by her being one day unexpectedly liberated, as if the danger was past. She drove home with extreme delight; sprung out of the coach, as she says it had always been her habit to do, but with more than usual vivacity; and was running gaily up stairs, when she was again arrested by an officer, and at once taken to Sainte Pelagie, a prison of a lower order than the Abbaye, where she was shut up with the worst of her sex. In this second prison she remained until her trial and execution. The only explanation given of this circumstance was that her first arrest had been illegal. The wretchedness of her situation at Sainte Pelagie was only alleviated by her literary occupations, and by the kindness of her gaolers or of their families, whom her fascinating manners and behaviour converted into friends. Well knowing that her life would be sacrificed, she devoted all her hours to the composition of her 'Memoirs,' writings full of lively description, entertaining anecdotes of her contemporaries, and remarks indicative of penetration and habitual reflection. A letter to her daughter, written in these circumstances, is one of the most affecting of farewells. But Madame Roland seldom gave way to melancholy emotions in her writings. Her pages detail the events of her childhood and youth with matchless sprightliness and grace; and, excepting in certain passages wherein candour is carried to an excess which modern delicacy would not permit to a female writer, her 'Memoirs' are models of that kind of composition.

As the narrative advances, events of a deeper interest are related with great facility of expression, sometimes with mournful pathos, generally with great judgment, not always without satire, but always with easy eloquence. From a very early age we may discern in this relation the extraordinary decision of her character, her naturally commanding manners, her fervent but well-controlled temperament, her indefatigable love of improvement, and her unswerving adherence to truth.

Several unhappy prisoners delivered themselves from certain execution by taking poison; and Madame Roland had at one time resolved to do the same. But communicating her resolution to a friend, who represented to her that a nobler course would be to wait for death, and leave the memory of so great a sacrifice to the cause for which she had lived, she calmly determined to abide the result.

It was in the month of October (1793) that the Girondists were destroyed. On the 31st of that month she was sent to the Conciergerie. On the 10th of November she appeared before the revolutionary tribunal. She had declined the proffered aid of M. Chauveau-Lagarde, the advocate of the Girondists, of the unfortunate queen, and of Charlotte Corday; knowing that no talents could save her, since her innocence could not, and not wishing to expose him to useless danger. Part of the night was occupied by her in writing an eloquent defence. Her courage did not desert her during her trial or at her execution. She sustained the insults of the unmanly tribunal, not without womanly emotion, but also with a dignity worthy of the greatest women of the times with which her early reading of Plutarch had made her familiar. To the last moment she preserved her presence of mind, and even her gaiety. On the same day and at the same hour a man was also to be guillotined; and in such extremity to die first being thought a privilege, she waived it in favour of her less courageous companion in misfortune; overcoming the scruples of the executioner, whose orders were to execute her first, by representing to him the impoliteness of refusing a woman's last request. It is said that bending herself before the statue of Liberty, close to this scene of death, she exclaimed, "Oh! Liberty: what crimes are committed in thy name!"

She had often been heard to say that her husband would not survive her. As soon as he heard of her execution, he took leave of two attached female friends in whose house, at Rouen, he had found a refuge, and to whom his resolution was known; walked in the evening of the 15th of November as far as Baudouin, four leagues on the road to Paris; sat down by the side of a tree in an avenue leading to a private house, and passed his cane-sword through his chest. By his side was found a paper, in which these words were written:—"Whoever you are who find me lying here, respect my remains; they are those of a man who devoted his whole life to being useful, and who died, as he had lived, virtuous and honest."

ROLLE, MICHEL, a French mathematician, was born at Ambert in Auvergne, in 1652. He appears to have possessed from nature a remarkable facility in solving propositions relating to arithmetic and algebra, and to have acquired by practice a great proficiency in the calligraphic art. After having served during several years as an attorney's clerk, he went, in 1675, to Paris, where he obtained a subsistence as a writing-master, and where he spent his leisure time in cultivating the mathematical sciences. An accidental circumstance

procured for him the notice of M. Colbert. Ozanam, who was himself a good analyst, happening to propose to mathematicians a problem of the kind called indeterminate, which, he conceived, could be solved only by a process involving very high numbers, Rolle was so fortunate as to discover a neat solution; and the minister, being informed of it, was induced, in 1685, to recommend him for election as a member of the Academy of Sciences, then recently formed.

From this time Rolle devoted himself to analytical pursuits, and in 1690 he published a treatise on algebra in 4to. This work contains, among other methods for the solution of equations, one which he calls the method of 'cascades,' a name given to it because it consists in successively depressing the equation one degree lower at each operation. It has some analogy to a method given by Newton in the 'Arithmetica Universalis,' but its want of generality has caused it ever since to be neglected. An affectation of peculiar modes of expression prevails throughout the whole work, which is otherwise very obscurely written: the author was however particularly skilful in the management of questions of the kind called diophantine, and he published a treatise on that subject in 1699.

Rolle, unfortunately for his fame, entered the lists as an opponent of the algebra of Descartes, and of the differential calculus which had been then recently discovered by Newton and Leibnitz; and he is accused of using towards those who endeavoured to point out his mistakes a tone of anger which is very unbecoming in a philosopher. He began in 1701 to attack the differential calculus, objecting both to its principles and its applications; and, with respect to the latter, he endeavoured to show that in particular examples the results are inconsistent with those which are brought out by the ancient processes. The new calculus, as it was called, found however in France a zealous and temperate advocate in Varignon, who, in replying to the objections of Rolle, explained the true meaning of the differential symbols, and pointed out that the supposed discrepancies in the results of the examples arose entirely from the haste and inadvertency of the objector.

This dispute agitated the French Academy of Sciences for a long time, Rolle continuing to raise one objection after another; and though they were answered by Varignon, the former always pretended to have the victory. It is said that the Academy was then composed of men who had been long accustomed to the ancient analysis, and therefore saw with pleasure an opposition raised against methods to which they were not yet reconciled. In 1705 however the Academy, without pronouncing a judgment on the subject, recommended that Rolle, in moderating his language, should conform to the rules of the institution; and the dispute was for a time terminated. This was twenty-nine years before Bishop Berkeley attempted to revive the subject in the 'Analyst.' [ROBINS.]

It appears that subsequently Rolle acknowledged his error, and thus he may be supposed to have deserved the pardon of posterity. He was admitted second geometrical pensioner of the Academy in 1699, and died on the 5th of July 1719, at sixty-seven years of age.

ROLLIN, CHARLES, born at Paris, on the 30th of January 1661, was the second son of a master cutler, and was intended by his father for the same trade. Attracting the notice of a Benedictine monk, by the taste and aptitude for learning which he showed at a very early age, he was rescued from his obscure destiny, and placed at the college of Plessis with a pension. Here he pursued his studies with great zeal, industry, and docility, was much noticed by the principal of the college, and was selected by the minister, Le Peletier, as the companion of his two sons, with whom he had disputed the prize of academic distinction in generous rivalry. After having been instructed in humanities and philosophy, he devoted three years to the study of theology at the Sorbonne. At the age of twenty-two he had distinguished himself so much in the college of Plessis, that Hersan, the professor of rhetoric there, pointed him out as his own successor in the professorial chair, which he wished to vacate; and Rollin, in spite of his own diffidence, was made his assistant in 1683, and professor in his stead in 1687. The next year he received the additional honour of the professorship of eloquence in the Royal College. In both these capacities he did not disappoint expectation. The orations which he delivered in public were very correct and elegant Latin compositions; and the reforms and regulations introduced by him into the discipline of the university deserve much praise. He revived the study of Greek, which had been greatly neglected; gave more prominence to the cultivation of the French language in the course of general instruction; introduced the plan of learning by heart fine passages of different authors, as an exercise of taste and memory; and substituted exercises in the room of the dramatic representations which the scholars had been in the habit of performing. In 1694 he was appointed rector of the university, in which office he continued two years, and made himself remarkable not less for his constant attention to its internal management than for his zeal in maintaining its privileges against all attempts to impair them.

At the expiration of the rectorship he was engaged by Cardinal Noailles to superintend the studies of his nephews, having resigned all his public employments, except the professorship of eloquence in the Royal College, in order that he might have more leisure for his private literary labours. Shortly after he was drawn from his retirement, and

unwillingly persuaded to become coadjutor in the college of Beauvais. In this situation he passed fifteen years, devoting himself with as much assiduity to the improvement of the system of education there as he had before done in the college of Plessis. In consequence of the disputes between the Jesuits and Jansenists, which latter party he was thought to favour, and the intrigues thence arising in his college, Rollin was compelled to quit his office at Beauvais. In 1715 he published his edition of Quintilian, in 2 vols. 12mo, with a preface and a popular outline of rhetoric, short notes, and summaries of the chapters. The text was not published entire, but selections were made according to the judgment of the editor.

In 1720 he was again chosen rector of the university, but in consequence of the religious feuds already mentioned, he was displaced very shortly by a *lettre-de-cachet*, the university being desired to choose a more moderate rector. From this period till his death he seems to have withdrawn from public life as much as possible, and devoted himself to study, the fruit of which was given to the world in several works. In 1726 appeared his '*Traité de la Manière d'Etudier et d'Enseigner les Belles-Lettres*,' a work which presents a popular view of such classical and French literature as he considered suited for the instruction of the young, and contains such a system of education as his own experience in teaching had suggested. This treatise, though deficient in philosophical principles, and inferior to subsequent writings of the same nature, was well adapted for the age in which it was published, and contributed probably very much to diffuse a general taste for literature throughout France. It was translated into English in 1735, under the title of '*Thoughts concerning Education*, translated from the French.' Encouraged by the general approbation with which this publication was received, Rollin composed his '*Histoire Ancienne*,' an account of the chief nations of antiquity drawn from profane authors, and terminating with the establishment of the Roman empire under Augustus, in thirteen volumes, which appeared successively in the interval between 1730 and 1738. His last work was a '*History of Rome*,' which was afterwards continued by Crevier, from the end of the republic to the time of Constantine, in completion of the original plan.

Rollin's latter years were disturbed occasionally by the religious troubles which agitated his country. His friendship with many distinguished Jansenists drew upon him from time to time the suspicions of the government, and he was accused of joining in conspiracies, and his house searched in consequence, though his enemies could not succeed in criminating him. He died 14th September, 1741, having exceeded his eightieth year.

From the testimony of his contemporaries it appears that Rollin's character was a model of piety and virtue. He was remarkable for his liberality, modesty, integrity, and single-heartedness. This last quality is shown not less in the whole tenor of his actions than in his writings, which please more from a certain simplicity than from any other cause. The merits and defects of his '*Belles-Lettres*' are of the same kind as those observable in his '*Histoire Ancienne*.' There is the same want of profound thought, and the same absence of critical judgment, the same easy style, attractive to a young mind, and pleasing from its very carelessness, while the want of critical judgment is compensated by the love of truth and the morality which pervade the whole. Great praise has been bestowed on Rollin by his contemporary admirers, among the most illustrious of whom were the Duke of Cumberland and Frederic the Great, who was his frequent correspondent. Montesquieu styled him 'the bee of France,' and Voltaire and Rousseau have confirmed this eulogium. Modern readers will perhaps think that Rollin's merits as an author have been overrated by the zeal of personal friendship and esteem for his private character, and that his works are chiefly valuable as having contributed to form the taste and strengthen the moral feelings of his age. His '*Opuscules*' were collected and published, 2 vols. 12mo, in 1771; they contain orations and poems, written in very classical and graceful Latin, correspondence with Frederic the Great, Rousseau, and other distinguished persons, and other smaller compositions.

Extracts from his works, by M. l'Abbé Lucet, were published in 8vo, Paris, 1780, under the title of '*Pensées sur plusieurs points importants de Littérature, de Politique, et de Religion*.' He is said to have written a '*History of the Arts and Sciences of the Antients*,' London, 3 vols. 8vo, 1768. His '*Histoire Ancienne*' has frequently been reprinted. A new edition of all his works was commenced at Paris, 8vo, 1837. This history was edited by Emile Beres, with new maps and plates.

ROMAGNOSI, GIAN DOMENICO, was born near Piacenza in 1761. He studied first in the College Alberoni, where he had for a schoolfellow his countryman Gioia, who afterwards distinguished himself as a publicist and a political economist. [GIOIA, MELCHIORRE.] Romagnosi continued his studies at Parma, where he took his degree of Doctor of Law in 1786. He afterwards practised as an advocate. In 1791 he published his '*Genesi del Diritto Penale*,' being an investigation of the grounds on which the infliction of punishment for offences is founded. Beccaria, Filangieri, and other Italian jurists of that age, had adopted the French theory of a social contract, by which each member of incipient societies was supposed to have given up a portion of his original independence into the hands of the collective body, and to have thus bound himself and his descendants. Romagnosi rejected

this hypothesis, and he derived what he called the right of punishing from the principle of necessity and of self-defence, inasmuch as the whole of society is concerned in an injury which is done to any of its members. His work was well received in France and Germany, but it has been little noticed in Italy until of late years, where it has been republished several times; and it is now much studied, especially in Tuscany. Soon after the publication of the work, the Prince-Bishop of Trent named him prætor, or chief magistrate, of that town, an office held for one year, but in which Romagnosi was confirmed for three consecutive years, after which the bishop named him his aulic councillor.

During the turmoil of the French revolution, Romagnosi did not participate in the admiration of many of his countrymen for what were called the new ideas, and he tried to define the just meaning of liberty and equality in two little works, '*Che Cosa è Eguaglianza*,' '*Che Cosa è Libertà*,' 1793. When the French invaded Italy in 1796, Romagnosi remained in the Italian Tyrol, to whose population he was greatly attached: he said of them, among other things, that they did not know how to tell a lie. When the French entered the Tyrol, Romagnosi was named secretary of the provisional council instituted at Trent, in which capacity he did all he could to alleviate the evil of foreign invasion. When the French were driven away in 1799, he was accused by some invidious person of disaffection to his legitimate sovereign, and was arrested and confined at Innsprück; but he was soon released, and the Emperor Francis himself declared him innocent, and banished his accuser. In December 1802 he was appointed professor of law in the University of Parma, where he published his second professional work, '*Introduzione allo Studio del Diritto Pubblico Universale*,' a treatise on general jurisprudence. Romagnosi maintained that moral and political science is as susceptible of demonstration as the natural and metaphysical sciences. He took for the basis of his system the principle of moral necessity, saying that men and society tend not only to their preservation, but to their physical and moral improvement, in the quickest and at the same time safest progression. This progression can only be effected by raising the intellectual and moral powers. The understanding and the heart ought to be educated so as to create only wishes and habits consistent with the general welfare, and so that utility and justice shall coincide. A second edition of Romagnosi's work appeared at Milan in 1825, with the addition of five letters by the author to Professor Valeri of Siena, in which he develops and illustrates his principles.

In 1806 Romagnosi was requested by the government of the so-called kingdom of Italy, then under Napoleon I., to repair to Milan, in order to assist other distinguished jurists in compiling a code of criminal procedure. Romagnosi attended all the sittings of the Commission in which the draught of the new code was discussed. He wished to introduce the jury; but Napoleon put his veto on it, saying that he did not think that the state of Italy allowed of such an institution. Some one proposed to introduce into Italy the '*lettres-de-cachet*,' or royal orders for imprisoning individuals for state reasons without trial, which existed in France under Napoleon as well as under the old monarchy; but Romagnosi strenuously opposed the measure. Perceiving much coldness among his colleagues on the subject, he told them that the crosses and decorations which they wore on their breasts produced on them the effect of Medusa's head: finally he carried his point. He had also the merit of introducing into the code the heads '*rehabilitation*' and '*revision of trials*.' The code, as revised by Romagnosi and his colleagues, was adopted, and published under the following title, '*Codice di Procedura Penale del Regno d'Italia*,' 8vo, Brescia, 1807. In France it was praised by Cambacères. The suggestions of Romagnosi during the discussion of the code were published separately under the title '*Ultime e più necessarie Aggiunte e Riforme al Progetto del Codice di Procedura Penale*,' Milano, 1806.

Romagnosi was likewise employed in the compilation of a penal code for the kingdom of Italy, which however never became law. In consequence of the numerous revisions to which it was subjected, and the dilatoriness of the Italian ministers, the project had not reached Paris when Napoleon asked for it. Finding that it was not ready, with his characteristic impatience he ordered the French penal code to be forthwith translated purely and simply, and enforced in Italy, to the great regret of the Italians, who complained of the arbitrary character of many of the French criminal laws. The proposed Italian code was conceived in a very different spirit: it was printed, together with the discussions which it had elicited, in six volumes, 8vo: '*Collezione dei Travagli sul Codice Penale del Regno d'Italia*,' Brescia, 1807. These particulars are useful for enabling us to understand the history of those times and the true character of Napoleon's legislation and administration.

In 1807 Romagnosi was appointed professor of civil law in the University of Pavia, and in 1809 he was recalled to Milan to lecture on legislative science, in order to form a kind of academy of advocates and magistrates. As part of his scheme, he published his '*Discorso sul Soggetto ed Importanza dello Studio dell' alta Legislazione*,' Milan, 1812; and also '*Principii fondamentali di Diritto Amministrativo*,' 1814. From his lectures he compiled, in 1820, his '*Assunto primo della Scienza del Diritto Naturale*,' which may be considered as a continuation of his '*Introduzione al Diritto Pubblico*

Universale' mentioned above. He demonstrates that society is the natural state of man, from which all his rights and duties are derived; that agriculture, arts and commerce, education and instruction, and religion, are necessary to the social state; and that knowledge, will, and power are the three conditions required for its improvement. On being appointed inspector of the schools of law in the kingdom, he laid down the principle, that candidates for professorships ought to be examined more especially on the system of teaching which they propose to follow, even more than on the subject-matter of their lessons; he insisted, in short, on the importance of pedagogical science and aptitude.

His 'Saggio filosofico-politico sull' Istruzione Pubblica Legale,' Milan, 1807, belongs to this period. He had previously written a 'Progetto di Regolamento degli Studj Politici Legali.' He also edited a 'Journal of Civil and Administrative Jurisprudence.'

When Napoleon's power was overthrown in 1814, Romagnosi lost his offices, but he continued to lecture on jurisprudence till September 1817, when the special chairs at Milan were suppressed. He continued however to teach privately at Milan. In June 1821, during the political agitation of that period, he was summoned to Venice to be tried on a charge of high treason, of which however he was fully acquitted in December of the same year, and the emperor confirmed the sentence of the court in words most honourable to Romagnosi.

He still continued to live at Milan, teaching, and writing for several journals, and especially for the 'Annali di Statistica,' to which he was one of the chief contributors. He wrote also on matters of law, especially on the important subject of property in water, and waterways and channels for irrigation, questions of the utmost importance to Lombardy: 'Della Condotta delle Acque secondo le vecchie, intermedie, e vigenti Legislazioni nei diversi Paesi d'Italia,' Milan, 1822-25, six volumes, with an appendix in two volumes. This work was very well received, not only in Italy, but also in Holland. A second work by Romagnosi on the same subject is entitled 'Della Ragione Civile delle Acque della Rurale Economia,' two vols., Milan, 1829-30. He also began a 'Dizionario Ragionato delle più importanti Parole della Giurisprudenza Romana, Francese, ed Austriaca,' but the work was not continued. His work entitled 'Dell' Indole e dei Fattori dell' Incivilimento con Esempio del suo Risorgimento in Italia,' contains a brief sketch of the progress of human civilisation through different ages, a subject which Herder has more fully and elaborately treated in his 'Philosophy of the History of Mankind.' ('Ideen zur Philosophie der Geschichte der Menschheit.') Long before Romagnosi, the Neapolitan jurist Gianbattista Vico, in his 'Principii di una Nuova Scienza,' and Jacopo Stellini, a native of Friuli, in his remarkable work, 'De Ortu et Progressu Morum,' had laboured in the same field, but their works have scarcely been noticed. Romagnosi had the merit of rendering their inquiries and his own on the vast subject of the progress of civilisation, familiar to the Italian readers.

The other works of Romagnosi are: 1, 'Che Cos' è la Mente Sana?' Milan, 1827; 2, 'Della Suprema Economia dell' Umano Sapere in relazione alla Mente Sana,' Milan, 1828; 3, 'Dell' Insegnamento primitivo delle Matematiche;' 4, 'L'Antica Morale Filosofia;' 5, 'Elogio storico di Melchiorre Gioia;' 6, 'Elogio del Cardinale Albornoz;' 7, 'Note, Supplementi, ed illustrazioni all' India Antica di Robertson.' He left several works in manuscript, among others: 1, 'Della vita degli stati;' 2, 'Della Civile Filosofia in relazione alla Vita degli Stati;' 3, 'Ricerche sulla Validità dei Giudizii del Pubblico a discernere il Vero dal Falso.'

Romagnosi was no dreamer. In an age of confusion of ideas, he retained his mental self-possession, and was not led away by crude theories, nor was he entranced by any superstitious veneration for irrational though ancient custom. He was an original thinker, and as such not justly appreciated in his life-time; but he is now remembered as an able supporter and expounder of sound political principles. Some of the most distinguished later writers of that country, Rossi, Cantù, and others, boast of having been his disciples. Romagnosi was a member of the Italian Academy, of the Academy of the Georgofili, of the French Institute for the class of moral sciences, and of other learned societies. He died at Milan, in June 1835. His funeral was attended by more than two hundred of the most distinguished men of that capital, who felt the value of departed merit, and who subscribed on the spot to raise a monument to his memory.

(Notizia di G. D. Romagnosi, stesa da Cesare Cantù, Milan, 1835.)

ROMAINE, REV. WILLIAM, was born at Hartlepool, in Durham, on the 25th of September 1714. His father was one of the French Protestants who fled to England upon the revocation of the Edict of Nantes, and a man of the strictest piety and integrity. Mr. Romaine was his second son. He was educated at the grammar-school of Houghton-le-Spring, in the county of Durham, whence he proceeded to Oxford in 1730 or 1731, and entered first at Hertford College, and afterwards at Christchurch. He resided principally at Oxford, devoting himself especially to the study of the Hebrew and Greek Scriptures, till he took his degree of M.A. in 1737. He had received deacon's orders the year before. His first curacy was that of Loe Trenchard, in Devon, which he served for six months. In 1738 we find him residing at Epson, in Surrey, and about the same time that he received priest's orders from Dr. Hoadly, bishop of Winchester, he became curate of the parishes of Banstead and Horton, in Middlesex.

At Banstead he became acquainted with Sir Daniel Lambert, who, on his election to the mayoralty of London in 1741, appointed Mr. Romaine as his chaplain. In this capacity he preached a sermon at St. Paul's, on Romans ii. 14, 15. This was the second sermon he published, the first having been one which he preached before the University of Oxford in 1739, entitled 'The Divine Legation of Moses demonstrated, from his having made express mention of, and insisted so much on, the Doctrine of a Future State; whereby Mr. Warburton's Attempt to prove the Divine Legation of Moses from the Omission of a Future State is proved to be absurd and destructive of all Revelation.' At the end of the year 1741 he returned to the attack on Warburton's theory, in a sermon preached at St. Mary's, Oxford, having in the meantime been engaged in an epistolary controversy with Warburton.

The next seven years of his life were devoted to the preparation of a new edition of Calasio's Hebrew Concordance and Lexicon, which was published in 1747. He was chosen lecturer of St. George's, Botolph Lane, and St. Botolph's, Billingsgate, in the year 1748. In the following year he was elected to two lectureships at St. Dunstan's in the West, the duties of which he had discharged for some time, when the rector thought fit to deny him the use of the pulpit. The matter was referred to the Court of King's Bench, which deprived Romaine of one of the lectureships, but confirmed him in the other, with a salary of eighteen pounds a year; but he was still refused the use of lights in the church, and used to preach by the light of a single candle held in his own hand, till this unseemly contest was put an end to by the mediation of Dr. Terrick, the then bishop of London. This lectureship was held by Romaine till his death. In 1750 he was appointed assistant morning preacher at St. George's, Hanover Square. He held this office till September 1755, when he was removed from it, his biographer tells us, on account of "the popularity and plainness of his ministry." About the time of his appointment to this lectureship, he was chosen professor of astronomy in Gresham College. His views of natural science were Hutchinsonian, and he always expressed his opinions with boldness, and not always without bigotry. Accordingly he spoke of the Newtonian views as having "a difference in their demonstrations of no less than one hundred and twenty-one millions of miles," and of "the modern divinity as bringing you no nearer than one hundred and twenty-one millions of miles short of heaven." It is not surprising that he gained little reputation from this office. He seems however to have regained his credit with the citizens by his opposition to the bill for naturalising the Jews in 1753.

In February 1755 he married Miss Price; and in the following year he became curate and morning preacher at St. Olave's, Southwark, where he remained till 1759. During this period he resided in a pleasant retreat in Walnut-tree Walk, Lambeth, where he was in the habit of inviting young clergymen to his early breakfasts, and many have spoken with great gratitude of the instruction and encouragement they received from him. Romaine had frequently preached before the University of Oxford up to the year 1757, when he was refused the use of the university pulpit, in consequence of the offence which was taken at a sermon he delivered there on 'The Lord our Righteousness.' This sermon he published in vindication of his conduct. In the same year he published a tract, addressed to members of the Established Church, exhorting them to set apart one hour in every week for prayer on behalf of the Church and nation. About this time he received pressing invitations to the ministry of a church in Philadelphia, which Mr. Whitefield, whose general religious views he had warmly adopted, strongly urged him to accept, but he preferred remaining in his own country.

In 1764 he was chosen to the rectory of St. Andrew by the Wardrobe, and St. Ann's, Blackfriars. His election was disputed, but in 1766 it was confirmed by the Court of Chancery. He spent the rest of his life in the faithful and zealous discharge of the duties of this office. He died on the 26th of July 1795, and was buried in the rectory vault of Blackfriars Church on the 3rd of August.

Romaine has been compared to a "diamond, rough often, but very pointed; and the more he was broken by years, the more he appeared to shine." His firm attachment to what he esteemed truth was not always tempered with moderation towards his opponents, and sometimes, if we are to believe anecdotes that are told of him, his bold impetuosity betrayed him into acts of rudeness, for which however he always apologised with Christian humility. His deportment in private life was mild and amiable, and he was most exemplary in his domestic relations. He was especially remarkable for the diligence and regularity with which he improved his time. His religious sentiments were strongly Calvinistic, and he spent his life in boldly maintaining them in an age when such a course was sure to excite violent opposition and to shut out all hopes of preferment. During his whole life he continued strongly attached to the Church of England. His chief works, in addition to those already mentioned, are the following:—'Nine Sermons on the 107th Psalm,' 1747; 'A Seasonable Antidote against Popery, in a Dialogue upon Justification,' 1757; 'Twelve Sermons upon Solomon's Song,' 1759; 'Twelve Discourses upon the Law and the Gospel,' 1760; 'The Life of Faith,' 1763; 'The Scriptural Doctrine of the Sacrament of the Lord's Supper briefly stated,' 1765; 'The Walk of Faith,' 2 vols., 1771; 'An Essay on Psalmody,' 1775; 'The Triumph of Faith,' 1795; and some Sermons and Letters. His works were published in 8 vols., in 1796,

with a 'Life' by the Hon. and Rev. William Bromley Cadogan, M.A. Some account of whom is contained in 'The Life and Times of the Countess of Huntingdon,' vol. ii., chap. 49.

ROMANELLI, GIOVANNI FRANCESCO, was born at Viterbo in 1617. He studied a short time with Domenichino, but he is chiefly known as the scholar of Pietro da Cortona; and he was one of the principal hangers-on of Bernini, who appears to have selected Romanelli as a rival to Carlo Maratta and the school of Sacchi, and even to Pietro Cortona himself. Romanelli's picture of 'The Deposition,' in the church of Sant' Ambrogio della Massima, gave him a temporary reputation above all his rivals, which induced Pietro da Cortona to paint a picture for the same church—his 'San Stefano'—which, when it was hung up in its place, so far eclipsed the picture of Romanelli, that Bernini himself observed that it was easy to see who was the master and who the scholar. Romanelli showed more delicacy of execution but considerably less power than Cortona. There is a 'Presentation in the Temple' in one of the chapels of St. Peter's, worked in mosaic, from a picture by Romanelli which is in the church of the Certosa. He was twice in Paris with his patron Cardinal Barberini, and he died at Viterbo in 1662, when about to set out with his family upon a third visit to that capital. There is a large copy of Guido's 'Triumph of Bacchus' at Hampton Court, by Romanelli.

ROMA'NO, GIU'LIO. [GIULIO ROMANO.]

ROMANUS I., an Armenian by birth, served with distinction under Leo the Philosopher and his son Constantine Porphyrogennetus, who made him great admiral. Romanus gave his daughter Helena in marriage to the emperor, who made him his colleague in the empire in 919. Romanus became in fact the real emperor, the weak character of Constantine not being equal to the cares of the state. His own sons however, whom he had named Cæsars, conspired against him, and having seized him, they confined him to a convent in 945, where he died in 948. His two sons did not reap the fruit of their unnatural treachery; they were seized by order of Constantine, and banished to a convent.

ROMANUS II., son of Constantine Porphyrogennetus, and grandson, by his mother's side, of Romanus I., poisoned his father and succeeded him in 959. He showed himself as incapable as he was unworthy of the throne. After a reign of little more than four years, he died in 963, it is said by some of poison administered by his wife Theophana. His widow became regent and guardian of her infant children, and she soon after married Nicephorus Phocas. [NICEPHORUS II.]

ROMANUS III., of a patrician family and senator of Constantinople, was chosen his successor by Constantine IX., and the emperor gave him in marriage his daughter Zoe. He succeeded Constantine in 1028. The beginning of his reign was favourable, but he afterwards met with reverses, his armies having been defeated by the Saracens, and he became stern, avaricious, and unpopular. His wife Zoe, much younger than himself, having formed a guilty connection with an obscure individual called Michael of Paphlagonia, caused her husband to be murdered in the year 1034, upon which she married Michael, and placed him on the throne.

ROMANUS IV., DIOGENES, of a noble family, was a soldier under the reign of Constantine Ducas, and after that emperor's death was chosen by his widow Eudocia for her husband and her partner on the throne, 1068. [EUDOCIA.] He passed with an army into Asia, and carried on a successful war against the Turks, whom he drove beyond the Euphrates. Having afterwards entered Armenia, he was defeated by Alp Arslan, sultan of the Turks, and taken prisoner. He was kindly treated by his conqueror, and obtained his liberty by paying a heavy ransom. In the meantime a revolution had taken place at Constantinople, where Michael, son of Constantine Ducas, had risen against his mother, and shut her up in a convent. Romanus on his way homewards was seized by order of Michael, was deprived of his sight, and banished to the island of Prinkipos, in the Sea of Marmara, where he soon after died in 1071.

ROMANZOV, or RUMIANCOV, NICHOLAUS, COUNT, was the son of the Russian field-marshal Romanzov who became celebrated by his victories over the Turks under the reign of Catherine II. He was born in 1753, and appointed Russian minister at Frankfurt-on-the-Main in 1785. Under the Emperor Alexander he was nominated minister of commerce. He introduced many liberal measures into his department, and it was owing to his exertions that the first Russian expedition round the world, under Krusenstern and Lisianski, was sent out in 1803. In 1807 he was appointed minister for foreign affairs, and soon afterwards chancellor of the empire. He accompanied the Emperor Alexander to the interview with Napoleon at Erfurt in 1808, concluded the treaty of peace with Sweden in 1809, and that of peace and alliance with Spain in 1812, by which Russia formally acknowledged the constitution of the Cortes of Cadiz. In 1814 he left public life, and devoted his time and fortune to the promotion of literature, science, and education in his own country. Many important works were published at his expense, as for instance the 'Diplomatic Code of Russia at Moscow;' the 'History of the Byzantine writer Leo Diaconus,' edited by Professor Hase at Paris, and a Russian translation at St. Petersburg; the 'History of the Mongols and Tatars by Abulghazi,' which was printed for the first time in the original Tatar at Kazan, 1825; and many other important publications relating not

only to the political history of Russia, but also to that of its manners, customs, literature, and art. The scientific expedition round the world by Captain Kotzebue in the years 1815-18 was undertaken and the account of it was published at the expense of Romanzov. He established on his estate of Homel in the government of Mohiloff, under the direction of an Englishman, Mr. Heard, the first Lancasterian and industrial schools in Russia. This patriotic individual died in 1826. He had never been married.

ROMBERG, ANDREAS and BERNHARD, eminent German composers, were the eldest sons of brothers who enjoyed a considerable share of reputation as instrumental performers during the middle and latter part of the last century.

ANDREAS was born at Osnabruck in 1767; BERNHARD in 1770. Both held appointments in the royal chapel of the Elector of Cologne, at Bonn, about the year 1790. Andreas was distinguished by his superior performance on the violin; Bernhard as an almost unrivalled player on the violoncello; and both by their compositions, even at that early period of their career. The progress of the French armies at the commencement of the revolutionary war drove the two cousins to Hamburg, where their talents immediately procured them engagements. In 1795 they quitted that city, and visited many parts of Germany and Italy, establishing their reputation, wherever they presented themselves, as professors of the first class. They returned to Hamburg in 1797, where the elder remained; but the younger left that city two years after, and proceeded alone through England and Spain to Lisbon, and subsequently obtained a good situation in the royal chapel at Berlin. Andreas in the meantime turned his attention more exclusively to composition, and produced four operettas; he also set Schiller's Ode to music. For the church he wrote a 'Dixit Dominus' and a 'Te Deum,' each for four voices, and a 'Pater Noster' for three, besides many psalms. For the chamber or concert-room he composed much music, among other things Schiller's 'Song of the Bell' ('Das Lied von der Glocke'), which is well known to connoisseurs in every part of Europe. He also produced two full operas, 'Die Grossmuth der Scipio' ('The Magnanimity of Scipio'), and 'Die Ruinen von Paluzzi' ('The Ruins of Paluzzi'), the drama of the latter from Mrs. Radcliffe's 'Italian.'

Bernhard, while in Berlin, wrote two operettas and much instrumental music, particularly for the violoncello. Both cousins indeed were for a time chiefly known as authors by their compositions for their respective instruments. Their posthumous fame is mainly attributable to their symphonies and overtures, the best of which have become familiar to the amateurs of this country by the admirable performance of them at the concerts of the Philharmonic Society.

Andreas Romberg died in 1821, and leaving a family in embarrassed circumstances, a concert for their benefit was generously got up in London by the Philharmonic Society, which afforded them temporary relief. Bernhard was appointed a professor at the Conservatoire de Musique at Paris in 1801, and created Chevalier of the Legion of Honour, but retired from the former office two years later. He came to London a second time in 1814, when the Allied Sovereigns visited this country, and gave a concert, by which he was no gainer either in purse or reputation; for imprudently, not to say presumptuously, fixing his tickets of admission at a guinea, his auditors were few, and his own performance too plainly announced either the decay of his powers, or that he had not kept pace with others in the improvements of his art. He died in 1841.

ROMBOUTS, THEODORE, was born at Antwerp in 1597, and studied painting under Abraham Jansens until he was twenty years of age, when he went to Rome, and was soon known as one of the most promising young artists of his time. He obtained from a nobleman in that city a commission to execute a series of twelve pictures of subjects from the Old Testament, which, when completed, added greatly to his reputation. After residing at Rome a few years, and gaining constant employment, he was invited to Florence by the Grand-Duke of Tuscany, and executed for that prince several large historical works for the palace. After an absence of eight years, Rombouts returned to Flanders, and established himself in his native city in 1625. He was soon engaged to paint in the churches, and his pictures excited universal admiration. He was thus induced to believe that he could rival Rubens, who was then in the full exercise of his astonishing powers. Rombouts made the trial, and though he did not succeed, his failure was unattended by disgrace. If his works do not possess the magnificence of his great competitor in their conception, nor his splendour and breadth of effect in their execution, they must be admitted to show a readiness of invention, a correctness of design, an animation of expression, a warmth and brilliancy of colouring, and a surprising facility of touch, which would have placed him, at another time and under other circumstances, at the head of his profession. The works which he executed in competition with Rubens were, 'St. Francis receiving the Stigmata;' the 'Sacrifice of Abraham in the Church of the Recolets;' and 'Themis with the Attributes of Justice,' in the town-house of Ghent. The 'Taking Down from the Cross,' in the cathedral of the same city, is a composition which proves that Rombouts possessed most of the qualities of a great master. In order to gain money however he did not hesitate to paint familiar subjects, such as concerts, assemblies, and merry-makings, which, though executed with taste and freedom, are far inferior to his other works. He also painted

decorations for theatres. Having amassed a considerable fortune, he commenced building a handsome mansion, but had not proceeded far when he found his means to be inadequate, and he pretended that the Grand-Duke of Tuscany required his attendance at Florence, as an excuse for not proceeding with the edifice. The mortification of this disappointment is supposed to have hastened his death, which took place at Antwerp in 1637, according to Houbraeken, and according to Weyermans in 1640.

RÖMER, OLAUS, a Danish astronomer, was born at Arhusen in Jutland, in 1644, of parents who, though not in affluent circumstances, were able to give their son the benefits of a scientific education by sending him to the University of Copenhagen, where he applied himself diligently to the study of astronomy under Erasmus Bartholinus.

He was brought into notice by Picard, who, in 1671, was sent from France by Louis XIV. to make celestial observations in the north, and to verify the position of Uraniburg, once the residence of Tycho Brahé. The French astronomer conceived so great an esteem for the talents of the young Dane, that he engaged him to visit Paris, and when there procured for him the honour of being presented to the king. In consequence of this introduction, Römer was appointed to instruct the Dauphin in mathematics, a pension was settled on him, and the next year the Royal Academy of Sciences made him a member of their body.

While in France, Römer was employed, together with Messrs. Cassini and Picard, in performing geodetical operations for the survey of the kingdom; he also assisted at the Royal Observatory at Paris, and from the observations which he had occasion to make on the immersions and emersions of Jupiter's first satellite, he was led to the discovery of certain inequalities in the times of the occurrence of these phenomena, which had not before been noticed. It was then first remarked, that between the times of the opposition of Jupiter to the sun and the next following conjunction, the emersions of the satellite from the shadow of the planet took place always later than the times indicated by calculation, and that the difference between the observed and the calculated times when the planet was near the points of opposition and conjunction was about fourteen minutes. A contrary circumstance was observed from the time of a conjunction of Jupiter with the sun to the next following opposition; for the immersions appeared to take place more early than the calculated times, the difference of the times, when near the points of conjunction and opposition, being also about fourteen minutes.

There appears however to be some uncertainty whether Römer or Cassini (J. D.) is the astronomer to whom the honour of being the first to perceive the inequality belongs; and Montucla asserts not only that the latter made the discovery, but that he gave an explanation of its cause. He states that Cassini published in 1675 a paper in which it is shown that the phenomena result from the difference between the times during which the particles of light are passing from the satellite to the earth (the planet being, when in opposition, nearer to the earth than when in conjunction, by the whole diameter of the earth's orbit), and in which it is inferred that the velocity of light must consequently be such as to allow it to pass from the sun to the earth in about eight or ten minutes. On the other hand, it is well known that Cassini at first objected to the transmission of light through a part of space in a certain time as a cause of the observed inequality, on the ground that similar inequalities were not observed in the immersions or emersions of the other satellites. Now it is more probable that the French astronomer should have made objections to the hypothesis of another man, than that he should have abandoned one which himself had formed; and even if such abandonment had taken place, Römer ought in justice to be considered as the real discoverer of this important element in astronomical science, since it is admitted that he took up the subject and gave a precise explanation of the circumstances. The reason why the like retardation or acceleration of the times was not, then, observed in the second and the remaining satellites is, that the theory of the motions of those bodies was in that age so imperfect, that the times of the phenomena could not be determined by computation within the number of minutes to which the optical inequality amounts. It is now well known that the latter takes place similarly in the phenomena of all the satellites.

Römer was as good a mechanician as an astronomer. It is to him we owe the application of the epicycloidal curve in the formation of the teeth of wheels, by which the movement is rendered uniform; and an account of the invention was sent to the Academy of Sciences in 1675. De la Hire afterwards claimed the honour of having first discovered the advantage of teeth so formed; but Leibnitz, in a letter to John Bernoulli, states that Römer had communicated the invention to him twenty years before the date of De la Hire's publication. Römer is said to have designed several machines for representing the motions of the planets, and particularly one which exhibited the revolutions of Jupiter's satellites: by this machine it is said that the immersions and the emersions might be determined with great precision.

Having remained ten years in France, Römer returned to Copenhagen, where the king, Christian V., made him professor of astronomy. He was at the same time employed in reforming the coin, in regulating the weights and measures, and in making or repairing the public roads. Having acquitted himself in the performance of these scientific

commissions to the satisfaction of his sovereign, he was named chancellor of the Danish exchequer, and assessor of the supreme tribunal of justice. At length, under Frederic IV., he became burgomaster of Copenhagen, in which city he died, September 19, 1702, having suffered at intervals from the stone during the three last years of his life.

Peter Horrebow, one of his pupils and his successor in the chair of astronomy, published (1735), under the title of '*Basis Astronomiæ*,' the series of celestial observations made by Römer, with a description of the observatory at Copenhagen, and an account of the manner in which the instruments were used.

In determining the apparent places of celestial bodies, it had, previously to the time of Römer, been the practice to observe their altitudes and azimuths, and also their distances from one another or from some body whose place was already found. The trouble of computing the right ascensions and declinations from these elements was considerable, and the Danish astronomer made an important change in the practice of observing, by which this trouble was avoided. He used what is called a transit telescope, with a clock, and also a mural quadrant; with these he observed directly the differences between the right-ascensions (in time) and between the declinations of the sun and the planets or the fixed stars. It is right to remark however that Picard had somewhat earlier fixed in the plane of the meridian a telescope, by which he could, it is said, obtain altitudes between 56° and 61°. Now a space equal in extent to five degrees cannot be seen at once in a telescope, and therefore it is probable that this was moveable in altitude to that extent; and if Römer was at any time a witness to the performance of the instrument, he may have taken from it the idea of making a telescope turn on a horizontal axis through 360 degrees in the plane of the meridian. It appears also that De la Hire contended with Römer for the honour of having been the first to fix a quadrantal instrument in that plane.

ROMILLY, SIR SAMUEL, was born in London, on the 1st of March 1757. His grandfather, a French Protestant, quitted France in consequence of the persecutions which succeeded the revocation of the Edict of Nantes, and established himself in the business of a wax-bleacher, in the neighbourhood of London. His youngest son, Peter, the father of Sir Samuel Romilly, was brought up to the trade of a jeweller, in which he became successful and eminent. Of the numerous family of Peter Romilly, two sons and a daughter alone survived their infancy, of whom Samuel was the youngest. The early education of Samuel Romilly was extremely defective. He was sent with his brother to a day-school, frequented by the children of the French refugees in London, the master of which was ignorant and tyrannical, and incompetent to instruct his pupils in anything beyond reading, writing, and the rudiments of the French language. The elder brother being intended for his father's trade, it was attempted to lead Samuel's inclination to the business of a solicitor; but a disgust implanted in his mind by a view of the discouraging apparatus of an attorney's office in the city, caused the abandonment of this scheme. It was then proposed to place him in the commercial house of the Fludyers, who were near relations of his family, and one of whom, Sir Samuel Fludyer, was his godfather. With a view to this employment he received instruction in book-keeping and mercantile accounts, but the death of both the partners in the house of Fludyer put an end to this promising project, and his father, having failed in several other schemes respecting him, eventually employed him in his own trade, at first simply for the purpose of furnishing him with occupation, and afterwards with the intention that the two brothers should succeed to the business in partnership upon their father's retirement.

During the intervals of leisure which were abundantly afforded him for several years after he left school, at the age of fourteen, Samuel Romilly applied himself assiduously to literary studies, which were more suitable to his serious and somewhat melancholy disposition than the usual exercises and amusements of youth. Ancient history, English poetry, and works of criticism were at this period his favourite objects of pursuit. When he was between fifteen and sixteen years of age he determined to become acquainted with the Latin language, and by means of hard study, and with the assistance of a master, he acquired so much proficiency as enabled him, in the course of three or four years, to read through almost all the classical writers of Rome. He also applied himself to Greek, but, discouraged by the difficulties of self-instruction, he abandoned the attempt, and contented himself with studying the Greek authors by means of Latin versions. In addition to classical studies, he read travels, and acquired a competent knowledge of geography, and some acquaintance with natural history; and he also attended private lectures on natural philosophy, and the lectures on painting, architecture, and anatomy delivered at the Royal Academy.

It is not surprising that a devotion to such pursuits as these should excite aspirations for an occupation more congenial to them than the trade of a jeweller; and his indulgent father, whose pecuniary means had been about this time increased by considerable legacies to his family, and among them a bequest of 2000*l.* to Samuel Romilly, readily yielded to his son's wishes in this respect, and articulated him for five years to one of the sworn clerks in chancery. The object of serving a clerkship of this kind was the purchase of a seat in the Six Clerks'

Office at the expiration of his articles, and the intended retirement of his master was likely to offer a favourable opportunity for the attainment of this object; but Romilly's dislike to the business, and his disinclination to embarrass his father by withdrawing from his hands the amount of the bequest above mentioned, which would have been necessary in order to purchase the seat, determined him to renounce his prospects in the Six Clerks' Office entirely, and to qualify himself for the bar. Accordingly, in May 1778, having served his clerkship, and completed his twenty-first year, he entered himself at Gray's-inn, placed himself in the chamber of an equity draughtsman, and commenced with great ardour the study of the law. He still however pursued his literary studies and exercises, employing much of his time in reading and translating the Latin historians and orators, occasionally writing political essays for the newspapers, and sometimes attending the houses of parliament for the purpose of exercising his own powers of abstraction, argument, and expression, by composing imaginary answers to the speeches which he had heard there.

Not long after he commenced his legal reading, he was attacked by serious illness, which compelled him to lay aside all severe studies, and threatened wholly to interrupt his professional prospects. Fortunately a family incident induced him to undertake a journey to Switzerland, where he remained several weeks in the society of his brother-in-law and most intimate friend the Rev. John Roget, and, returning by way of Paris, he became acquainted in that capital with D'Alembert and Diderot, and formed intimate friendships with several of the most eminent political philosophers of that day, whose conversation and correspondence produced a marked effect upon his character and opinions. He arrived in London after an absence of several months, with his health entirely restored.

In Easter term, 1783, Romilly was called to the bar; but his entrance upon the practice of the profession was postponed for several months in consequence of a second journey to Switzerland, which he undertook for the purpose of attending his sister to England, upon the death of Mr. Roget. In Michaelmas term, 1783, however, he began his attendance upon the courts, and opened his practice with a very inconsiderable amount of employment in drawing chancery pleadings. In the following spring he joined the Midland circuit; but being unknown and without connections of any kind, no encouraging prospect of business appeared for several years. Success at sessions however led to employment on the circuit; and though his progress was by no means rapid, we have his own authority for stating that when the extent of his practice in the Court of Chancery compelled him to restrict himself to London, he had attained to a larger amount of leading 'nisi prius' business than was possessed by any other counsel upon the circuit. (*Memoirs of Sir Samuel Romilly*, vol. i., p. 94.)

In the year after that in which he was called to the bar, Romilly, through his connections in Paris, became acquainted with Mirabeau. By his means he was introduced to the late Marquis of Lansdowne, who had become desirous of his acquaintance upon learning that he was the writer of an anonymous tract, entitled 'A Fragment on the Constitutional Power and Duties of Juries'; and who, having from the first conceived a high opinion of Romilly's talents, continued to be for many years his steady friend and patron. So high was Lord Lansdowne's estimate of his character, and his anticipation of his eventual success, that in the first years of their acquaintance he was twice offered a seat in parliament by that nobleman, which he declined from a feeling of independence. Soon after his first introduction to Lord Lansdowne, his attention was directed by that nobleman to Madan's 'Thoughts on Executive Justice,' a tract which about that time excited much notice. The author of this tract relied upon the well-known principle, that as the object of judicial punishment is to deter from crime, the effect of penal laws is in a great measure lost unless execution follows the sentence with certainty. The principle is true in the abstract; but it was absurd to attempt to apply it in practice to laws so severe as at that time existed in England. In answer to Madan's tract, Romilly published some sensible observations in an anonymous pamphlet, his composition of which was probably the first occasion on which he was induced to consider with attention the principles of criminal law.

Romilly's practice, both on the circuit and in the Court of Chancery, within ten years after he was called to the bar, became considerable. The precise period at which he quitted the circuit is not mentioned in any published account of his life; but it must have been subsequent to 1797, in which year he successfully defended at Warwick a delegate of the London Corresponding Society, prosecuted by the government for sedition (*Howell's State Trials*, vol. xxvi., p. 595), and was probably previous to the summer of the year 1800, when he was made king's counsel. After obtaining rank in the profession as king's counsel, his business in the Court of Chancery rapidly increased; and by 1805, he had the most practice of any of the barristers who attended the Court of Chancery. About this time the Bishop of Durham gave him the office of Chancellor of the County Palatine of Durham, which he held for many years. In the autumn of the year 1805 he was offered a seat in parliament by the Prince of Wales (afterwards George IV.), who at that time adhered to the Whig party, and whose attention had been particularly drawn to Romilly from the circumstance of his being retained in a cause in Chancery, in which the prince was much interested. This offer was declined from the same independent

feeling which had induced him to decline two offers of a similar kind previously made by Lord Lansdowne.

Romilly's early association with some of the most distinguished persons interested in the French revolution, and, above all, perhaps his intimacy with Mirabeau, had given him in the outset of life a decided bias towards what are termed popular or liberal opinions in politics. In consistency with his general principles, he became a decided adherent of the Whigs, and, long before he obtained a seat in the House of Commons, was in the habit of confidential communication with the leaders of that party. On the formation of the Grenville administration, at the commencement of the year 1806, he received the appointment of solicitor-general, and the honour of knighthood, and was brought into parliament by the government for the borough of Queenborough. He was appointed one of the managers for the Commons on the trial and impeachment of Lord Melville, and summed up the evidence in support of the charge. In the course of his first session in parliament he introduced a bill for the amendment of the bankrupt laws (46 Geo. III., c. 135), which passed both houses with very little objection or observation, and constituted a material improvement of that which was then an extremely defective branch of the law of England. After the dissolution of parliament, which took place at the close of the year 1806, he was re-elected for the government borough of Queenborough; and in the early part of 1807, and while in office as solicitor-general, he introduced a bill for the purpose of making real property in all cases assets for the payment of simple contract debts. This just and reasonable measure, although approved by Lord Ellenborough, was strongly opposed in the House of Commons by the Master of the Rolls, Sir William Grant, and rejected by a considerable majority. The opposition offered to this measure by the Master of the Rolls was personally resented by Sir Samuel Romilly with a degree of acrimony scarcely justified by the occasion. A measure founded upon a more limited application of the same principle, by confining it to the freehold property of traders, was, during the next session of parliament, proposed by Romilly and carried (stat. 47 Geo. III., c. 74). At subsequent periods he made several attempts to carry his proposition into execution to its full extent, but without success. His reply to the Master of the Rolls in the first debate on this bill, and his speech about the same time in favour of the abolition of the slave-trade, established his reputation as a parliamentary speaker of the highest character.

In March 1807 the Whig ministers were displaced, and with their removal ended the short official employment of Romilly. He retained however his seat in parliament, and continued until the end of his life a zealous and leading member of the opposition party. On the dissolution of parliament, which took place after the change of ministers, he purchased his return for the borough of Horsham from the Duke of Norfolk—a mode of entering the House of Commons which he characterised as "detestable" (*Memoirs*, vol. ii., p. 201), but which he justified in his own case as being at that time the only mode by which he could hope to obtain a seat in parliament consistently with that entire independence of action which alone made it valuable to him. In the session of 1807 he opposed the several harsh measures which were passed for the suppression of disturbances in Ireland, and warmly supported Mr. Whitbread's bill for establishing parochial schools; and besides the measures respecting the freehold estates of traders above alluded to, he introduced an important practical improvement in the administration of justice, by abolishing an unfair and useless privilege of members of the House of Commons as defendants in equity.

In the early part of the session of 1808, Sir Samuel Romilly lost his seat in parliament for Horsham upon a petition; but after the interval of about a month, he was returned for the borough of Wareham, having purchased his election for 3000*l*.

In the autumn vacation of 1807, Romilly had applied himself to the consideration of the criminal law of England, with a view to remove some of its glaring evils and defects. His attention had been called to the subject at an earlier period, when he composed his observations on Madan's treatise; and he now found himself in a situation, with respect to influence and authority, which justified the hope that he might be enabled to carry into practical operation the doctrines which experience and reflection, together with his acquaintance with foreign laws and the writings of foreign jurists, had long before impressed upon his mind. At the time when Sir Samuel Romilly began to apply his mind to the subject, the penal laws of England were far more severe than those of any other European country—nearly three hundred crimes of various degrees and qualities of moral guilt being then indiscriminately punishable with death. The necessary consequence was a great uncertainty in the execution of criminal justice, proportionately impairing its effectiveness; for, as Lord Coke long ago observed, "too severe laws are never duly executed" (3 *Inst.*, 163). To the removal or mitigation of this great evil Sir Samuel Romilly devoted himself with uncommon energy and perseverance during the last ten years of his life. At first his views of practical improvement were limited, and the only measures which he originally contemplated were, first, a provision by which acquitted criminals should be allowed compensation out of some public fund; and, secondly, an enactment raising the amount of the value of property to the stealing of which capital punishment should be annexed.

The first of these measures, though just in principle, was liable to many serious difficulties in its application to practice, and being strongly opposed in the House of Commons, was early abandoned, and never afterwards resumed; and the second was modified at the recommendation of Mr. Scarlett, afterwards Lord Abinger, who suggested to Romilly, as a much more effectual improvement in the law, the total repeal of all statutes which punish with death mere thefts unaccompanied by any act of violence or other circumstances of aggravation. Though Romilly readily adopted this suggestion, he thought that a proposition for the simultaneous repeal of so large a number of statutes stood no chance of success in parliament, and for that reason he resolved to propose, in detail, the repeal of individual laws, by which punishments of disproportionate severity were enacted, and thus gradually to expunge the whole from the statute book. Accordingly immediately after he had taken his seat for Wareham, in 1808, he brought in a bill to repeal the stat. 8 Eliz., c. 4, which made it a capital offence to steal privately from the person of another; and this measure, after some objection and discussion in the House of Commons, was eventually passed (48 Geo. III., c. 129). His next step towards the attainment of his object was taken in the early part of the session of 1810, when he introduced three bills to repeal several statutes which punished with death the crimes of stealing privately in a shop goods of the value of five shillings, and of stealing to the amount of forty shillings in dwelling-houses or in vessels on navigable rivers; and in order that his views on the subject might be generally understood, he published the substance of the speech delivered by him on his first proposal of the bills, together with some further arguments, in the form of a pamphlet, entitled 'Observations on the Criminal Law as it relates to Capital Punishments, and on the Mode in which it is administered.' One of the bills introduced by him on this occasion was thrown out in the House of Commons by a majority of two voices, in a very thin house; a second reached the House of Lords, and was there thrown out by a large majority—the lord chancellor (Eldon) and Lord Ellenborough using reasons against it which at the present day cannot be perused without astonishment; and the third bill was withdrawn by Romilly, after having in vain attempted to make a house in order to have it read a third time. Notwithstanding this failure, his confidence in the justice of his principles, added to his characteristic firmness and perseverance, enabled him, in spite of all the discouragements arising from the apathy of friends, and the ignorance, prejudices, and party-spirit of enemies, to renew his endeavours to pass these measures in each succeeding session during the remainder of his life; but although several severe laws of a local and special nature were repealed, and although a considerable effect was produced on public opinion by the repeated discussions of the subject, it was not until several years after his death that any substantial improvement of the criminal law was effected.

In the anticipation of a dissolution of parliament on occasion of the king's illness, at the latter part of 1811, Sir Samuel Romilly was invited to allow himself to be put in nomination to represent the city of Bristol. Having accepted this invitation, he went down to Bristol upon the dissolution of parliament at the close of the year 1812, with the most encouraging prospect of success; but an opposition was excited in favour of a merchant of Bristol, whose personal influence and local connections gave him a much more efficient interest among the numerous constituency of that city than that which Romilly had acquired by means of his public character. The consequence was that, after a few days' struggle, he abandoned the contest as hopeless. Upon this failure, he was returned by the Duke of Norfolk for his borough of Arundel; and Sir Samuel considered that the objections which he had entertained in early life against accepting a seat in parliament from the proprietor of a borough no longer applied, inasmuch as his public character was now so fully established, that he could never be suspected of intending to speak or vote merely at the dictation of his patron; and because, since the law had declared the former practice of selling seats to be illegal, there was no other means of entering the House of Commons than by the nomination of a patron or a popular election.

In the interval between the dissolution of the former parliament and the meeting of the new one in 1813, he published a small pamphlet, entitled 'Objections to the Project of creating a Vice-Chancellor of England.' This unsatisfactory plan of reforming the evils of the Court of Chancery he in all its stages strenuously though unsuccessfully opposed.

It would exceed the proper limits of the present article to relate in detail the circumstances of the parliamentary career of Sir Samuel Romilly during the last five years of his life. In addition to his proposals for the improvement of the criminal law, he took an active part in all the political questions of the time, generally acting in zealous opposition to the ministers. He supported Mr. Whitbread's resolution against declaring war with France upon the return of Napoleon I. from Elba in 1815; he opposed the bills for suppressing Irish insurrections, and for the suspension of the Habeas Corpus Act in 1817; and moved resolutions condemning Lord Sidmouth's circular to magistrates respecting the prosecution of seditious libels. He also spoke and voted against the Alien Act, and in favour of an extension of the elective franchise, and of Roman Catholic emancipation.

In the summer of 1818 a dissolution of parliament took place, and Romilly, being solicited to appear as a candidate for the representation of Westminster, was returned at the head of the poll, though he declined to take any part in the canvass, and did not appear upon the hustings until the termination of the election. He died however before the meeting of parliament. Lady Romilly, to whom he was devotedly attached, and whose health had been for some months declining, died at Cowes in the Isle of Wight, on the 29th of October 1818; and this event occurring to a mind already dangerously excited by recent exertions and anxiety, produced a delirium, under the influence of which he put an end to his existence on the 2nd of November 1818.

In his profession, Sir Samuel Romilly attained to greater success than had been enjoyed by any advocate since the time of Sir Edward Coke. Nor did his professional reputation at all exceed his merits. He had a familiar knowledge of the principles of English law as administered not only in courts of equity, but in common-law tribunals; an unusual perspicacity of thought and expression, strong power of reasoning, great earnestness in enforcing his arguments, entire devotion to the interests of his client, and singular prudence in the management of a cause. To these qualities were united a deep sonorous voice, and unequalled impressiveness of manner. On the other hand, he is related to have been stern in his deportment to juniors, and unnecessarily severe in forensic altercation. The tradition of the profession also ascribes to him much eagerness both in acquiring and retaining his practice.

As a politician, Romilly was inflexibly consistent in all his general views, and uniformly acted up to his principles. He displayed however more of the mere spirit of party than was in any sense defensible, or indeed than might have been expected from his enlarged mind and otherwise independent character. His public speaking was perhaps more deeply impressive than that of any speaker of modern times. He expressed himself with great readiness and fluency. Without aid from artificial means, and without the use of figurative language or ornament of any kind, his simple, correct, and nervous style, supported by his serious and dignified deportment and fine voice, often produced an effect equally surprising to the speaker and his hearers. Romilly's style in writing displays the same features as his manner of speaking—clear, easy, forcible, and totally unadorned. In very early life he acquired the habits of reading with care and reflection, and of thinking clearly and closely; and hence arose the faculties of accurate reasoning, and of distinct and powerful expression, for which he was singularly remarkable.

\*THE RIGHT HON. SIR JOHN ROMILLY, the second son of Sir Samuel Romilly, after having, like his father, distinguished himself at the bar, was appointed Solicitor-General in April 1848, and in July 1850 Attorney-General. In March 1851 he was raised to the dignity of Master of the Rolls. For several years during which Sir John Romilly sat in parliament, first as member for Bridport, and afterwards for Devonport, he was a zealous law-reformer. Since he has held his present high office he has done much towards rendering the national records more accessible, and he has extended the boon by laying down a well-devised plan for the publication of the more generally important and interesting of the documents.

ROMNEY, GEORGE, was born at Dalton in Lancashire, December 15, 1734, and was the son of John Romney, a wealthy cabinet-maker of that town. As he showed a mechanical turn at a very early age, he was taken away from school in his eleventh year, and placed in his father's workshop. A watchmaker of the name of Williamson, an eccentric man, who was devoted to alchemy, exercised an influence over the mind of young Romney, which seems to have left a lasting impression; he endeavoured to initiate him in the mysteries of his favourite pursuits, and our young painter was not an unwilling disciple. He appears at a very early age to have had a passion for sketching people and taking likenesses, which he exercised by drawing his fellow-workmen in various attitudes upon the deals and boards in his father's workshop; and his taste was fostered by meeting with Leonardo da Vinci's treatise on painting, embellished with various illustrations. His first effort that attracted any notice was a drawing of Mrs. Gardiner, which induced his father, encouraged by the persuasion of several friends, to place him with a portrait-painter of the name of Steele, who painted heads at Kendal, to whom he was bound for four years, at the age of nineteen.

At Kendal, in 1756, Romney contracted an early marriage with Mary Abbot of Kirkland, by which he displeased his parents; and according to Hayley, although his son denies the fact, he himself shortly afterwards repented of his precipitate step. The result however proved that his choice was eminently worthy of his affections. Having cancelled the indenture with his master, Romney, at the age of twenty-three, commenced painting on his own account. His first production was a hand holding a letter for the post-office window at Kendal, which continued there for many years. His first portraits were two half-lengths of Walter Strickland of Sizewh, and his lady, at whose house he saw a portrait of Sir Walter Strickland, by Lely, and two portraits, by Rigaud, the only pictures by other masters that he had any opportunity of studying previous to his arrival in London. His industry was indefatigable, and nature alone being his guide, he gradually formed for himself a simple and natural style, unblemished by those artificial or adventitious qualities which are so easily acquired

from the schools. Through the influence of his friend Mr. Strickland, he obtained considerable employment from the gentlemen of Westmoreland, in some of whose portraits he introduced dogs, painted with great spirit and truth. Besides portraits he painted many fancy pieces, twenty of which he exhibited in the town-hall of Kendal, and disposed of afterwards by lottery, for which he issued eighty tickets at half-a-guinea each. After exercising his talents for about five years in the north, his ambition directed his views towards the capital; and in the spring of 1762, he set out alone for London, leaving his wife and two young children in Kendal, who, according to the painter's son, were to join him when he had established himself in the metropolis; but the sequel casts a shade over the moral character of Romney. He rose rapidly to fame and fortune, and, with Reynolds and Gainsborough, divided the patronage of the great and the wealthy; but his young wife was never called to share the fortunes of her husband; he concealed his marriage from his friends, and only returned to the neglected mother of his children when he was old and feeble, and required a nurse to administer to his wants and bear with his weaknesses.

Romney commenced his metropolitan career by painting heads for four guineas in the city. In 1763 he obtained a second prize of fifty guineas from the Society of Arts for a picture of the 'Death of Wolfe,' but, it is said through the influence of Reynolds, the decision was revised, and reversed in favour of Mortimer, for his picture of 'Edward the Confessor seizing the Treasures of his Mother.' Romney received a present of twenty-five guineas. This circumstance is supposed by some to have been the principal cause of the ill-feeling which ever after subsisted between Romney and Reynolds.

Romney seems to have met with considerable and early encouragement. He soon moved from the city to the west end, and raised his price for a head to five guineas. At this time he paid a short visit to Paris, where he was much struck with the great *Mary de' Medici* series of pictures by Rubens, in the Luxembourg. Upon his return he painted the portrait of Sir Joseph Yates, one of the judges of the court of King's Bench, a picture which procured him a valuable connection amongst lawyers. Shortly afterwards he obtained a fifty-guinea premium from the Society of Arts for a picture of the 'Death of King Edmund.' In 1767, in consequence of his rapidly increasing practice, he removed to Great Newport-street, within a few doors of the former residence of Reynolds. Here he added greatly to his reputation by a portrait of Sir George Warren and his Lady, with a little girl caressing a bullfinch. He now not only ranked with the first painters of fancy subjects, but he bid fair to rival the President in portrait.

Romney's intercourse with men of taste and learning was now such as to make him feel the necessity of an acquaintance with the works of art upon the Continent. He accordingly set out for Italy in 1773, with a letter of introduction to the pope from that great patron of the arts, the Duke of Richmond. In Rome he paid particular attention to the works of Michel Angelo and Raffaele; and during his stay there produced one of his most beautiful pictures, the 'Wood Nymph,' representing a naked female reposing upon the ground, with her back towards the spectator. From Rome he went to Venice, where he painted the portrait of Wortley Montagu in a Turkish dress. He returned to London in the summer of 1775, greatly improved in every respect by his continental tour.

Shortly after his return to London, he took a house in Cavendish Square, and, under the auspices of the Duke of Richmond, recommenced his career as a portrait-painter, charging 15 guineas for a head, 30 for a half-length, and 60 for a whole length; the President's price being at that time 35 guineas for a head. But Romney soon found it necessary to raise his prices, for sitters of all ranks crowded to his studio; and, notwithstanding they were still comparatively low, in a few years he realised an income of nearly four thousand a year by portraits alone. He subsequently raised his prices considerably: in 1787 to 25 guineas; in 1789, to 30; and in 1793, to 35 guineas for a head, which continued to be his charge during the remainder of his life, the other sizes being charged in proportion.

Romney was now the acknowledged rival of the President in portrait. Lord Thurlow is reported to have said, "Reynolds and Romney divide the town; I am of the Romney faction." Notwithstanding Romney's great employment in portraiture, he found abundant leisure to 'lay in' fancy pieces, many of which however were left unfinished. The most remarkable of those of the earlier part of his career were, 'The Tempest,' 'Tragedy and Comedy nursing Shakspeare,' the 'Infant Shakspeare attended by the Passions,' the 'Alopec,' 'Children in a Boat drifted out to Sea,' 'Shepherd Boy asleep, watched by his Dog, at the approach of a Thunder-storm,' 'Nature unveiling herself to Shakspeare,' &c. Romney is said to have been the originator of Boydell's 'Shakspeare Gallery.' The Tempest and the Infant Shakspeare attended by the Passions were painted for that collection. He made sketches also for five other subjects, but they were never executed; the Banquet and the Cavern Scene in 'Macbeth,' Mrs. Ford and Mrs. Page; Bolingbroke and Margery Jourdain conjuring up the Fiend; and the Maid of Orleans. Romney was an enthusiastic admirer of the celebrated Lady Hamilton, then the beautiful Emma Lyon. According to his son, he made no less than twenty-three pictures from her, some of which however were never finished. She was

painted in various characters, as Iphigenia, St. Cecilia, Sensibility, a Bacchante, Alopec, the Spinstress, Cassandra, Calypso, Magdalene, Joan of Arc, and Pythian Priestess.

Romney's ambition appears to have increased with his years, and in his later days he devoted himself more ardently to fancy subjects than ever. Milton and his Daughters, and Newton making Experiments with the Prism, as a companion to it, were the most popular of these later productions. He sent 100*l.* to Flaxman, then studying in Rome, to purchase casts from the antique for him, who sent him "the cream of the finest things in Rome;"—the group of the Laocoon, the Niobe, the Apollo Belvidere, the Apollo Sauroctonos, groups of the Castor and Pollux, and Cupid and Psyche, the relief on the Borghese vase, several busts, and the best fragments of legs and arms that could be found. These splendid monuments of ancient genius tended only still further to excite the emulation and ambition of Romney; he conceived grand designs of painting 'the Seven Ages,' 'the Visions of Adam with the Angel,' 'the Flood, and the opening of the Ark,' and many from Milton, some of Adam and Eve, and others having Satan as their hero.

This constant excitement seems to have been too much for the painter's nerves, and his mind was gradually giving way under it. His observations called forth by the melancholy fate of his friend Cowper seem to have been almost foreboding of the similar fate that awaited himself:—"If there is a situation more deplorable than any other in nature, it is the horrible decline of reason, and the derangement of that power we have been blest with." The health of his faculties was now rapidly declining, but the return of his friend Flaxman from Rome, of whose talents he had a very high opinion, cheered him for a season. He shortly however became possessed with an idea that his house in Cavendish-square was not sufficiently spacious to admit of the execution of the magnificent designs he had in contemplation, and he accordingly had a house and gallery constructed at Hampstead, upon his own plans and under his own direction. He left Cavendish-square in 1797, after a residence there of twenty-one years, and repaired to his new studio at Hampstead, but not to revel in the dreams of his wild genius, for he was soon oppressed with a degree of nervous dejection that deprived him of all energy. After one or two efforts upon the canvass, he complained of a swimming in the head, and a paralytic numbness in his right hand, and then renounced the pencil for ever.

In the summer of 1799 he was seized with a sudden impulse, and started abruptly for the north, where, in Kendal, his amiable wife still resided, surviving the cold neglect and long estrangement of her husband, and in whom he found an attentive and affectionate nurse, "who had never been irritated to an act of unkindness or an expression of reproach" by thirty-seven years of absence and neglect, during which long interval he had paid but two visits to the north. The kind attentions of this exemplary woman awakened feelings of intense gratitude in the heart of Romney, and he once again enjoyed real happiness, to which in the long years of his prosperity he had been a total stranger. He gave orders for the sale of his property at Hampstead, and purchased a house at Kendal, where he had resolved to remain. But this bright period was of short duration, for upon the return of his brother, Colonel Romney, from India, which was little more than a year after his arrival at Kendal, he suddenly fell into a state of utter imbecility, and he lingered on for nearly two years, unconscious of existence, until the 15th of November 1802, when he died, in the sixty-eighth year of his age. He was buried at Dalton, the place of his birth.

Romney attained to considerable eminence both in history and portrait. According to Flaxman—a warm friend and admirer of Romney—he surpassed all British painters in poetic dignity of conception; and in portrait he was the acknowledged rival of Sir Joshua Reynolds. His productions in poetic and historic art, finished and unfinished, are extraordinarily numerous, comprising every variety of subject—from the illustration of the most simple historical fact to the endeavour to embody the wildest fictions of the poets. Some of these designs were presented in 1817 by the painter's son to the University of Cambridge, to be deposited in the Fitzwilliam Museum; and the Cartoons, so much admired by Flaxman, were by the same gentleman presented in 1823 to the Royal Institution of Liverpool. They consist of eight from the story of Cupid and Psyche, two from that of Orpheus and Eurydice, and one from each of the following subjects:—'Prometheus chained,' 'Descent of Odin,' 'Medea,' 'Birth of Shakspeare,' 'Infant Shakspeare,' 'Death of Cordelia,' 'Ghost of Darius,' and 'Atossa's Dream.'

The following examples will serve to show how extensively Romney was patronised in portrait:—the Duke of Richmond, the Duke of Portland, the Duke of Grafton, Lord Chancellor Thurlow, Warren Hastings, Cowper, Earl of Chatham, William Pitt, Gibbon, David Hartley, Sir Hyde Parker, Lord Melville, Lord Ellenborough, the Archbishops of Canterbury, York, and Dublin, Dr. Parr, Dr. Paley, John Wesley, Thomas Paine, Mrs. Fitzherbert, Mrs. Jordan, and Flaxman modelling the bust of Hayley.

Romney was not a member of the Royal Academy, and he never sent any of his works to its exhibitions. He has had several biographers: Cumberland, the dramatist, wrote a short account of him; his friend Hayley, the poet, published an elaborate life, for which Flaxman

wrote the character of his works; another was afterwards written by his son the Rev. John Romney; and there is an interesting memoir of him in Allan Cunningham's 'Lives of the British Painters,' &c.

ROMULUS. The numerous legends about Romulus, the founder of Rome, may be distributed into two principal classes. One of these represents him as closely connected with the royal family of Alba, and may be considered as the native legend which probably originated among the Romans themselves, and was almost universally believed by the Romans. The second, which connects Romulus with Aeneas and the Trojans, is manifestly of Greek origin, and did not become current until a comparatively late period of the history of Rome. According to the latter story, Romulus was sometimes described as the son of Aeneas, and sometimes as his grandson; and while some writers mention Romulus alone, others represent him as having a brother (Remus), or several brothers. (See the various modifications of this legend, or rather Greek fabrication, in Festus, s. v. 'Roma'; Plut., 'Romul.' 2; and Dionys. Hal. i. 73; comp. Niebuhr, i. p. 210, &c.) This story leaves a vacuum in the history of Rome, which amounts to about three centuries and a half, that is, from the return of the heroes from Troy till the middle of the eighth century before Christ, and various means were devised by ancient writers, such as the building of a second, and even of a third Rome, for filling up this gap. But this story, notwithstanding its incongruities, has sometimes been adopted even by Roman writers, such as Sallust, who states that Rome was founded by Trojans, under the guidance of Aeneas. The genuine Roman legend made Romulus and Remus the twin-sons of Silvia, daughter of the Alban king Procas. The royal house of Alba was in later times represented as descended from Aeneas, while others, preserving the legend more in its original purity, made no mention of its Trojan descent. The main features of the Roman legend which are preserved in Livy (i. 3, &c.; Cic., 'De Republ.' ii. 5; comp. Plut., 'Romul.' 3, &c.; Dionys. Hal. i. p. 61, &c.) are these:—

When Procas, king of Alba, died, he left two sons, Numitor and Amulius. The latter wrested the government from his elder brother, who yielded without a struggle, and lived as a private person in quiet retirement. But Amulius, fearing that the descendants of his brother might punish him for his usurpation, had the son of Numitor murdered, and made his daughter Silvia a priestess of Vesta, an office which obliged her to perpetual celibacy. One day however, when Silvia went into the sacred grove to draw water from the well for the service of Vesta, an eclipse of the sun took place, and the maid, frightened by the appearance of a wolf, fled into a cave. Here she was overpowered by Mars, who promised her a glorious offspring. She was delivered of twins, but the god apparently forsook her, for she was condemned and put to death by Amulius, and it was determined that the two children should be drowned in the river Anio. But the river carried the cradle, with the children in it, into the Tiber, which at the time had overflowed its banks. The cradle was driven into shallow water to a wild fig-tree (*Ficus Ruminalis*) at the foot of the Palatine Hill. A she-wolf, which came to the water to drink, heard the cries of the children, and suckled them; whilst a woodpecker, which was, like the wolf, an animal sacred to Mars, brought them other food whenever they wanted it. This marvellous spectacle was observed by Faustulus, the herdsman of the flocks of King Amulius, and he took the children and carried them to his wife Acca Laurentia or Lupa. Thus they grew up in the shepherd's straw huts on the Palatine: that in which Romulus was said to have lived was kept up to the time of the Emperor Nero. The two youths became the stoutest and bravest among their comrades, with whom they shared their booty. The followers of Romulus were called Quinctilii, and those of Remus, Fabii. A quarrel one day broke out between the two brothers and the shepherds of the wealthy Numitor. Remus was taken by a stratagem, and led to Alba before Numitor, who, struck by his appearance and the circumstance of the age of the two brothers, ordered Romulus likewise to be brought before him. Faustulus now disclosed to the young men the secret of their birth, and, with the assistance of the faithful comrades who had accompanied them to Alba, they slew Amulius, and their grandfather Numitor was restored to the government of Alba.

The love of their humble home however drew the youths back to the banks of the Tiber, to found a new city. The district assigned to them for this purpose by Numitor extended in the direction of Alba as far as the sixth milestone, which was the frontier of the original Ager Romanus, and where, down to a very late period, the Ambarvalia were solemnised. A dispute arising between the brothers as to the site and name of the new city, it was agreed that it should be decided by augury. Romulus took his station on the Palatine, and Remus on the Aventine. Remus had the first augury, and saw six vultures, but Romulus saw twelve. Considering that his double number was a signal proof of the favour of the gods, Romulus and his party claimed the victory. In observance of the rites customary among the Etruscans in the building of towns, Romulus yoked a bullock and a heifer to a plough and drew a furrow round the foot of the Palatine Hill to mark the course of the walls and of the pomerium. Over the parts where he intended to build the gates (portæ) he carried (portare) the plough. The new city thus built on the Palatine was called Roma. Remus, who felt indignant at the wrong which he had suffered, in order to show his contempt of the rude and simple fortifications,

leaped over them; and Romulus punished his brother's insolence by putting him to death.

The population of the new city being very small, the gates were thrown open to strangers. Exiles, robbers, runaway slaves, and criminals flocked to the city as an asylum, and found a welcome reception. The only thing they now wanted was women, but none of the neighbouring people were willing to form matrimonial connections with the new settlers. Romulus therefore had recourse to a stratagem: he proclaimed that festive solemnities and games should be held in the city, and he invited his neighbours the Latins and Sabines to attend them with their daughters. In the midst of the solemnities the females were forcibly carried off: the number thus taken was said to have been thirty. The three nearest Latin towns, Antemnae, Cæcina, and Crustumium, now took up arms against Rome; but Romulus defeated them successively, and having slain Acron, king of Cæcina, he dedicated the first spolia opima to Jupiter Feretrius. The Sabines, under their king Titus Tatius, likewise made war upon Rome; and the treachery of Tarpeia, a Roman woman, opened to them the gates of the fortress on the Capitol. The Sabines attempted to storm the city; and Romulus in this emergency vowed a temple to Jupiter Stator, in order to inspire his men with courage, and to prevent them from flying before the enemy. The war was continued with doubtful success, and finally terminated by the Sabine women throwing themselves between the combatants, and thus restoring peace between their fathers and husbands. Romulus rewarded the women of Rome for their services by the grant of various privileges, and the thirty curiæ were called after the names of the thirty Sabine women. The two nations, the Romans on the Palatine, and the Sabines on the Capitoline and the Quirinal, were united as one nation, though each continued to have its own king.

The two kings and the citizens of the two states met in the valley between the Capitoline and Palatine (comitium), whenever it was necessary to transact business which was of importance to both nations. This union however did not last long, for Tatius was killed during a national sacrifice at Lavinium, and Romulus henceforth ruled alone over the two nations.

During the period that Romulus was sole king he is said to have carried on two wars, one against Fidenæ and another against Veii. Fidenæ commenced the war from fear of the growing strength of its neighbour; but Romulus got a victory over them by stratagem, and took possession of their town. The war against Veii rose out of that against Fidenæ, for both were Etruscan towns. Veii was likewise humbled, but it obtained a truce of one hundred years, after surrendering part of its territory to Rome.

Such are the fortunes and achievements which the old Roman legend ascribed to the founder of the city. He is said to have died after a reign of thirty-seven years (B.C. 716). His death is represented in as marvellous a light as his birth. On the nones of Quinctilis, or on the Quirinalia, the king, while reviewing his people near the marsh of Capra, was taken up by his father Mars, and carried to heaven. The people in terror fled from the spot; but Romulus soon afterwards appeared as a glorified hero to Proculus Julius, and bade him inform his people that in future he would watch over them as the god Quirinus.

Such are the main features of the story of the founder of Rome, which was handed down by tradition, and commemorated in national songs to the time of Dionysius. (Dionys. Hal. i. p. 66.) Writers both ancient and modern have attempted to elicit historical truth from this beautiful and in most parts poetical legend, or have struck out some parts of the narrative as altogether fabulous, and retained others which are more in accordance with the events of real history. The mischievous results of such perverse criticism have been clearly shown by Niebuhr (i. p. 235, &c.)

\* RONGE, JOHANNES, the leader of the so-called 'Catholic movement' which agitated Germany in 1845 and subsequent years, and which for the time threatened a schism in the Roman Catholic Church in Germany, was born at Birchofswalde, a village in Silesia, on the 16th of October 1813. His father was a farmer in humble circumstances, and with a large family; and it was with some difficulty that the boy, after receiving some rudiments of education at the village-school, was sent to the gymnasium of Neisse. He attended the gymnasium from 1827 to 1836, and in 1837 he went to the University of Breslau; in 1839 he served for a twelvemonth as a volunteer in a rifle battalion. To satisfy his friends, he devoted himself to theology, with a view to becoming a Roman Catholic priest. After receiving the necessary education at the Roman Catholic seminary of Breslau, he was appointed in 1841 to a clerical charge at Grottkau. Here he was active in his duties, especially in educating the young. While still at the Roman Catholic seminary however he had contracted a distaste for many of the priestly ideas and methods, and hence he had a reputation for 'liberalism' and heretical opinions. It was objected to him also that he "wore his hair long," and in other respects did not conform to the customs of his order. He had projected and was preparing a work on the 'Abuses of the Church,' but before this work could be got ready an opportunity presented itself of his coming forward in the character of a critic of the Roman Catholic ecclesiastical system in Germany. A vacancy having occurred in the bishopric of Breslau, the Jesuits had been active in exerting their influence in the diocese, and

in trying to get a man of their own appointed. A man of liberal opinions named Knauer had however been nominated bishop, and the efforts of the Jesuits took the shape of activity at the Roman court so as to delay his confirmation. The delay lasted a year, and caused some excitement. While it yet continued (1842), Ronge published in a Saxon journal a letter on the subject, entitled 'Rome and the Chapter of Breslau,' in which the conduct of the ultra-Roman party was severely criticised. Being suspected though not identified as the author of this letter, he was deprived of his charge, and ordered into penance in the Catholic seminary (January 1843). He then removed to the village of Laurahütte in Silesia, where he became teacher in a school attended by the children of the miners of that neighbourhood. He was thus occupied when, in the summer of 1844, Arnoldi, bishop of Treves, issued his famous announcement to the effect that on the 18th of August in that year, and for six weeks following, there would be a public exhibition in the cathedral of Treves of the "seamless coat of Christ," which had been preserved in the cathedral from time immemorial, and which had on previous occasions been exhibited to the great satisfaction of the German Catholics. At the same time a historical account of the 'Holy Coat' was published under the bishop's auspices—setting forth how it had been procured in the Holy Land in the 4th century by St. Helena, the mother of the Emperor Constantine; had been presented by her to her native city of Treves; had there been kept till the year 1121, when it was first openly seen; had at length been publicly produced in 1512; and had in 1514 been made the subject of a special bull by Pope Leo X., in virtue of which an indulgence had been granted to all who should go and pay homage to it, and subscribe for its preservation and adornment.

On the day appointed the 'Exposition' did take place; and between that day and the 6th of October following, immense crowds of Germans and also of foreign Catholics flocked to see the relic—to the number, it was calculated, of more than a million in all. There were rumours of miracles performed by the 'Holy Coat.' Meanwhile the exhibition—being regarded as an attempt to "revive Middle-age Catholicism in Germany"—had aroused much comment throughout the country; and pamphlets had been published by Protestants denouncing it as an imposture—including one by two professors at Bonn, entitled 'The Holy Seamless Coat at Treves and the Twenty other Holy Seamless Coats'—intended to prove historically that there were many rivals to the relic of Treves, having equal claims to authenticity with it, if not better. Into this controversy Ronge threw himself. Under the date, October 1, 1844, he published in his own name, and from his address at Laurahütte, in Silesia, a 'Letter from a Catholic Priest to Bishop Arnoldi' denouncing the Exposition of the Holy Coat. The letter was published in the 'Sächsische Vaterlandsblätter.' Ronge was thereupon excommunicated by the Chapter of Breslau (December 9, 1844). Even among Roman Catholics however, there was a strong public opinion in his favour; and, other circumstances conspiring to produce the result, the occasion was taken to proclaim a schism with Rome and the design of founding a Catholic German Church independently of the Papal See. On the 26th of January 1845, the first German Catholic congregation on the new principle was founded in Breslau, with Ronge as pastor; and in the Easter of the same year, there was a council at Leipzig to agree upon a Creed and settle the organisation of the new Church. The movement spread; an enormous number of pamphlets were published *pro* and *con*; Ronge travelled hither and thither, as the chief of the movement; and over Europe he was heard of as a "second Luther." In a short time as many as 200 societies of the new faith and discipline are said to have been instituted—the Protestants, on the whole, welcoming the phenomenon as a new phase of Protestantism. Time passed on; and after the revolutionary outbreak of 1848, the German governments found it their interest to oppose the new religious development. Most of the Societies were put down; and in 1850 Ronge himself was obliged to take refuge in England. Since that time he has resided chiefly in London, occupying himself partly as a teacher, and partly as a preacher to German exiles: in which latter capacity he has been endeavouring to found what he calls a 'Humanistic Society.' He has published, among other things, 'A Practical Guide to the English Kinder-Garten (Children's Garden);' being an Exposition of Froebel's System of Infant Education,' 1855. In Germany the societies founded under his impulse have been, in the main, suppressed; but there are said to be societies, on the same footing, among the Germans in America.

RONSARD, PIERRE DE, was born in 1524, in the district of old France called Vendômois. He was the son of a maître-d'hôtel of Francis I., who made him a knight. Pierre studied for a short time in the college of Navarre at Paris, but soon after he entered the service of the Duc d'Orléans, son of Francis I., in the quality of page. He afterwards attended, in the same capacity, James Stuart, king of Scotland, who had come to Paris to marry Marie de Lorraine, and he accompanied James on his return to Scotland, where he remained three years. On his return to France he resumed his post with the Duc d'Orléans, who sent him on several missions to Scotland, Ireland, and other countries. He was afterwards sent by Francis I. on a mission to Piedmont. In these several journeys he suffered much, in consequence of which he became deaf. On withdrawing from active life he retired to the college of Coqueret, where he studied the classics under

Turnèbe, became a good Greek scholar, and took orders as a priest. He also began writing French poems, and was crowned in the floral games at Toulouse. He was considered as the successor of Marot, and the chief of the French poets of the time. Montaigne, De Thou, Scaliger, Muret, Pasquier, and others commended him highly; but modern critics have judged him more severely. Boileau says that Ronsard's language was a heterogeneous compound of various languages and dialects, and that his muse spoke Greek and Latin in French verses. Malherbe and La Bruyère have spoken of him in the same strain. Charles IX. bestowed on Ronsard an abbacy and other benefices. His moral conduct however is said not to have been strictly clerical. He died in 1555, in one of his livings near Tours, and a solemn funeral service was celebrated in honour of him at Paris, in the chapel of the college of Boncourt. Ronsard had certainly poetical genius, but he was deficient in taste. He was in this respect in France what the seicentisti of the following century were in Italy and Spain. His poetical works are numerous; they consist of odes, hymns, eclogues, &c.: 'Mascarades, Combats, et Cartels faits à Paris et au Carnaval de Fontainebleau.' He also began a poem, 'La Franciade,' which he left unfinished. His works are now nearly forgotten. The most complete edition of them is that by Richelet, 2 vols. folio, Paris, 1623.

ROOKE, ADMIRAL SIR GEORGE, the eldest son of Sir William Rooke, was born at his father's seat, the priory of St. Lawrence near Canterbury, in the year 1650. He entered the navy as a volunteer, and at the age of thirty had attained the rank of post-captain. In 1689 he was sent out as commodore with a squadron to the coast of Ireland, where his services were such as to induce William III. to promote him to the rank of rear-admiral of the red. He soon afterwards bore a part in the indecisive action between the Earl of Torrington's fleet and that of the French admiral Tourville, off Beachy Head. In 1692 Rooke was advanced to the rank of vice-admiral of the blue, and greatly distinguished himself in the battle off Cape La Hogue (properly La Hague) between the French fleet and the combined English and Dutch fleets under Admiral Russell, May 19, 1692; but a part of the French fleet having escaped into La Hogue, and being hauled up so high that the English ships of the line could not reach them, Rooke volunteered on the following day to attack them with the boats of his squadron. This service he performed at night under cover of a fire from his frigates and smaller vessels; and so well was his plan contrived, and so unexpected and suddenly executed, that though six French three-deckers were burnt that night and seven other ships of the line on the following morning, the loss of the English only amounted to ten men. For this exploit Rooke was rewarded with the rank of vice-admiral of the red, a pension of 1000*l.* a year, and the honour of knighthood.

After the peace of Ryswick in 1697, Sir George Rooke was elected member of parliament for Portsmouth; and though he was attached to the Tory party, then in opposition to the government, Queen Anne, on her accession in 1702, appointed him "vice-admiral and lieutenant of the admiralty, and also lieutenant of the fleets and seas of this kingdom," having previously constituted her royal consort prince George of Denmark generalissimo of her forces by land and sea. The war of the succession had now commenced, and an attack upon Cadiz was resolved upon, the land-forces being under the command of the Duke of Ormond, and the combined English and Dutch fleets under Rooke. The attack was begun, but, in consequence of the opposition of the Prince of Hesse, was not persevered in. Having received intelligence however that the Plate fleet, under convoy of a French squadron, had taken shelter in the port of Vigo, the duke and Sir George resolved to proceed there. The duke stormed the town with 3000 men, while the fleet took and destroyed seventeen ships; six galleons being taken by the English and five by the Dutch, who burnt five others. The value of the specie and goods taken was estimated at five millions of dollars. Sir George Rooke having been joined by Sir Cloudesley Shovel, with a large reinforcement from England, they resolved to make an attack upon Gibraltar. On the 21st of July 1704 the Prince of Hesse, with 1800 marines, was landed on the isthmus, while the ships commenced a cannonade upon the fortress, which, having been kept up for about six hours, the Spaniards began to fly from the batteries. The boats were then manned and armed, and the seamen succeeded in making themselves masters of the great platform, which they retained till the following day, when a reinforcement of seamen enabled them to carry another strong battery, which put them in possession of most of the enemy's cannon. The governor then accepted the offered terms of capitulation, and the fortress surrendered.

On the 9th of August 1704 Rooke fell in with the French fleet under the Comte de Toulouse, who had recently put to sea from Toulon, with fifty-two ships of the line and twenty-four galleys. The French admiral endeavoured to get away, though, according to Rooke's statement, he had a superiority of 600 guns, but on the 13th of August Rooke brought him to action off Malaga. The battle began in the forenoon, and ended with the day, when the French went off to leeward, and, the weather being hazy, escaped. This was a hard-fought battle. The French lost upwards of 3000 men, and the English upwards of 2000.

Sir George Rooke on his return to England was received by Queen Anne at Windsor with great distinction, but finding that the government was hostile to him, he resigned his employments, gave up his

seat in parliament, and passed the rest of his life at his seat of St. Lawrence, where he died on the 24th of January 1709, aged fifty-eight, and was buried in the cathedral of Canterbury. He was thrice married.

ROOKER, MICHAEL ANGELO, an artist of considerable merit as a landscape-painter and engraver, was born in London about 1743. His father, Edward Rooker, also a skilful designer and engraver, who excelled in landscapes and architectural views, appears to have been a singular character, having for some time acted as a harlequin at Drury Lane Theatre. Michael Angelo was taught engraving by his father, and executed the head-pieces to the 'Oxford Almanack' for several years, from his own drawings. In landscape-drawing, which is said to have been his favourite occupation, he was instructed by Paul Sandby, whose style he imitated. His manner is not powerful, but his drawings display taste and feeling. For several years Rooker painted the scenes for the Haymarket Theatre. He was one of the early associates of the Royal Academy, and died on the last day of February 1801, at the age of fifty-seven or fifty-eight.

ROOS, PHILIP PETER, a painter commonly called ROSA DA TIVOLI, from his long residence at that place, was born at Frankfurt in 1655. He was instructed in art by his father, who was in the service of the Landgrave of Hesse, by which prince Philip was sent to Italy, and allowed a pension during the period of his study. On arriving at Rome he applied himself assiduously to painting, and acquired an astonishing facility of hand; indeed, such was his rapidity of execution that C. le Blond, who was at the same time at Rome, declares that Roos copied in chalk the arch of Titus within half an hour, and that with a considerable degree of finish. He devoted his talents chiefly to painting animals, which he designed mostly from nature. To facilitate his studies he established himself at Tivoli, where he kept a kind of menagerie for the purpose of drawing from the life with correctness such animals as he required for his pictures. His other subjects generally represent pastoral scenes, with herdsmen and cattle, and works of a similar nature, some of which are executed as large as life. His groups are composed with much judgment; and the landscapes in his backgrounds, his skies and distances, are treated with fidelity, and executed in a masterly style. Yet, although he painted with great facility, his productions betray no appearance of negligence or inattention; they are free, without being deficient in finish. His pictures, according to Lanzi, are to be found in the galleries of Vienna, Dresden, and other capital cities of Germany, besides an immense number in Italy and many in England, though we have no specimen by his hand in the National Gallery. He was a member of most of the principal academies of Europe. He is said by Huber to have etched a few plates of pastoral subjects, which are very scarce.

ROSA, SALVATOR, was born at Renella, or Arenella, a village in the environs of Naples, on the 20th of June 1615, and he was originally intended for the Church. Whilst yet a boy he manifested a strong propensity for drawing, and in order to cure him his parents procured his admission as a student in the college of the congregation of Somasca in Naples; but before the expiration of the usual period of residence, he was either expelled or voluntarily quitted the college. On his return to Renella he devoted his time to the study of music, and cultivated his talent for poetry; and on the marriage of his eldest sister with Francesco Francanzani, a disciple of the Spagnuolo school, he attended the studio of that artist. He also studied from nature in oil-colour, and in 1633 went from Naples on a tour through the wild scenery of La Basilicata, La Puglia, and Calabria. During his absence he appears to have associated with banditti. At this period Salvator seems to have fostered and matured his taste for romantic scenery, and the studies which he made of groups and single figures whilst with the bandits served him as valuable materials for his future works. Soon after his arrival at Renella his father died, leaving the family dependent upon Salvator, who was then certainly not more than eighteen years of age, for their support. To perform this duty, he executed with great rapidity subjects on primed paper, his poverty not enabling him to purchase canvas, and sold them to the dealers who keep the stalls in the Strada della Carità in Naples. One of these, representing the story of Hagar and Ishmael, was seen and purchased by Giovanni Lanfranco, who was then in the city decorating the church of Gesù Nuovo for the Jesuits. The admiration of that painter was valuable to Salvator, for his works rose in price accordingly, but at the same time it laid him open to the malice and envy of other Neapolitan artists. They ridiculed the efforts of a man who had been obliged to seek the patronage of mean dealers, and he retorted upon them in epigrams, and satirical verses which he set to music and sang. He however obtained the friendship of Aniello Falcone, an eminent painter of battles, the first and best of the pupils of Spagnuolo, who gave him instruction, and after a time introduced him to the notice of that great painter, from whose advice and practice he derived great benefit.

On the invitation of his former friend, who was in the establishment of the Cardinal Brancaccio, he repaired to Rome. Here he enjoyed the patronage of the cardinal, who took him to the bishopric of Viterbo, where, besides other works, he painted an altar-piece representing the incredulity of St. Thomas, for the Chiesa della Morte. In 1639 he went again to Rome. The reputation of Salvator was now at its height: he was esteemed as a painter, a poet, a musician, and an

actor; for the plays which he performed were written by him, the music composed by his hand, and the principal character represented by himself. As an artist, he was most extensively patronised, and at very high prices. In 1647, on the breaking out of the revolt of Masaniello at Naples, Salvator Rosa returned to that city, and became a member of the band. On the suppression of the revolt, he made his escape from Naples in the train of the Prince Carlo Giovanni de' Medici, with whom he went to Florence, where he was employed by the grand-duke to paint in the Pitti Palace. Here he associated with the literati and the principal nobility. After remaining several years at Florence he returned to Rome, and was again extensively employed. In 1663 he executed three pictures for the exhibition of San Giovanni; one was Pythagoras on the sea-shore, the second was the same philosopher recounting his visit to the infernal regions, and the third the prophet Jeremiah thrown into a pit for having prophesied the fall of Jerusalem; and soon after he produced his most celebrated picture, the 'Catiline Conspiracy.' In 1668, at the annual exhibition of the Feast of San Giovanni Decollato, he placed his 'Saul and the Witch of Endor' in competition with the works then shown of the elder masters. He did not execute any important works after this, and died of an attack of the dropsy, on the 15th of March 1678. He was buried in the vestibule of the church of Santa Maria degli Angeli, which was erected over the ruins of the baths of Diocletian, by Michel Angelo. Salvator Rosa left one son, by Lucrezia, a mistress, who accompanied him from Florence, and to whom he was married shortly before his death.

Rosa possessed great invention, and had a wonderful facility of execution. He is superior when he confines his efforts to works of the easel size, and his figures are then correct in drawing and spirited in design. Such is the case in his picture of 'Atilius Regulus,' formerly in the Palazzo Colonna at Rome, and now in the possession of the Earl of Darley. Of his landscapes, it may be observed, that he wholly rejected the simplicity and amenity cultivated by Claude and by Poussin, and indulged in gloomy effects and romantic forms; nor are his sea-pieces less forcible; in them he represents the desolate shores of Calabria, and not unfrequently adds interest to his works by the terror of shipwreck. According to Sir Joshua Reynolds, he gives a peculiar cast of nature, which, though void of grace, elegance, and simplicity, though it has nothing of that elevation and dignity which belong to the grand style, has yet that sort of dignity which belongs to savage and uncultivated nature. Elsewhere, Sir Joshua very truly observes, "What is most to be admired in Salvator Rosa is the perfect correspondence which he observed between the subjects which he chose and his manner of treating them. Everything is of a piece: his rocks, views, sky, even to his handling, have the same rude and wild character which animates his figures." But in his efforts to maintain this bold and romantic style, Salvator, it must be admitted, is often extremely careless in his drawing, both trees and rocks being in outline and surface quite untrue to nature.

There are a great number of his pictures in England, several of which are in the collections of the Marquis of Westminster, the Earl of Ellesmere, the Duke of Devonshire, the Earl of Darley, and others. The National Gallery contains one large landscape by him—'Mercury and the Woodman.' His etchings consist of about ninety in number, executed in a spirited and masterly style. The chiaroscuro is admirably managed, and the heads of the figures are full of expression. His monogram is composed of an S and R combined, the former letter drawn over the straight line of the latter.

Some of the music-books of Salvator Rosa were, amongst other musical manuscripts, purchased by Dr. Burney, at Rome, and amongst many airs and cantatas by different masters, there were eight entire cantatas, written, set, and transcribed by the painter himself. From the specimen of his talents for music there given, there seems to be no doubt that he had a truer genius for this science, in point of melody, than any of his predecessors or contemporaries, and there is a strength of expression in his verses which must always place him above the middle rank of poets. To his other accomplishments he added architecture, which, according to Pascoli, he understood perfectly; and he excelled as a comic actor, an improvisatore, and a performer on various musical instruments.

\*ROSAS, DON JUAN MANUEL DE, formerly president of the Argentine Confederation, is a native of South America, but descended from Spanish progenitors. The states bordering on the Rio de la Plata from the time of their casting off their dependence on Spain, had been in a continued state of change. Sometimes they constituted themselves independent and frequently hostile states, sometimes they formed a federal state, and sometimes there were federations of two or three. In January 1831 Rosas, who had previously displayed capacity and courage in subordinate employments, was appointed governor or captain-general of Buenos Ayres, which province was then in federal union with Entre Rios, Corrientes, and Santa Fé. In this position his first enterprise was to subdue the disaffected Indians, which he accomplished by his promptitude and energy, thus securing internal peace, and establishing a character for himself. In 1835 the confederation was dissolving into anarchy, when Rosas was elected president of the whole Argentine Confederation. The other states acceding, Rosas still retained his position in Buenos Ayres, which state was specially charged with the management of those affairs which were

common to the whole. The activity and firmness of Rosas were productive of some immediate good results, civil war was for a time quenched, industry promoted, and commerce extended; but his great object was to extend and uphold the predominance of Buenos Ayres over the whole confederation, and by tyrannical measures to make the trade of La Plata a monopoly to Buenos Ayres. This desire led to an attempt to force Paraguay to join the Confederation, and to an attack on Monte Video. The first produced a war with Brazil, the second a war with England and France. He was of course beaten, but resisted stubbornly from 1845 to 1850. He did not even then submit, but his rule having become intolerable to the subject states, they revolted, chose Don J. J. Urquiza as their president and general, and on February 2, 1851, Rosas and his army were utterly routed at Moron in Buenos Ayres, and Rosas was indebted for his escape with his life to the disguise of a peasant and the assistance of the British consul. He sought refuge in England, and Urquiza's authority, though it was not peacefully maintained, still subsists.

ROSCIUS, QUINTUS, a celebrated Roman actor, was born near Lanuvium (Cic., 'De Div.,' i. 36), but at what period is uncertain. He is frequently mentioned in the writings of Cicero, who was his friend and warm admirer. His talents also obtained for him the friendship of Sulla, who, during his dictatorship, presented him with a gold ring, the mark of equestrian rank (Macrobi., 'Sat.,' ii. 10), which honour was the more remarkable, as many passages in the Roman writers prove that the histrions were generally held in great contempt. So perfect however was Roscius in his art, that his name became almost synonymous with excellence in any other branch; and thus when an orator produced a great impression on his audience, it was customary to say, "a Roscius is on the stage." (Cic., 'De Orat.,' i. 28; 'Brut.,' 84.) Actors frequently received instruction from Roscius, who used to say however that he had never had any pupil with whom he was satisfied. ('De Orat.,' i. 28.) Macrobius relates (l. c.) that Cicero and Roscius used to try which of the two could more frequently express the same thought—the one by his eloquence, the other by his gestures; and that Roscius derived from this exercise such a high opinion of his own art, that he wrote a work, in which he compared eloquence with the art of acting. Macrobius also states that Roscius received about a thousand denarii (upwards of 35*l.*) a day for his acting. He died about B.C. 61; since Cicero, in his oration for Archias, which was delivered in that year, speaks of his death as quite recent (c. 8). There is an extant oration of Cicero, though considerably mutilated, in defence of Roscius. The subject of the oration is a claim of 50,000 sesterces against Roscius by C. Fannius Chaerea ('Ueber die Rede des Cicero für Q. Roscius,' Zeitschrift, i. 248).

ROSCOE, WILLIAM, was born March 8, 1753, at a public house called the Old Bowling Green, on Mount Pleasant, near Liverpool, which was kept by his father, who also followed the business of a market gardener. He received a common school education till he was twelve years of age, when he was removed from school to assist his father in his gardening business; but he continued to improve himself by reading. When in his fifteenth year he was placed with a bookseller, but disliking the shop, he was in the following year apprenticed to an attorney in Liverpool. In 1774 he was admitted an attorney of the Court of King's Bench, and began to practise as such, but during these years he had steadily prosecuted his studies in the Greek and Latin languages, and made himself master of French and Italian. He had also paid a good deal of attention to the fine arts, and written some poems, among others one on the origin of the art of engraving, which made him known to Sir Joshua Reynolds, Fuseli, and other distinguished artists. In 1784 he was elected honorary member of the Manchester Literary and Philosophical Society. He also turned his attention to the subject of the slave-trade, and wrote several pamphlets recommending its suppression. When the French Revolution first began, Roscoe was one of its warmest partisans in this country. He wrote 'Strictures' on Burke's 'Two Letters' addressed to a Member of the present Parliament, reflecting in severe terms upon what Roscoe considered as an apostacy in Burke's political conduct. In 1796 Roscoe published the 'Life of Lorenzo de' Medici, called the Magnificent,' a work which established his literary reputation. The subject was happily chosen, and the author treated it well. The work went through several editions, and was translated into Italian, German, and French. It was generally well received on the Continent, but its spirit was criticised by two classes of writers: one of them, of which Sismondi may be considered as the representative, see nothing but perfection in a republican government, and cannot forgive Lorenzo for having controlled and curbed the Florentine democracy. Sismondi charged Roscoe with having deceived himself and others with regard to the character of his hero, who in Sismondi's eye was an insidious and crafty tyrant. It is curious to see Roscoe, who at one time was the advocate of the French Revolution, accused of being the panegyrist of the tyranny of the Medici. Another class of critics was angry with Roscoe for having exposed the part which Pope Sixtus IV. took in the conspiracy of the Pazzi, which led to the murder of Giuliano, Lorenzo's brother, and also for having spoken unfavourably of Cardinal Barbo, afterwards Paul II. On the subject of the Pazzi, Sismondi joined the papal advocates in representing that conspiracy as a laudable deed, justifiable under the circumstances in which it took place. After many years Roscoe replied to his various critics in

pointed though temperate language in his 'Illustrations, Historical and Critical, of the Life of Lorenzo de' Medici,' 4to, London, 1822. He inserted in the appendix, among other documents, an important letter written to Sixtus IV. by the signoria, or executive, of Florence after the failure of the Pazzi conspiracy, which letter was discovered in the archives of Florence by the Rev. F. H. Egerton, and printed at Paris in 1814.

The second historical work of Roscoe is his 'Life and Pontificate of Leo X.' In this also the author has been charged with undue partiality for his subject. He has reflected with much severity upon the great reformers of the 16th century, because, while they struggled against the overgrown absolutism of papal Rome, they could not divest themselves at once of the habit of intolerance which they had derived from early education. Count Bossi translated the 'Life of Leo' into Italian, adding notes in which he rebutted several of the charges brought against Roscoe's former work concerning Lorenzo: 'Vita e Pontificato di Leone X., di Guglielmo Roscoe, tradotta e corredata di annotazioni ed altri documenti inediti, dal Conte Luigi Bossi, Milanese,' Milan, 1817.

Considered as works of erudition and of general interest, the lives of Lorenzo and Leo by Roscoe stand deservedly high. They introduce the reader to a splendid period of modern history, among a chosen society of scholars, poets, statesmen, and artists, who gathered round the hospitable board of Lorenzo, and afterwards in the more pompous court of his son Leo. Numerous anecdotes and other particulars concerning those individuals make the reader familiar with their persons; and poetical extracts and valuable historical documents add to the value of the work. The style is remarkably pleasing and fluent. These merits of Roscoe's biographies have been universally acknowledged, even by those who have censured the general spirit of his works.

Roscoe contributed greatly to encourage among his countrymen a taste for Italian literature and the fine arts. In his own town of Liverpool, the Royal Institution owes its formation to Roscoe's exertions.

Roscoe was returned to parliament for Liverpool in the Whig interest. In the latter part of his life he became partner in a banking-house, in which however he was not successful. He died at Liverpool, in June 1831. A biographical notice of him was appended to a new edition of his Life of Lorenzo, by his son Henry. The Life of Lorenzo, with this biography of the author, has been published as a volume of Bohn's 'Standard Library,' and 'The Life and Pontificate of Leo X.' forms two more volumes of that series.

Three of Mr. Roscoe's sons have secured an honourable name in literature. HENRY, the author of the Memoir of his father, was a barrister, and the author of several legal works. He also wrote the 'Lives of Eminent Lawyers' for Lardner's 'Cyclopædia.' He died March 25, 1836, aged thirty-seven. ROBERT, the third son, also a member of the legal profession, wrote some pleasing poems, and completed 'Alfred,' an epic (remarkable rather for its extent than its grandeur) begun by Mr. Fitchett: he died in December 1850, aged sixty. THOMAS, who is still living, has been however the most prolific writer: the list of his productions includes several poems and tales, a 'Tour in the Isle of Wight,' Tours in North and South Wales, and other illustrated works, and several translations, the most valuable, perhaps, being an excellent one of Sismondi's 'Historical View of the History of the South of Europe.'

ROSCOMMON, WENTWORTH DILLON, EARL OF, was born in Ireland about 1633. He was the son of James Dillon, third earl of Roscommon, and Elizabeth Wentworth, sister to the Earl of Strafford, who was godfather to his nephew, and gave him his own family name. Upon the breaking out of disturbances in Ireland, Strafford sent for him, and placed him at his own seat in Yorkshire, where he had him instructed in Latin, which Dillon is said to have learned so as to write it with purity and elegance, though he was never able to retain the rules of grammar. When the storm had overtaken Strafford, Dillon was sent to Caen, where he prosecuted his studies under Bochart. He afterwards travelled into Italy, where he examined with care the most valuable remains of classical antiquity, and he acquired uncommon skill in the knowledge of medals. He returned to England at the Restoration, and was made captain of the band of pensioners, a preferment which led him into the habit of gaming and the loss of much of his fortune. He was subsequently master of the horse to the Duchess of York, and he married the Lady Frances, daughter to the Earl of Burlington, and widow of Colonel Courtney.

Wood says of Roscommon that he was "educated from his youth in all kinds of polite learning," and that he "was accounted most excellent in the art of poetry." He was nominated at Oxford to be created LL.D., May 23rd, 1683, but did not appear at the time appointed. Whether he had previously been connected with the University is uncertain. He formed the intention of escaping apprehended evils at home by retiring to Rome, but he was delayed by the gout, which, through improper medical treatment, occasioned his death. At the moment in which he expired, he uttered, with an energy of voice that expressed the most fervent devotion, two lines of his own version of 'Dies Iræ':

"My God, my Father, and my Friend,  
Do not forsake me in my end."

He died in 1684, and was buried with great pomp in Westminster Abbey.

Roscommon wrote the following works: 1, 'An Essay on translated Verse,' London, 4to, 1680; 2, 'Prologues and Epilogues to Plays,' &c., collected, 8vo, 1684; 3, 'Horace's Art of Poetry,' translated into English blank verse, 4to, 1680; 4, 'Dr. Wm. Sherlock's case of Resistance of Supreme Powers,' translated into French, 8vo. A short time before his death, Roscommon, among other literary projects formed the plan of a society for refining the English language and fixing its standard, and he is said to have been assisted in the design by John Dryden.

\*ROSE, HEINRICH, was born at Berlin in 1795. Both his grandfather and father had possessed considerable reputation as chemists, and Heinrich followed the hereditary course. He learnt pharmacy in Danzig, studied in the University of Berlin, and in 1819 at Stockholm under Berzelius. After a short residence at Kiel, he graduated at Berlin, where in 1823 he was made professor extraordinary of chemistry in the university, and in 1835 professor in ordinary. He is one of the most distinguished scholars of Berzelius, and as a practical analyst, particularly in the department of inorganic chemistry, holds a high rank. The results of many of his exact and acute investigations are recorded in Poggendorff's 'Annalen,' and have greatly contributed to the extension of real knowledge in that department of science, while he has carefully avoided everything of a disputatious character, and rests his opinions entirely upon experiment. His great work, 'Handbuch der analytischen Chemie,' first published in 1829-31, has gone through several editions. It has been translated into French as well as into English, and enjoys an European fame.

\*ROSE, GUSTAV, his brother, was born, also in Berlin, in 1798. He directed his attention more especially to mineralogy, and in 1816 was sent to Silesia to pursue his studies practically in the mines, but on account of ill-health returned to the theoretical study. In 1820 he graduated at Berlin, and in 1821 placed himself under Berzelius at Stockholm. In the same year he was created keeper of the mineral collection in the university of Berlin, in 1825 professor extraordinary, and in 1839 professor, of mineralogy. Besides numerous essays in the 'Annalen,' he has published 'Elemente der Krystallographie,' 1846; the mineralogical and geognostic portion of the 'Journey to the Ural and Altai Mountains and to the Caspian Sea,' made by him in 1829 with Alex. von Humboldt and Ehrenberg; a treatise, 'Ueber das Krystallisations-system des Quarzes,' 1846; 'Ueber die Krystallformen der rhomboëdrischen Metalle, namentlich des Wismuths,' 1850; and 'Das Krystall-chemische Mineralsystem,' 1852; all of them illustrated with plates.

ROSELLI, COSIMO, a celebrated old Florentine painter, was born at Florence, according to Gaye, in 1439. There are few of his works remaining; the principal is the fresco in the convent of Sant' Ambrogio, at Florence, painted in 1456, according to an inscription upon it by Rumohr, when Cosimo cannot have been more than eighteen years of age, according to the above date: Vasari however says it was painted in his youth. And Rumohr observes that Cosimo, in the commencement of his career, followed the path which was opened by Angelico da Fiesole and Masaccio; but that after a few brilliant examples of his ability, he left the approximation of the representation of things as they really appear, to follow an uninteresting, inanimate, and ugly manner. The fresco represents the transportation of a miracle-working chalice from the church of Sant' Ambrogio to the episcopal palace; the abbess and nuns follow in the procession, and at the palace-gate is a group of priests and choristers ready to receive it: around is a crowd of curious spectators. The story is told, and the picture described, in Richa's 'Chiese di Firenze.' The picture has been engraved by Lasinio for his series of old Florentine paintings, and a group from it in Lastris's 'Etruria Pittrice.'

Cosimo was one of the painters invited by Pope Sixtus IV. to Rome to paint the Cappella Sistina, built in 1473, by Baccio Pintelli, for that pope. Cosimo's paintings in this chapel are still in good preservation; they are—the Destruction of Pharaoh's Host in the Red Sea, in which the Israelites are also represented returning thanks for their deliverance; Moses receiving the Tables of the Law while the Israelites are worshipping the golden Calf; the Sermon on the Mount and the Healing of the Leper; and the Last Supper. The landscape of the third picture was painted by Cosimo's pupil, the eccentric Piero di Cosimo, afterwards the master of Andrea del Sarto. These works were painted for a prize in competition with others in the same chapel by Sandro Botticelli, Domenico Ghirlandajo, Don Bartolomeo, Luca da Cortona, and Pietro Perugino. Cosimo was very anxious to get the prize, but he doubted his ability, at the same time that he had little faith in the pope's judgment; he therefore, knowing his weakness in composition and design, painted his picture very high in colour, and used plenty of ultramarine and gold, counting upon attracting the pope's fancy by his gaudy display. When the pictures were all uncovered, his fellow painters laughed at Cosimo for his puerilities. Cosimo however proved himself a good man of the world, if not a good painter; his gay works fixed the pope's attention and he obtained the prize; the other painters were censured by his holiness for not using finer colours, and they were obliged to retouch them and heighten their effect in the same manner, to the great triumph of Cosimo, whose works however were in reality inferior to all the others.

Cosimo Roselli was still living in 1506: Vasari says he was sixty-eight years old when he died; if therefore he were born in 1439,

1507 may have been the year of his death. He was the master of Fra Bartolomeo.

(Vasari, *Vite de' Pittori*, &c., ed. Schorn; Rumohr, *Italianische Forschungen*; Platner und Bunsen, *Beschreibung der Stadt Rom*, vol. ii., pt. 1; Gaye, *Carteggio inedito d'Artisti*, vol. ii., ap. 1.)

ROSELLINI, IPPOLITO, Cavaliere, was born August 13, 1800, at Pisa. His father was a merchant, and Rosellini himself was designed for his father's business; but he acquired such a love of the study of antiquities from his first tutor, Padre Battini, a Servitant monk of St. Antonio, who was a tolerable numismatist, that he commenced at an early age to give himself up to those studies for which he afterwards distinguished himself, and the mercantile career was wholly abandoned. In 1821 he finished his university studies in Pisa, and took the degree of Doctor of Theology. He afterwards studied the Oriental languages for three years with the celebrated Mezzofante at Bologna; and in 1824 he was appointed professor of Oriental languages in the University of Pisa. In 1825 he appears to have devoted himself with much zeal to the study of Egyptian hieroglyphics, following the steps of Champollion, of whose discoveries he was an ardent advocate. When Champollion, in 1826, for the further development of his system, examined the Egyptian monuments in Rome, Naples, and Turin, Rosellini, by the permission of the Tuscan government, attended him in his researches; and he accompanied him to Paris, and there spent the autumn of that year in similar researches: he published also in that year an explanation of an Egyptian monument in the gallery degli Uffizj at Florence.

In the autumn of 1827 the Grand Duke Leopoldo II. granted Rosellini a year and a half leave of absence, with funds for himself and six companions, to carry out his design of personally exploring the monuments of Egypt. After a considerable delay in Paris the French government of Charles X. determined upon sending Champollion with five companions upon a similar expedition at the same time, and they all embarked together at Toulon, July 31, 1828, and landed on the 18th of August following in Egypt, where they remained fifteen months, exploring all the principal monuments of Egypt and Nubia.

Rosellini arrived at Pisa January 6, 1830, and commenced immediately a course of lectures on the Egyptian hieroglyphics, the substance of which is in the 'Elementa Lingue Egyptiacæ' of Padre Ungarelli, published at Rome, in 1837. Rosellini had himself made his principles known in a letter to M. Peyron, in 1831. The great results of the expedition however were to appear in a joint production by Champollion and Rosellini; the former undertaking to explain all the historical monuments, and Rosellini the civil and religious. This design was however rendered impossible by the death of Champollion, which took place March 5, 1832, and Rosellini expressed his sincere regret and disappointment in a eulogium on his departed friend, which he published under the following title:—'Tributo di riconoscenza ed amore alla memoria di Champollion.' Rosellini was thus compelled to undertake the whole work himself, which was his original design, and the prospectus explaining the plan of the work had already appeared in January, 1831. Accordingly in November, 1832, appeared the first volume of 'I Monumenti dell' Egitto e della Nubia,' by Rosellini alone, explaining the historical monuments; the second appeared in 1833; and by 1836 three more, explaining civil monuments, were published; but between the publication of the fifth and sixth volumes a long interval incurred, partly through Rosellini's appointment as librarian of the University of Pisa, but chiefly through a serious illness with which he was afflicted in the chest, and which incapacitated him for nearly two years. At the same time, with the above volumes of letter-press, appeared two large folios of illustrations, the historical monuments were completed in 1832, and the civil in 1834. The description of the historical monuments was completed in 1838-41, in two volumes, the third being divided into two parts, making in all four volumes in five on the historical, and three on the civil monuments, and these were all that were published during Rosellini's lifetime. The remaining part were the religious monuments of the Egyptians, which he was occupied upon until the period of his death, and though he did not live to see the publication, he completed the manuscript of this part.

In 1839 he gave up the professorship of Oriental languages and commenced a series of archaeological lectures; but in 1841 these labours were remitted him on account of his extremely bad health, and in order that he might bestow what time he could devote to study to the completion of his great work on Egypt. On the 16th of May, 1843, however, his case was found hopeless, and he died on the 4th of June following, in his forty-third year. The third part of the work was published in 1844, under the direction of the professors Bonaini and Severi, in one volume of illustrations and one volume of text.

This great work on Egypt may be thus briefly described:—its title is—'I Monumenti dell' Egitto e della Nubia disegnati dalla Spedizione Scientifico-Letteraria Toscana in Egitto, distribuiti in Ordine di Materie, interpretati ed illustrati del Dottore Ippolito Rosellini.'—The Monuments of Egypt and of Nubia drawn by the Tuscan Literary and Scientific Expedition in Egypt, arranged according to their Subjects, and explained and illustrated by Dr. Ippolito Rosellini. It is in three parts, each of which is in one large folio volume with illustrative letter-press in octavo. The first volume, Tavole, M. R.,

contains the historical monuments, 'Monumenti Storici,' in 169 plates, with four volumes of text, 1832-41; the second, *Tavole M. D. C.*, contains the civil monuments, 'Monumenti Civili,' in 135 plates, with three volumes of text, 1834-36; and the third, *Tavole, M. D. C.*, the monuments of religious worship, 'Monumenti del Culto,' in 86 plates, with one volume of text, 1844. Rosellini bequeathed his Egyptian manuscripts to the University of Pisa; the drawings and plates are all the property of the Grand Duke. Among the manuscripts is a voluminous but unfinished 'Diccionario Geroglyphico' ('Hieroglyphic Dictionary'), with several thousand names.

ROSEN, FREDERIC AUGUSTUS, was born on the 2nd of September 1805, at Hanover. He received his earliest education from his father, who held a high official situation in the government of the prince of Lippe Detmold. He afterwards went to the gymnasium at Göttingen. In the year 1822 Rosen went to the university of Leipzig, and two years afterwards to Berlin. The energy with which he applied himself to all branches of science and literature, and his great powers for acquiring knowledge, encouraged his friends to form the highest expectations of his future career. At an early period he had become distinguished for his classical attainments and his knowledge of the Semitic languages; but it was not until the year 1824 that he turned his attention to the Sanskrit, a language which at that time was almost unknown in Germany, although its importance in all questions connected with the early history of civilisation had been pointed out by the two Schlegels, Creuzer, and William von Humboldt. During a short visit which he paid to his family, he made himself acquainted, with his father's assistance, with the ancient language of the Brahmins, in which he received further instruction at Berlin from Professor Bopp, who had just returned from London, and been appointed professor of Sanskrit at the University of Berlin. William von Humboldt, who devoted his time to the same pursuits, also encouraged him to proceed in his Sanskrit studies. The total want of all useful aids towards obtaining a knowledge of this difficult language, suggested to Rosen the idea of supplying the deficiency, which his acquisitions rendered him well able to do. Accordingly, in 1826, when he took his degree of doctor of philosophy, he published his 'Corporis Radicum Sanscritarum Prolusio,' which was only the forerunner of his larger work, 'Radices Sanscritae,' Berlin, 1827. This work, which abounds in learning and sound criticism, has contributed more than any other to recommend and facilitate the study of the Sanskrit language in Germany. Rosen also had applied himself with the greatest success to the study of Arabic and Persian; and he had prepared for publication several large episodes of the 'Sháh Náhmah,' the great epic poem of the Persians. This intense application to the literature and the languages of the East gave birth to a strong desire to visit Asia. A favourable opportunity presented itself, and he was appointed attaché to the Prussian embassy at Constantinople. Shortly before he started however he received a flattering invitation to become Professor of Oriental Languages in the University of London (now University College), then just established. He accepted the offer, hoping to find in this country a wide field for his literary labours. Before going to London he visited Paris, in order to become acquainted with De Sacy, Remusat, and De Chézy; and after a short stay in that city he came to London. But his expectations of honour and profit were greatly disappointed; for though he had a few pupils in Sanskrit, Arabic, and Persian, it soon became evident that a teacher of the Hindustani language was more wanted at the London University than a professor of Oriental languages as the term is understood in Germany. His energy did not however fail him; and seeing that he could be useful in a secondary capacity, he applied himself for several months with great industry to the Hindustani, in order that he might qualify himself to teach the language. Some years afterwards he resigned his professorship of Oriental languages, but subsequently accepted the Sanskrit professorship in University College. The high opinion which the College entertained of his services may be collected from the 'Annual Report' of the College for the year 1837-38, which was made after his death.

He derived more satisfaction from his occupation as honorary foreign secretary of the Royal Asiatic Society, and as secretary to the Oriental Translation Committee, then just established. This brought him into communication with that great oriental scholar, Colebrooke, for whom he entertained the highest admiration. By Colebrooke's advice he published, under the sanction of the Translation Committee, the Arabic text of the 'Algebra' of Mohammed ben Musa, with an English translation, accompanied with excellent notes [MUSA]; he also prepared for publication the great 'Biographical Dictionary' of Ibn Khallikan; but this, as well as another work, in which he intended to give a comprehensive view of the system of Indian jurisprudence, was never completed.

Amidst these various occupations he had not lost sight of a higher and more arduous task, in which he wished to concentrate all his attainments. Having discovered that the character of the Indian literature and language could only be completely understood by tracing them back to the earliest periods to which the 'Vedas' belong, he desired to remove the obscurity by which they are surrounded. In 1830 he published his 'Rig Vedae Specimen' (Taylor, London), and from that time his principal attention was directed to this great object, in order to understand the obsolete languages of these ancient writings,

he had to study the oldest of the grammatical works of the Hindus. Having done this, he applied himself to the Commentaries, without a full knowledge of which the texts are quite unintelligible. All this was done under very disadvantageous circumstances, and it is a matter of great regret that he was not placed in a situation which would have made other labour unnecessary.

Among his various literary labours at this period was the revision of the 'Dictionary, Bengali, Sanscrit, and English,' published by Sir Graves Houghton, London, 1833-34. He also made the 'Catalogus Codicum Manuscriptorum Syriacorum et Carshunicorum in Museo Britannico,' which has been published, since his death, under the care of the Rev. Mr. Forshall, who, in his address to the reader, has justly attributed to Dr. Rosen all the merit of this catalogue. Unfortunately, Dr. Rosen's name does not appear either on the title-page of this catalogue, nor after the præfatio which he wrote, and which is printed at the head of the catalogue. To qualify himself for this labour, Rosen made himself master of the Syriac language, with which he was hitherto imperfectly acquainted. At Colebrooke's request he undertook the collection of his 'Miscellaneous Essays,' to which he added an excellent index, 2 vols., London, 1827. He also wrote all the articles relating to Oriental literature in the 'Penny Cyclopædia,' from the article 'Abbasides' to the article 'Ethiopian Language,' both included, together with several articles on Eastern geography, such as 'Arabia' and 'Armenia.' He revised the work on the Hindus, which was published in the 'Library of Entertaining Knowledge;' the chapter on the literature is entirely by his hand. For the 'Journal of Education' he wrote a review of Bopp's 'Vergleichende Grammatik,' &c. (vol. viii.), and two reviews of Pott's 'Etymologische Forschungen' (vols. ix., x.). He maintained a constant correspondence with almost all the distinguished scholars on the Continent, and for the last ten years of his life no important publication connected with Eastern philology or history was projected on the Continent to which he did not contribute either by his advice or by the supply of materials. His worth was fully appreciated on the Continent, and a desire was often expressed that he should return to his native country; but being anxious to accomplish his design of publishing the 'Vedas,' and conceiving that he was placed in a wider sphere of utility in England, he preferred remaining in London, where he found such valuable treasures of Oriental literature.

In the year 1836 he began to print the collection of the hymns of the 'Rig Veda,' giving the Sanskrit text, a Latin translation, and explanatory notes. In the autumn of 1837 he had advanced so far that he intended to publish a first volume, when his sudden death, on the 12th of September 1837, in the prime of life and in the full vigour of his intellectual powers, interrupted an undertaking for which no man in Europe was so well qualified or prepared as himself. The Translation Committee published the book after his death, as far as it was completed, under the title 'Rig Veda Sanhita Liber Primus, Sanscrit et Latine,' 4to, London, 1838. Those who may hereafter profit by the study of this work, should know at what price it has been obtained: it is only a fragment, but it contains the energy of a whole life. Rosen's posthumous papers and collections were confided for publication to the able hands of Professor Lassen of Bonn.

Although Rosen had acquired so honourable a rank as an Oriental scholar, his position in society was no less distinguished. The highest admiration for his talents and attainments was accompanied with universal respect for his virtues. The simplicity of his pure and elevated mind, the gentleness of his manners, and, above all, the genuine kindness of heart which formed the striking feature of his character, secured for him, in an eminent degree, the affection of all who knew him. His readiness on all occasions to aid and advise his literary friends, at any cost of labour, is well known to many who will read this notice.

The loss of such a man was severely felt by all who were interested in the studies to which he had dedicated his life, but especially was he mourned by those who were intimately acquainted with him. His numerous friends, both English and German, presented his father with a marble bust of his son, by Richard Westmacott, as a mark of their esteem for his character and regret for his loss, and erected a monument to his memory in the cemetery at Kensall Green, near London, where he was interred.

ROSENMÜLLER, JOHN GEORGE, was appointed professor of divinity in the University of Leipzig, and superintendent in the Lutheran church at the same place in 1785, and died in 1815. His chief works are:—1, 'Historia Interpretationis Librorum Sanctorum in Ecclesia Christiana, ab Apostolorum Aetate ad Literarum Institutionem,' 5 parts, 8vo, 1795, 1814; and 2, 'Scholia in Novum Testamentum,' 5 vols. 8vo. The latter is a useful work, especially for young students, but the author cannot be placed in the first rank of commentators. His labours were more directed to the explanation of particular words and phrases than to the general comprehension of the sacred writings. He seldom gives a satisfactory solution of any formidable difficulty.

ROSENMÜLLER, ERNEST FREDERIC CHARLES, son of the preceding, was born in 1768, and died on the 17th of September 1835, after having for many years held the office of professor of oriental languages in the University of Leipzig. His chief works are:—1, 'Scholia in Vetus Testamentum,' 23 vols. 8vo, which is a philological

and exegetical commentary on the Pentateuch, Isaiah, the Psalms, Job, Ezekiel, the minor prophets, Jeremiah, the writings of Solomon, Daniel, Joshua, Judges, and Ruth. The first edition was published 1795-1826, the second 1823-34. In the second edition several Rationalistic interpretations which appeared in the first are greatly modified. Rosenmüller's profound oriental learning and untiring industry have made this work one of the most valuable commentaries upon the Old Testament. In some cases he leans too much to the interpretations of the Jewish Rabbis. A 'Compendium of the Scholia,' in 5 vols. 8vo, containing the Pentateuch, Isaiah, the Psalms, Job, Ezekiel, and the minor prophets, has been executed by Dr. J. C. S. Lechner, under the author's superintendence. Rosenmüller did not live to complete his larger work. 2, 'Handbuch der Biblischen Alterthumskunde,' 4 vols. 8vo, 1823-31. This work was also left incomplete at the author's death. The volumes published were three on the geography and one on the natural history of the Bible. Translations of parts of this work are published in the 'Biblical Cabinet,' namely, 'The Geography of Central Asia,' 2 vols., and 'The Mineralogy and Botany of the Bible,' 1 vol. 3, 'Institutiones Linguae Arabicae,' the best manual of Arabic grammar, chiefly founded upon De Sacy's 'Grammaire Arabe.' 4, 'Analecta Arabica.' 5, 'Vocabularium Veteris Testamenti.' 6, 'Das Alte und das Neue Morgenland,' 6 vols. 8vo.

ROSMINI, CARLO DE' was born in 1758 at Roveredo, in the Italian Tyrol. He studied first at Innsbruck, and then in his native town, where he began early to show his aptitude for literary composition by writing several disquisitions on poetry. He afterwards removed to Ferrara, where he published in 1789 a *Life of Ovid*:—'*Vita di Ovidio Nasone*,' to which were added a letter by Vannetti on the style and the language of Ovid, and a parallel between the Orpheus of Ovid and the same character in Virgil. This work obtained for Rosmini the honour of being inscribed among the members of the Florentine academy. He next wrote '*Della Vita di L. Anneo Seneca libri quattro*,' Roveredo, 1793. In 1801 he wrote an account of Vittorino da Feltre, a celebrated preceptor of the 15th century, and of his system of education, '*Idea dell' ottimo Precettore nella Vita e Disciplina di Vittorino da Feltre e de' suoi Discepoli*.' This book may be called a treatise on pedagogy, as well as the next work published by Rosmini on Guarino Veronese, a contemporary of Vittorino da Feltre, and upon his school, '*Vita e Disciplina di Guarino Veronese e de' suoi Discepoli*,' 3 vols. 8vo, Brescia, 1805-6. In 1808 Rosmini published an elaborate biography of the learned Filelfo, '*Vita di Francesco Filelfo da Tolentino*,' 3 vols. 8vo. His next work was a *Life of Trivulzio*, a great captain of the 16th century, '*Dell' Istoria intorne alle Militari Imprese ed alla Vita di Gian Jacopo Trivulzio detto il Magno Libri XV.*,' 2 vols. 4to, 1815, a biography enriched with handsome engravings and valuable documents. The last work of Rosmini was his history of Milan, '*Dell' Istoria di Milano Libri XVIII.*' This history embraces the period from the reign of Frederic Barbarossa down to 1535, when Milan was annexed to the dominions of Charles V. The author wrote a continuation of it down to the beginning of the reign of the Empress Maria Theresa in 1740, which continuation is still inedited. Rosmini ranks among the principal Italian biographers of our times. He died at Milan in 1827.

ROSS, REAR-ADMIRAL SIR JOHN, Knight, was born June 24, 1777, at Balsarroch, Wigtownshire, Scotland. He was the fourth son of the Rev. Andrew Ross, of Balsarroch, minister of the parish of Inch. He entered the navy as a first-class volunteer November 11, 1786, on board the *Pearl*, 32 guns, and served in the Mediterranean till 1789. From November 7, 1790 till 1791, he served on board the *Impregnable*, 98 guns, in the English Channel. After being some years in the merchant-service he became, in September 1799, a midshipman on board the *Weazel*, sloop-of-war, which in that year formed part of the expedition to the coast of Holland. After having served on board several other king's ships, he received his commission as lieutenant, March 13, 1805. While attached to the *Surinam*, 18 guns, in 1806, he was severely wounded in four places in cutting out a Spanish vessel under the batteries of Bilbao, for which, in 1808, he was granted a pension of 98*l.* a year, increased in 1815 to 150*l.* He attained the rank of commander February 1, 1812, and was appointed to the *Briseis*, sloop-of-war, and afterwards to other vessels, till the termination of the war in 1815, during which period he performed several valuable services. He married his first wife in 1816.

In December 1817, while in command of the *Driver*, sloop-of-war, in Loch Ryan, on the coast of Scotland, he received a letter from Sir George Hope, one of the Lords of the Admiralty, informing him that two ships were to be sent out, to "ascertain the existence or non-existence of a north-west passage;" and inquiring whether he was disposed to undertake the command of the expedition. Having expressed his willingness to do so, he was directed to repair to London, where he arrived on the 30th of December. On the 15th of January 1818, he received his commission as commander of the *Isabella*, 385 tons, Lieutenant W. E. Parry being appointed to the command of the *Alexander*, 252 tons. The two ships departed from the Thames, April 25, 1818. They sailed up the eastern side of Davis's Strait and Baffin's Bay, and returned by the western side. They entered Lancaster Sound, and after proceeding some distance up it, Ross and the officer of the watch thought that they saw "land round the bottom of the Bay, forming a chain of mountains connected with those which

extended along the north and south sides." The *Alexander*, being a slow-sailing vessel, was a considerable distance behind the *Isabella*. Parry however and his officers could see no mountains, and were greatly surprised and disappointed when the *Isabella* turned her head eastwards, and gave the signal for the *Alexander* to follow the example. Ross named the supposed high land the Croker Mountains, and has laid them down in his chart as a continuous chain closing up the bottom of the supposed bay. This was a mistake, as Parry believed at the time, and as he proved the following year when he sailed through Lancaster Sound into Barrow's Strait. [PARRY, SIR WILLIAM EDWARD.] The ships arrived in the Thames on the 14th of November, 1818. On the 7th of December, the same year, Ross was advanced to the rank of post-captain. In 1819 he published '*A Voyage of Discovery, made under the Orders of the Admiralty, in his Majesty's ships Isabella and Alexander, for the purpose of exploring Baffin's Bay, and enquiring into the Probability of a North-West Passage*,' 2 vols. 8vo.

After the unsuccessful attempt of Captain Parry to reach the north pole, in 1827, Captain Ross submitted to the Lords of the Admiralty and to the Lord High Admiral the plan of another voyage of discovery to the Arctic seas. The government however did not undertake it; but after some delay a steam-ship was equipped at the expense of Mr. Felix Booth (afterwards Sir Felix Booth), then sheriff of London. The ship was named the *Victory*, and was fitted with an engine, invented and patented by Messrs. Braithwaite and Ericsson, which proved to be so bad as to be almost useless. Commander James Clark Ross, nephew of Captain Ross, was chosen as second in command. They had an attendant vessel of 16 tons burden, granted to them by the Admiralty, named the *Krusenstern*. The *Victory*, with its attendant, left the Thames May 24, 1829, and using partly her sails, and partly her "execrable machinery," as Ross calls it, entered Davis's Straits, July 5. Captain Ross expected to find a north-west passage through Prince Regent Inlet, which Parry had discovered, and in which one of his ships, the *Fury*, had been wrecked. The *Victory* and the *Krusenstern* entered the Inlet on the 12th of August, and on the following day discovered the wreck of the *Fury*. They afterwards took such of her stores as they required, passed farther down the Inlet, and on the 8th of October were frozen up in Felix Harbour, on the west side of the Gulf of Boothia. They were not released from the ice till the 17th of September 1830, and were able to advance but a very short distance before they were again frozen up on the 31st of October. On the 29th of August 1831, the *Victory* was again released from the ice, but on the 25th of September was forced by the pressure into another harbour. In April 1832 the sailors commenced carrying northwards two boats, with sledges and provisions, and on the 29th of May the vessels were finally abandoned. Captain Ross, in his journal, observes, "In the evening I took my own adieu of the *Victory*. It was the first vessel that I had ever been obliged to abandon, after having served in thirty-six, during a period of forty-two years." Some of the crew had died, and the rest were much weakened, but they struggled on till the 15th of August 1833, when the ice broke, and they were enabled to set sail in the boats. On the 26th of August, when near the entrance of Lancaster Sound, they came in sight of the *Isabella*, which was out on a whaling voyage. The mate in command of a boat that was sent to them, on Captain Ross asking him the name of the vessel, said it was the *Isabella* of Hull, once commanded by Captain Ross, "on which I stated that I was the identical man in question, and my people were the crew of the *Victory*." Unshaven as they all were, dirty, dressed in tattered skins, and wasted almost to the bones, the man doubted the statement, and said that Captain Ross had been dead two years. He was easily convinced of his error, and they were received on board the *Isabella*, with the yards and rigging manned, and with three hearty cheers. The *Isabella* arrived at Hull on the 18th of September 1833, and on the 19th Captain Ross reached London by steamer.

While the ships were frozen up in the Gulf of Boothia, many journeys and surveys were made by Commander Ross, and some by Captain Ross himself, chiefly of the coasts and country which they named Boothia Felix. During one of these journeys Commander Ross discovered, June 1, 1831, a spot which he considered to be the north magnetic pole, 70° 5' 17" N. lat., 96° 46' 45" W. long., where the dipping needle indicated a dip of 89° 59', or within one minute of the vertical.

On the 24th of December 1834, Captain Ross received the honour of knighthood, together with the companionship of the Bath. Many other honours and several rewards were conferred upon him. In 1835 he published a '*Narrative of a Second Voyage in Search of a North-West Passage, and of a Residence in the Arctic Regions during the years 1829, 1830, 1831, 1832, 1833, by Sir John Ross, C.B., &c., Captain in the Royal Navy, including the Reports of Commander (now Captain) James Clark Ross, R.N., F.R.S., F.L.S., &c., and the Discovery of the Northern Magnetic Pole*,' 4to, with Maps and Plates. In the same year was published an '*Appendix to the Narrative*,' &c., also in 4to, chiefly consisting of accounts of the Esquimaux, and of the zoology, the meteorology, and similar matters. On the 8th of March, 1839, Sir John Ross was appointed consul at Stockholm, where he remained till February 1845. In 1850 he went out in search of Sir John Franklin, in a small vessel of 90 tons, named the *Felix*, and remained one winter in the ice. The government lent him no assist-

ance, and early in 1855 he wrote a pamphlet, in which he complained of his own treatment, and blamed Sir John Richardson and others. The pamphlet is entitled 'A Narrative of the Circumstances and Causes which led to the Failure of the Searching Expeditions sent by government and others for the Rescue of Sir John Franklin,' 8vo.

Sir John Ross's first wife having died in 1822, he married a second, October 21, 1834. By his first wife he had issue one son, who is a magistrate at Cawnpoor in Hindustan. Sir John Ross is the author of 'Letters to Sea-Officers,' 'Memoirs and Correspondence of Admiral Lord de Saumarez,' a 'Treatise on Navigation by Steam,' and other smaller works. He attained the rank of Rear-Admiral July 8, 1851, and died in London August 30, 1856.

\*ROSS, SIR JAMES CLARK, Knight, Captain in the Royal Navy, was born April 15, 1800, in London. He is a son of George Ross, Esq., of London and Balsarroch, and is nephew of the late Rear-Admiral Sir John Ross, treated of in the preceding article. He entered the royal navy April 5, 1812, as a first-class volunteer, on board the *Briséis*, commanded by his uncle Captain John Ross. He continued to serve under his uncle as midshipman and master's mate, in other ships, in the Baltic, the White Sea, and on the coast of Scotland. He accompanied Captain John Ross in the *Isabella*, as an admiral's midshipman, on his first voyage in search of a north-west passage. [ROSS, REAR-ADMIRAL SIR JOHN.] On his return he joined the *Severn*, 40 guns, lying in the Downs. From January 1819 to October 1825 he was engaged under Captain Parry in his three voyages in search of a north-west passage, and while absent on the second was promoted, Dec. 26, 1822, to the rank of lieutenant. In the third voyage he was on board the *Fury* when that ship was wrecked in Prince Regent Inlet. In 1827 he again accompanied Captain Parry in his attempt to reach the North Pole. [PARRY, SIR WILLIAM EDWARD.] On his return to England he received a commission as commander, Nov. 8, 1827. From 1829 till 1833 he served under his uncle Captain John Ross, in his second voyage in search of a north-west passage; and his valuable services during that period, including the discovery of the northern magnetic pole, were rewarded by his elevation to the rank of post-captain, Oct. 28, 1834. In 1835 he proceeded to Baffin's Bay for the purpose of searching for some missing whalers, and conveying relief to them. He was subsequently, till 1838, employed by the Admiralty in making a magnetic survey of Great Britain and Ireland.

Captain James Clark Ross, on the 8th of April 1839, was appointed to the command of the *Erebus*, bomb, 370 tons, and of an expedition to the Antarctic Seas. He was accompanied by Commander Francis Rawdon Moira Crozier, in command of the *Terror*, 340 tons. The chief purpose of the expedition was magnetic investigation, as to the lines of variation, the dip, and the intensity, and also as to the position of the southern magnetic pole or poles. The two ships sailed from the mouth of the Thames Sept. 30, 1839, and anchored off Folkestone, on their return, Sept. 4, 1843. During this voyage of four years, besides the investigations in magnetism and meteorology, many valuable additions were made to the previous knowledge of the Antarctic Regions and Seas in geography, geology, zoology, and botany. Three persevering attempts were made to reach the South Pole, and the ships succeeded in reaching the latitude of  $78^{\circ} 10'$ , or about 157 miles from the Pole. A vast continent was discovered, bordered with a barrier of ice 150 feet high, to which they gave the name of Victoria Land. An active volcano was seen, which they named Mount Erebus, in  $77^{\circ} 32'$  S. lat.,  $167^{\circ} E.$  long., 12,000 feet in height, and in the midst of perpetual snow. Only four men were lost during the voyage—three by accident and one by illness.

Captain James Clark Ross after his return married Oct. 8, 1843. In 1844 he received the honour of knighthood, and also the honorary degree of D.C.L. from the University of Oxford. In 1847 was published 'A Voyage of Discovery and Research in the Southern and Antarctic Regions, during the years 1839-43, by Captain Sir James Clark Ross, Knt., R.N., D.C.L. Oxon., F.R.S., &c., with Plates and Woodcuts,' 2 vols. 8vo. On the 31st of January 1848, Sir James C. Ross was appointed to the *Enterprise*, and made a voyage to Baffin's Bay in search of Sir John Franklin, which was, like the other searching voyages, unsuccessful.

Sir James C. Ross, who is skilled in astronomy, magnetism, meteorology, zoology, botany, and other sciences, has received many testimonials of his merits. In 1823 he was elected a Fellow of the Linnæan Society, and Dec. 11, 1823, a Fellow of the Royal Society. He is also a Fellow of the Royal Astronomical Society and the Royal Geographical Society, and is a corresponding member of several foreign societies. In 1833 he received the thanks of the common council of the city of London; in 1841 he was presented with the founder's gold medal by the London Geographical Society, and in 1842 with the gold medal of the Geographical Society of Paris.

\*ROSS, SIR WILLIAM CHARLES, R.A., was born in London June 3, 1794. From his birth he was in a measure dedicated to art. His father was a miniature-painter and teacher of drawing; his mother, the sister of Anker Smith the engraver, was also an artist of some ability. Under their instruction and influence he had made sufficient progress to enter the Royal Academy as a student when only ten years old. In his thirteenth year (1807) he gained a silver palette at the Society of Arts for a copy in chalk of Smith's engraving of the 'Death of Wat Tyler;' and in each of the four following years he received

other prizes from the same society: in 1808 the silver medal and 20*l.* for an original drawing of the 'Judgment of Solomon;' in 1809 the large silver palette for a miniature of 'Venus and Cupid;' in 1810 the silver medal and 20*l.* for an original drawing of 'Samuel presented to Eli;' and in 1811 the silver medal for an original drawing of the 'Triumph of Germanicus.' Again in 1817 he obtained the Society's gold medal for an original painting, 'The Judgment of Brutus;' he also gained the silver medal of the Royal Academy for an academical drawing. ('Art-Journal,' Feb., 1849.)

Mr. Ross commenced his professional career as a painter of portraits and historical and poetical subjects of the order indicated in the titles just given. But he soon felt that only the promise of extraordinary success would justify him in devoting his life to the higher department of art, while there appeared to be a favourable opportunity for the application of superior knowledge and technical skill to what was generally regarded as a very inferior though popular branch—that of miniature. He accordingly became a miniature-painter, and he soon found his reward in a steady influx of patronage, which went on increasing until he became the admitted head of that line of art. During his long career as the favourite painter of the court and aristocracy, it has fallen to his lot to paint most of the members of the royal family from the Queen downwards, and the élite of the aristocratic and fashionable world, as well as many members of foreign royal and noble families; it would therefore be idle to attempt to enumerate his works. As to their style it may suffice to say, that bringing to miniature-painting the knowledge acquired in the study of the higher walks of art, he was able to do something to elevate its general character; and though in Sir William Newton, Thorburn, and a few others, he has found worthy rivals, it may fairly be said that to his example even his most successful competitors owe not a little of their own excellence. The miniatures of Sir William Ross invariably exhibit admirable drawing and careful execution; a good, though it may be somewhat refined likeness; charming general colour, while the carnations are almost unequalled among miniature-painters; and the utmost taste in the arrangement of the whole.

Sir William Ross was appointed miniature-painter to the Queen in 1837; in 1838 he was elected A.R.A.; in February 1842 he became R.A.; and in the following June he received the honour of knighthood. It should be mentioned that though Sir William early abandoned historic for miniature painting, he did not lose either his interest or his skill in the former. When the first great Cartoon competition in connection with the decoration of the new houses of parliament was announced, Sir William sent to Westminster Hall a cartoon 10 feet 8 inches square, representing 'The Angel Raphael discoursing with Adam,' which attracted considerable notice, and obtained one of the additional premiums of 100*l.*

\*ROSSE, WILLIAM PARSONS, THIRD EARL OF, was born in 1800. He was educated at Magdalen College, Oxford, and graduated first class in mathematics in 1822. As Lord Oxmantown, he represented King's County in parliament from 1821 to 1834. His father, the second earl, died in 1841, when Lord Oxmantown succeeded to the peerage. In 1845 he was elected one of the representative peers for Ireland. Lord Rosse's chief distinction however has arisen from his service to astronomical science, by the series of researches and experiments which resulted in the construction of the magnificent telescope set up on the lawn in front of his residence, Birr Castle, near Parsonstown, in King's County. The lenses of this enormous instrument were formed and the whole of the instrument constructed under his lordship's personal superintendence. The very beautiful contrivances for insuring the perfect stability and at the same time the easy movement of the vast instrument were also invented by his lordship. Years of anxious experiments, and a large amount of money, were expended by Lord Rosse in preparing the specula, on the perfection of which depended the accuracy of the observations which might be made by the telescope, and in constructing and fitting up the instrument. This unrivalled telescope has been found, as was expected, to possess a far greater amount of space-penetrating power than any previous instrument, and several nebulae, which had hitherto proved impermeable, have been readily resolved by it, and great advance has consequently been made in our knowledge of these objects. A much more minute and specific knowledge has also been obtained of the visible surface of the moon. The prospect of new observations of many other celestial phenomena and remarkable appearances of the heavenly bodies is also of course opened up by the adoption of instruments of such vast power as the results of Lord Rosse's experiments have shown to be practicable.

Lord Rosse married in 1836 the eldest daughter of John Wilmer Field, Esq., of Heaton Hall, Yorkshire. In 1843 he was president of the British Association; and in 1849 he was elected president of the Royal Society. He is also a member of the Imperial Academy of Sciences at St. Petersburg, and of other learned societies. At the close of the French Exhibition of 1855, the decoration of a Knight of the Legion of Honour was conferred on Lord Rosse in consideration of his services to astronomical science.

Lord Rosse has published the following:—'The Monster Telescope erected by the Earl of Rosse, Parsonstown, with an account of the Manufacture of the Specula, and full descriptions of the Machinery,' printed at Parsonstown in 1844; 'Letters on the State of Ireland,'

1847; 'Memorandum presented to the Council of the Royal Society for rendering the Council of the Society more efficient,' in a letter of Sir J. South to the Royal Society, privately printed in 1856.

ROSSI, JOHN CHARLES FELIX, R.A., was born in 1762 at Nottingham, where his father, a native of Siena, though not a licensed practitioner, practised as a medical man. Young Rossi was apprenticed very early to a sculptor of the name of Luccatella, with whom he remained, after he had served his time, as a journeyman, at 18s. per week; but being employed by his master to correct some work on which Luccatella's principal assistants had been engaged, he suspected that his own abilities were of a superior class, and he demanded and obtained higher wages. It was now however, having once felt the longing for praise, impossible for him to remain in his then subordinate situation, and he determined upon trying to better himself in London. There, still a boy, he entered himself as a student of the Royal Academy; and in 1781 he obtained the silver medal, and in 1784 the gold one, which entitled him to three years' maintenance at Rome. He went to Rome in 1785; in 1788 he returned to London; in 1800 he was elected an associate of the academy; and only two years afterwards, a very short interval, he was elected an academician. He was subsequently appointed sculptor to the Prince Regent, and he was employed in decorating Buckingham Palace. He was afterwards sculptor to William IV. But his celebrity had passed away, and he had little to do after the completion of his great public monuments in St. Paul's cathedral. In the latter years of his life he depended chiefly upon a pension from the Royal Academy. He died February 21, 1839. He was twice married, and had eight children by each wife.

Rossi was both a classical and a monumental sculptor, and his style was manly and vigorous, especially in his monumental works, but they are not remarkable for any refinement either of sentiment or execution. Of the first class the following may be mentioned:—A Mercury in marble, executed in Rome; a recumbent figure of Eve, in marble; Edwin and Eleanora; Celadon and Amelia; Musidora; Zephyrus and Aurora; and Venus and Cupid. A statue of Thomson the poet by him is in the possession of Sir Robert Peel; and there is a large colossal statue of Britannia on the Exchange at Liverpool. His best works however, and those by which he is and will be known, are the following monuments in St. Paul's cathedral:—The Marquis Cornwallis, in the nave; Captain Faulkner and Lord Heathfield, in the south transept; and Captains Mosse and Riou, and Lord Rodney, in the north transept. The principal of these are those to Lords Cornwallis, Heathfield, and Rodney, and Captain Faulkner; all of which, except the second, are groups of three or more figures of the heroic size. That to Lord Cornwallis is placed opposite to Flaxman's monument to Nelson, and is in a similar style of composition and on a similar scale: it is a pyramidal group, the Marquis, as a Knight of the Garter, on a pedestal forming the apex; below are three allegorical figures—Britannia, and impersonations of the Begareth and Ganges, representing the British empire in the East. The sitting male figure or Ganges has much grandeur of form. Lord Heathfield is a single statue, represented in his regimentals: on the pedestal is an alto-rilievo of Victory descending from a castellated rock to crown a warrior on the sea-shore with laurel. Against the same pier is the monument to Captain Faulkner, R.N., who was killed on board the *Blanche* frigate in 1795: Neptune, seated on a rock, is in the act of catching the naked figure of a dying sailor; Victory is about to crown him with a laurel. Lord Rodney's monument is a pyramid group, the statue of the admiral forming the apex; below is Fame communicating with History. As will be seen, he depended mainly for religious sentiment and poetic effect on the admixture of allegory borrowed from classical mythology with literal fact, which was so favourite a practice with the sculptors of the 18th and early part of the present century, but which appears very difficult to reconcile with the requirements of monumental works in a Christian temple, or with common-sense.

ROSSI, ROSSO DE', or IL ROSSO, called in France, 'Maitre Roux,' a celebrated Florentine painter, was born in Florence in 1496. He studied the works of Michel Angelo, and was distinguished for the boldness and freedom of his style. He executed several works in various cities of Italy, but his paintings are not numerous in Italy, as he passed the best portion of his career from about 1538 in the service of Francis I. at Fontainebleau, where he superintended all the works of the palace, with a princely allowance, and a house in Paris, given to him by Francis. In the year 1541 however, while still at Fontainebleau, a few hundred ducats were stolen from him, and he accused his friend and assistant Francesco Pellegrini of the theft, who was put to the torture and was declared to be innocent. Rosso's sorrow for what had happened, and the taunts of Pellegrini and his friends together, annoyed him to that extent that he poisoned himself, to the great astonishment and grief of Francis and his own pupils and assistants. He is said to have been called Il Rosso on account of his red hair: he was remarkable for his large and handsome person and general accomplishments and acquirements. Rosso was the boldest painter that had appeared in Italy up to the time of Vasari. Very few of his works were left at Fontainebleau; many of them were destroyed by his successor Primaticcio. Many of his works have been engraved. (Vasari, *Vite de' Pittori*, &c.; *Lettere Pittoriche*; D'Argenville, *Vies des Peintres*.)

\*ROSSINI, GIOACCHINO, the greatest dramatic composer of the

present century, was born on the 29th of February, 1792, at Pesaro, a little town near Bologna. His father was a horn-player in the orchestras of strolling theatrical companies, and his mother was a second-rate actress and singer. Young Rossini began his career by playing second horn to his father when he was only ten years old, and thus gained an acquaintance with opera music and opera business. Having a beautiful voice, his father had him taught singing by an eminent professor. He sang the treble parts as a choir-boy in the Bologna churches, and very soon became an excellent singer and a skilful accompanist. The breaking of his voice put an end to his occupation as a chorister; and at the age of fifteen he was admitted into the Lyceum of Bologna, and received lessons in counterpoint from the learned Padre Mattei. He did not take kindly to the severe duties imposed on him by his master; his temperament was too ardent and volatile for the drudgery of double counterpoint, fugues, and canons. Mattei, having told his pupils one day, that simple counterpoint, which they had been hitherto studying, might suffice for music in the free style, but that deeper knowledge was necessary for the composition of ecclesiastical works, the quick-witted youth instantly caught at the remark: "Do you mean to say, Padre, that, with what I have learned already, I could write operas?" "Why, yes," was the answer. "Well, then," rejoined Rossini, "I mean to write operas: and I don't want any more lessons." And thus ended the young musician's scholastic education. But, in truth, he educated himself, and was indefatigable in his labour of self-instruction. He gave his days and nights not only to the great composers of the Italian musical stage, but to the German masters, who were then neither appreciated nor understood in Italy. To Mozart he especially devoted himself, and he retains to this day the deepest veneration for his illustrious predecessor. In this way he made himself a musician; and his works show his mastery of all the resources of art which are necessary for that branch of it to which he applied himself. He continued this process of self-tuition during the whole of his career. It was a course of constant progress; a progress which may be measured by comparing his first great work with his last—his 'Tancredi' with his 'Guillaume Tell.'

Before the beautiful opera which made him at once famous, he had produced several juvenile pieces, which obtained some degree of success; but they need not now be enumerated, as they have all passed into oblivion except 'L'Inganno Felice,' performed at Venice in 1812. This opera became known beyond the confines of Italy, and we once (many years ago) witnessed its representation in London. It contains some beauties; but, as a whole, it is feeble, and not worthy of preservation.

'Tancredi' was produced at Venice in 1813. No work of genius ever excited in a higher degree that sensation which the Italians so emphatically designate by the term *furor*. The susceptible Venetians were enchanted with its freshness and spirit, its noble chivalrous tone, its beautiful melodies, and brilliant yet simple accompaniments. The dilettanti exclaimed that *Cimarosa* had come back to the world. Nothing was to be heard in the saloons, the streets and public walks, the places of amusement—nay, even the courts of justice, but snatches of airs from 'Tancredi.' Its renown flew over all Italy, and over all Europe. In Germany, France, Spain, and Portugal, there was not a musical theatre, great or small, where it was not performed and received with enthusiasm, within a year or two of its first production; and in a very few years more it had crossed the Atlantic, and pursued its triumphant course over the great American continent. In short, Rossini, with his 'Tancredi,' speedily made the conquest of the whole world of music. This work indeed raised him at once to the summit of fame, and all his subsequent labours could do no more than sustain him at the same elevation.

Rossini now produced opera after opera with astonishing rapidity, but he was not for some time able again to reach the level of 'Tancredi.' 'L'Italiana in Algeri,' 'La Pietra di Paragone,' 'Demetrio e Polibio,' 'Il Turco in Italia,' and 'Aureliano in Palmira,' were all favourably received at the different theatres where they were brought out, but none of them has kept possession of the stage. 'L'Italiana in Algeri,' and 'Il Turco in Italia,' were performed at Her Majesty's Theatre; and the former was revived at the Royal Italian Opera during Mademoiselle Alboni's first season at that theatre; but neither of them proved attractive in England: as to the others, they appear to be entirely forgotten. 'Aureliano in Palmira' was successful at first, the principal character having been performed by Velluti, then in the height of his popularity. This celebrated singer, who was a great master of the 'florid' style, covered his airs with such a profusion of brilliant embellishments, that Rossini exclaimed, "Non conosco più la mia musica" ("I do not know my own music"), and, it is said, was induced by this circumstance to write his airs with all their ornaments, so as to prevent them from being spoiled by the presumption and bad taste of singers; though his expedient has not been very successful, for the favourite warblers of the day cannot be restrained from embellishing even his embellishments.

In the year 1815 Rossini was appointed musical director of the great theatre of San Carlo at Naples; a situation which he held for seven years. The first opera composed by him for Naples was 'Elisabetta Regina d'Inghilterra,' which had great success; owing, it would seem, to the manner in which the character of the queen was performed by Mademoiselle Colbrand, one of the greatest

tragedians and singers of her time, who was then in the highest favour with the Neapolitans; for the success of the opera was short-lived. No other prima-donna has distinguished herself in it; and indeed it is now almost forgotten. This lady had gained a large fortune during her brilliant career, and Rossini married her before the termination of his engagement at Naples. This engagement did not preclude him from producing operas at other places; and accordingly two pieces, 'Torvaldo e Dorliska,' and 'Il Barbiere di Siviglia,' were brought out by him, in 1816, at Rome. The first made no impression; the second is the most popular and the most charming of all his works. The drama, founded on the well-known comedy of Beaumarchais, had already been clothed with beautiful music by the celebrated Paisiello; [PAISIELLO, G.] and Rossini's adoption of the same subject was regarded as a piece of no small audacity. Under this prepossession the Roman audience, the first night, treated the new opera harshly, and would scarcely hear it to an end. On a second hearing however they reversed their hasty judgment, and did justice to the beauties of the piece. It flew over all Europe, and was received, as 'Tancredi' had been, with unbounded enthusiasm. For forty years it has enjoyed a success unparalleled in the annals of the Opera. It has been performed numberless times in every European language, and in every musical theatre, great and small, in the world; and to this day it is found to be as fresh, as delightful, and as attractive as ever.

In the following year, 1817, 'La Cenerentola' was produced at Rome, and 'La Gazza Ladra' at Milan. The former, as a whole, does not hold a very high place among the author's works. The dramatist has spoiled the pretty nursery tale of Cinderella, by divesting it of all its fanciful fairy machinery; and the heroine's part, being for a low mezzo-soprano voice, seldom finds a fitting representative. But there are highly comic scenes and pretty things in the music, so that this opera, when well-acted and sung, still continues to please. The 'Gazza Ladra' (founded on the interesting tale of the 'Maid and the Magpie') has always been one of Rossini's most favourite pieces.

From this time to the termination of Rossini's engagement at Naples in 1823, were composed his principal operas for that city. Passing over some minor pieces which have fallen into oblivion, they were 'Otello,' 'Mosè in Egitto,' 'La Donna del Lago,' 'Maometto Secondo,' and 'Zelmira.' 'Otello' notwithstanding the wretched way in which Shakspeare is mangled by the Italian playwright, has high merit as a musical work; and, with two great performers in the characters of Othello and Desdemona, never fails to succeed even in England. In 'Mosè in Egitto' there is probably more real grandeur than in any of Rossini's other productions; the famous prayer of the Hebrews when about to effect the miraculous passage of the Red Sea, is a sublime inspiration of genius. This opera has always produced a great effect, not only in its original form but in French and German versions, and it has also been received with favour in England, though, in consequence of the prohibition of Scriptural subjects on our stage, it was performed under the title of 'Pietro l'Eremita,' and more recently (at the Royal Italian Opera) under that of 'Zorah;' both transformations being equally absurd and preposterous. 'La Donna del Lago' was at first unsuccessful; but the merits of this splendid opera were soon recognised, and it still keeps possession of the stage. 'Maometto Secondo,' also failed at first, and likewise when it was reproduced three years afterwards at Venice. But a French version of it under the title of 'Le Siège de Corinthe,' was well received at Paris in 1826; and in this form, but with Italian words, it has been repeatedly performed both at Paris and London, under the title of 'L'Assedio di Corinto.' 'Zelmira' was another failure, though it contains some of Rossini's finest music, the libretto being contemptibly silly.

In 1823 Rossini left Italy, and remained for many years absent from his native country. The last opera composed by him before his departure was 'Semiramide,' which, in that year, was produced at Venice. This is the most gorgeous of his works. Its pomp and splendour are somewhat ponderous, though highly imposing, and the strength of the orchestral accompaniments is carried to an overpowering excess. But it has much real grandeur, and the character of the Assyrian queen in the hands of a great tragedian, such as Pasta or Grisi, has never failed to make a strong impression.

After a brief stay in Paris, Rossini arrived in London in 1824, in consequence of an engagement at the Italian Opera, whereby he was to be the musical director, and to produce a new opera composed for the theatre. Madame Colbrand Rossini (whom he had married before leaving Naples) was also engaged as prima donna. Immense curiosity was excited by the arrival of the far-famed maestro. But 'Zelmira,' the opera which began the season, did not please; and Madame Rossini was so coldly received that she did not re-appear. The season was attended with enormous loss, and Rossini abruptly quitted England without having fulfilled his engagement to compose an opera. If however his engagement was disastrous to the theatre, his sojourn in London was profitable to himself. He was the lion of the day; and his manners and talents as an accomplished singer 'de société,' completed the popularity in the fashionable world which his music had gained. The aristocracy loaded him with attentions, and paid him richly for accepting their invitations. Two subscription-concerts for his benefit were got up at Almack's; the admission to both was two guineas; and, as if this were not sufficient to render them exclusive, the tickets were limited to persons approved by a committee

of lady-patronesses. The concerts were of the most trivial kind, but the fashionable crowd could boast that they had heard the famous maestro himself sing a couple of comic songs. A popular idol is always subject to hostility and detraction. Many stories were industriously circulated of Rossini's arrogant and presumptuous behaviour even in the presence of royalty. They were effectually refuted at the time, and indeed were quite inconsistent with his general deportment, which has always been that of a well-bred gentleman and man of the world. The absurd homage he received from the fashionable world was no fault of his, but of those who paid it.

On his return to Paris, Rossini became manager of the Italian Opera, to which office he was appointed by the Vicomte de Rochefoucauld, the minister of the royal household; and he held it till the revolution of 1830. His indolence and want of administrative capacity made him quite unfit for the situation, and the theatre during his régime fell from a prosperous state to the brink of ruin. He neglected his art as much as his business. He composed a little opera for the coronation of Charles X., called 'Il Viaggio a Reims;' and, when it had served its temporary purpose, he employed the greater part of the music in the concoction of another opera, on a totally different subject, called 'Il Conte Ory;' a worthless piece in a dramatic point of view, though, on account of its light and pretty music, it is still occasionally performed. He adapted his old opera, 'Maometto Secondo,' to the French stage under the title of 'Le Siège de Corinthe,' as has been already mentioned; and he did the same thing with his 'Mosè in Egitto,' which was performed under the title of 'Moïse.' These were the whole of his labours from 1824 to 1829, when he produced his last and greatest opera, 'Guillaume Tell;' a work so original, so unlike anything he had ever done before, that it seemed the production of a different author. We recognise Rossini's graceful Italian melody; but in depth and solidity of style, richness of harmony, and variety of orchestral effects, 'Guillaume Tell' emulates the greatest masterpieces of the German school. This opera however has not had all the success which it deserves. The drama is ill-constructed and without interest, so that the audience become weary, notwithstanding the beauties of the music. Hence it happens that, while the airs and concerted pieces of 'Guillaume Tell' are performed at every concert, and found on every lady's pianoforte, it is seldom represented on the stage.

With this opera, at the age of seven-and-thirty, Rossini closed his career. His doing so was the result of a deliberate resolution. To his friends, who pressed him to resume his pen, he was wont to say, "An additional success would add nothing to my fame; a failure would injure it; I have no need of the one, and I do not choose to expose myself to the other." And to this determination he has adhered; for the composition of his pretty and popular, but slight 'Stabat Mater,' cannot be regarded as a departure from it.

By the revolution of 1830 Rossini was deprived of the management of the Italian Opera, and of his places of superintendent of his majesty's music, and inspector-general of singing in France—two lucrative sinecures, which he held under government. He continued nevertheless to reside in Paris, occupied in claiming compensation for the losses he had sustained, in which to some extent he succeeded. During this time he lived in a miserable lodging in the purlieus of the theatre, pretending that the utmost parsimony was necessary from the loss of his income. Nobody was duped by this piece of comedy, as his opulent circumstances were well known. In 1836 he returned to Italy, intending merely to visit his property there; but he prolonged his stay, and at length resolved to fix his permanent residence in his native country.

Since that time, we believe, Rossini has lived constantly in Bologna or its neighbourhood till last year, when he returned to Paris, where he still remains. For more than twenty years his life, though he is now only sixty-five, has been a blank, spent in self-indulgence and indolence; his habits of this kind having been increased latterly by infirm health. He is described as being still lively, kind, and good-humoured; but he takes little interest in his old pursuits, and, it is said, since his return to Paris, has never been within the doors of a theatre.

ROSTOPCHIN or RASTOPCHIN, COUNT FEDOR VASILEVICH, a Russian nobleman whose name will be always associated with one of the most striking events of modern history, was born on the 12th of March 1765, as he himself informs us in his 'Memoirs written in ten minutes.' The family of Rostopchin which established itself in Russia about three hundred years before is of Tartar origin and descended in a direct line from one of the sons of Genghis Khan. Fedor, after completing his education by a tour in Europe, became officer of the guards and gentleman of the chamber to the Empress Catherine, but attached himself to the Grand Duke Paul, with whom he became a favourite, from his sallies of somewhat eccentric humour. When the Grand-Duke became Emperor, Rostopchin rose to be adjutant-general, minister of foreign affairs, and director-general of the post, and was made a count, but he lost favour before the close of the Emperor's reign from opposing the alliance with France, was dismissed from his offices and was absent from St. Petersburg in disgrace at the time of the sudden termination of Paul's career. Under the Emperor Alexander Rostopchin became Grand-Chamberlain and was appointed General-Commander in Chief of the city and government of Moscow, and he held that post at the time when the eyes of all Europe were turned towards Moscow, on the French invasion of Russia in 1812. It was under his government that Moscow was burned.

In Napoleon's bulletins Rostopchin was denounced as having kindled the conflagration by means of three hundred incendiaries who set fire to the city in five hundred places at once, and it was stated that some hundreds of these incendiaries were taken and shot. In some French historians there are numerous details of the event, chiefly however taken from or founded on the bulletins. The belief was for years unquestioned and uncontradicted in France. At length in 1823 Rostopchin who had resided in Paris since 1817 published a pamphlet entitled '*La Vérité sur l'incendie de Moscou*' ('The Truth on the conflagration of Moscow'). "Ten years have elapsed," he commences, "since the conflagration of Moscow, and I am still pointed out to history and posterity as the author of an event which according to the received opinion was the principal cause of the destruction of Napoleon's army, of his consequent fall, the preservation of Russia, and the deliverance of Europe. Certainly there is something to be proud of in such splendid claims as these, but having never usurped anybody's rights and being tired of hearing the same fable constantly repeated I am going to make known the truth which alone ought to dictate history." . . . "It would be unreasonable," he afterwards says, "not to believe me, since I give up the finest part in the drama of our times, and pull down the edifice of my own celebrity." The gist of his statements is, that the fire was not produced by a preconcerted plan, but by the patriotism of some isolated Russians, and the negligence and violence of the French soldiers, who acted in the spirit which was shown by Napoleon's acknowledged attempt to blow up the Kremlin. "The principal feature in the Russian character," says Rostopchin, "is disinterestedness and propensity to destroy rather than give up to an antagonist—to terminate a dispute with the words, 'Then nobody shall have it.' In the frequent conversations that I had with the shopkeepers, the artisans, and the lower classes of Moscow, I often heard them say, when they expressed their fears that the city would fall into the enemy's hand, 'We ought to burn it rather.' When I was staying at the head-quarters of Prince Kutuzov, I saw many persons escaped from Moscow after the conflagration who boasted that they had set their houses on fire." It is singular that when speaking on this head the Count does not advert to his own destruction of his country-seat at the village of Voronov on the Kaluga road—a fact which admits of no doubt, for the French on arriving there found a manifesto addressed to them in French, which was made public at the time, and is reprinted in the collection of Rostopchin's writings. "During eight years," the manifesto ran, "I have been embellishing this estate, and I have lived here in happiness in the bosom of my family. The inhabitants of this village, 1720 in number, quit it at your approach, and I myself set fire to the house that it may not be polluted by your presence. Frenchmen! I abandoned to you my two houses in Moscow, with furniture in them to the value of half a million rubles—here you will find nothing but ashes." Rostopchin concludes his pamphlet, which is dated from Paris, March 5th, 1823, with the words, "I have told the truth and nothing but the truth," avoiding, it will be observed, to assert that he had told "the whole truth." "His tardy denial," remarks the writer in the '*Biographie Universelle*,' "bears no character of truth about it, and has convinced no one." Such indeed appears to be the general opinion in France; but as Rostopchin's assertions are against the interest of his own reputation, as they come into collision with no established fact, and as he had the reputation of a man of honour though a man of eccentricity, there seems no sufficient reason to reject his testimony, and it will probably be accepted by future historians unless some evidence to the contrary come to the light which is at present unknown. It is an important historical point, of more consequence than the part that Rostopchin took in the matter, that the conflagration was not the great national act that Byron represented it:—

"To this the soldier lent his kindling match,  
To this the peasant gave his cottage thatch,  
To this the merchant flung his hoarded store,  
The prince his hall—and Moscow was no more!"

In the series of Rostopchin's proclamations to the peasantry of his government, the last commences in a strange mixture of coarse humour and fierce patriotism, which seems to have been natural to him. "The enemy of the human race, God's scourge for our sins, the devil's manure, the wicked Frenchman, has got into Moscow, and has given it to sword and flame." Whatever might be the patriotism of individuals, it was evidently thought expedient to inculcate the belief in the masses that the conflagration was the work of the French.

In taking this notice of the pamphlet on the history of 1812, some of Rostopchin's biography has been anticipated. His governorship of Moscow ceased in 1814, and he accompanied the Emperor Alexander to the Congress of Vienna. In 1817 he came to Paris, where he lived for some time at what had formerly been the residence of Marshal Ney, Prince of the Moskwa, and while he was at that city in 1819 his daughter Sophia was married to Count Eugene de Ségur, grandson of the count of that name who had been ambassador at St. Petersburg, and nephew of the Count Philippe, who wrote the famous history of the invasion of Russia. Rostopchin finally returned to Russia, and died at Moscow on the 12th of February 1826.

A volume of Rostopchin's collected writings was published at St. Petersburg in 1853 in Smirdin's '*Polnoe Sobranie Sochineny Russkikh Avtorov*' ('Complete Collection of the works of Russian Authors');

they are chiefly connected with the events of his life, and derive most of their interest from that circumstance. A vein of flippancy runs through the French part of his writings, and a vein of coarseness through the Russian. His daughter-in-law, Countess Elena Rostopchin, by birth of the family of Sushkov, is a Russian poetess of some reputation.

ROTHSCHILD, MEYER ANSELM, the founder of the wealth and influence of the great commercial family of the Rothschilds, was born at Frankfurt-am-Main about the year 1750. He was originally intended for the Jewish priesthood, but was placed in a counting-house at Hanover. He returned to Frankfurt, married, and commenced business in a small way as an exchange broker and banker. His ability and industry procured him the office of banker to William, Landgrave (afterwards Elector) of Hesse. During the time that the Emperor Napoleon had undisputed possession of Germany, the landgrave's private fortune was saved by the shrewdness of his banker. Meyer Rothschild died in 1812, leaving to his five sons a large fortune, boundless credit, and an unimpeachable character. Of these the eldest, Anselm, settled at Frankfurt, Solomon at Vienna, Nathan Meyer, the third, in London, Charles at Naples, and James at Paris. They remained united, in accordance with their father's advice, and the result has been that for nearly half a century they have taken the leading part in all the financial affairs of England, France, Austria, and most other kingdoms of Europe. The rise of the Rothschilds' fortunes dates from the outbreak of the war with Spain in 1808, when the resources of NATHAN ROTHSCCHILD for making the necessary remittances to the British army in that country were first brought into full play. He had come to England in 1800, and had acted as his father's agent in the purchase of Manchester goods for the Continent, and shortly afterwards through his father he had large sums entrusted to him for the Elector of Hesse Cassel and for other German princes, and these he employed with such great judgment that his means began rapidly to increase. His financial transactions pervaded the whole Continent, and he came to be consulted upon almost every speculation and undertaking. His brothers looked to his judgment on all matters of a pecuniary character. He may be said to have been the first introducer of foreign loans into this country; for though such securities had been dealt in before, yet the dividends being payable abroad, and subject to a constant fluctuation in the rate of exchange, had made them too inconvenient an investment for the multitude. It is said that such was Mr. Rothschild's judgment and good management that not one of those with whom he entered into contracts ever failed in their engagements. His loan contracts however were not always successful in the first instance; for example, he is said to have lost 500,000*l.* by Lord Bexley's loan or funding of Exchequer Bills; the vast resources at his command however enabled him to bear these and all other losses, which would have sunk a house of less gigantic means. To such a height however did he carry his reputation for loan operations that it became almost a matter of rivalry between different states which should obtain his co-operation. He always avoided entering into any money contracts with Spain or the Spanish settlements in America; he also refused to connect himself with the various Joint-stock Companies of the day, with the single exception of the Alliance Insurance Company, in the formation of which he took a leading part. He was distinguished alike by his accuracy and correctness in matters of business and his liberality of dealing with all who were brought into the sphere of his monetary negotiations, and by his private and personal charities, which he distributed on a large scale, more especially among the poor of his own religion. He received letters patent of denization in England in 1804, and in 1822 was advanced by letters Imperial, dated Vienna, September 29, 1822, to the dignity of a Baron of the Austrian Empire. This title however he never assumed, and was justly more proud of his high commercial and untitled name. He died at Frankfurt, July 28, 1836, leaving by his wife, the daughter of Mr. Levi Cohen, a London merchant, three daughters and four sons. Of the former, two are married to their cousins, and the third to the Right Honourable Henry Fitz Roy, M.P. His eldest son, the Baron Lionel Nathan de Rothschild, has been elected on four different occasions to represent the city of London, but has never taken his seat in the House of Commons, because as a Jew he cannot conscientiously take the oaths 'on the true faith of a Christian.' His second son, Anthony, was created a Baronet in 1846.

ROTTECK, KARL WENCESLAUS RODECKER VON, was born on the 18th of June, 1775, at Freiburg-im-Breisgau, which now belongs to the Grand Duchy of Baden, but at that time was subject to the House of Austria. His father, Anton Rodecker, was ennobled by the Emperor Joseph II. under the name Rodecker von Rotteck, on account of the eminent services which he had done to his country and the emperor as perpetual dean of the Medical Faculty in the University of Freiburg, and as one of the councillors in the board of administration of Austrian Suabia. His mother, Charlotte Poirot d'Ogeron, a native of Remiremont in Lorraine, is described as a lady of rare virtue and attainments. Karl von Rotteck received a very careful education, and as early as 1790 was admitted a student in the faculty of law in the university of his native town. He took the degree of Doctor of Civil Law in 1797, yet he always preferred history to law, and in 1798 was appointed professor of history at Freiburg.

Although he did not appear as a writer before 1811, except as the author of a few minor productions, he nevertheless devoted all his

spare time towards the accomplishment of a great historical work, which secured him a high rank among the historians of Europe. Of his 'Allgemeine Weltgeschichte,' ('Universal History,') the first volume was published in 1811, but it was only finished in 1827. Germany having recovered its independence through the treaties of 1814 and 1815, and political liberty having been promised to the inhabitants, Rotteck made the constitutional law of Germany an object of his particular attention; and desiring to propagate his ideas, gave up the chair of history, and petitioned for that of politics and the law of nations in the same university, which he obtained in 1818. On those subjects he published a great number of works and memoirs as well as articles in the leading liberal periodicals in Germany, and the princes of Germany being then active in checking the rising liberal spirit of the nation, he obtained great popularity. In 1819 he was chosen by his university as their representative in the first chamber of the States of Baden. In the same year appeared his 'Ideen über Landstände,' ('Ideas on Representative Bodies,') a work distinguished by great historical learning, liberal views, and that lucid and attractive style for which he is remarkable among the German historians and publicists. Some time afterwards he wrote a work on standing armies, the danger of which he endeavoured to show, and a history of the transactions of the States of Baden, which were well received by the people, but made him many enemies among the friends of the old state of things.

Thus, lecturing in the university, propagating his liberal views through countless minor productions, and representing Freiburg in the states, he continued till 1830. The outbreak of the French revolution in 1830 gave fresh vigour to his activity; he became the leading spirit of the best among the liberal periodicals of Germany, several of which were founded by him; and giving up his seat in the first chamber of the states as member for the university, he accepted the membership for the city of Freiburg, which placed him in the second chamber, among the representatives of the people. At the head of those members who by their unremitting zeal in developing political freedom in Baden set an example to all Germany, Rotteck was exposed to slander, and at last violent attacks. As soon as the fear of France had subsided, the German government took courage to punish those who had given offence. In consequence of a decree of the Diet in 1832, the Baden government forbade Rotteck to lecture in the University of Freiburg, and he was declared to have forfeited, for five years, the right of editing any newspaper. Germany now looked upon him as a political martyr, and from its most distant provinces he received addresses and presents. His native city elected him mayor, but the government refused to give their sanction: they likewise tried to exclude him from the second chamber of the states, and to prevent his re-election; but there they failed, and from 1830 to 1840 he continued to represent Freiburg without any interruption. In 1840 the Baden government re-admitted him as a lecturer at Freiburg, but it was too late: after a severe illness, rendered worse by the moral sufferings he had been exposed to, Rotteck died on the 20th of November, 1840. His death was mourned as a public calamity in all Germany.

The principal work of Rotteck is his 'Allgemeine Weltgeschichte' mentioned above, which extends from the commencement of authentic history to 1815. It met with such success that a fifteenth edition was called for, and published in 1841-45, in 11 vols. 8vo., with a continuation to 1840, by K. H. Hermes, Brunswick. Of these eleven volumes, nine are the work of Rotteck, and the two last the continuation of Hermes. No general history ever enjoyed such popularity as this splendid production of Rotteck; in Germany it is in the hands of almost every educated family; its fame soon spread over Europe and America; and it was consequently translated into most of the European languages. The English translation by T. Jones, Philadelphia, four vols. 8vo, 1840-42, 2nd edition, London, 1842, is however only a translation of an extract of the 'General History,' which Rotteck published under the title 'Auszug aus der Weltgeschichte,' Freiburg, 1831, &c. 4 vols. 8vo. Contrary to the practice of most German historians, Rotteck simply relates history, indulging neither in critical investigation of trifles, nor in metaphysical contemplation of the broad facts of human deeds. But the whole is represented from a liberal point of view, and enlivened by sound reflections on the origin of freedom and slavery, and the causes of the rise and fall of nations. The style of Rotteck is clear and attractive, but sometimes a little rhetorical; the logical order is never interrupted; and every page shows that the author possessed that rare taste and that discretion which enable a man to distinguish between trifles and important facts, and to give neither too much nor too little. The reader who wishes to obtain a strong impression of the peculiar merit of this work, as the production of a German historian, need only compare it with Hammer's far-famed History of the Turkish Empire. Among the other works of Rotteck we mention 'Kleinere Schriften' ('Minor Works'), 5 vols. 8vo, 1829-35, which contain a great number of valuable memoirs, essays, letters, &c., on various, mostly historical subjects; 'Lehrbuch des Vernunftrechts und der Staatswissenschaften' ('Doctrine of Law as a Metaphysical Science, and of Public and Constitutional Law'), 4 vols. 8vo, 1829, &c.; 'Staatsrecht der Constitutionellen Monarchie' ('The Public Law of Constitutional Monarchies'), 3 vols. 8vo, 1824, &c. Rotteck was the co-editor, with Welcker, of the excellent 'Staats Lexicon,' &c. ('Political Dictionary'). Dr. Hermann Rotteck, the son of the historian, published 'Rotteck's Nachgelassene Schriften'

('Posthumous Works'), Freiburg, 5 vols. 8vo, 1841-43, which contain also most of the 'Minor Works' mentioned above.

(The Life of Rotteck by his Son, in the fourth volume of *Nachgelassene Schriften*; Rotteck's *Ehrentempel*, Freiburg, 1842; *Conversations-Lexicon Supplement*.)

ROTTENHAMER, or ROTHENAMER, JOHANN, was born at Munich in 1464, and received instruction in the rudiments of painting from an obscure artist named Donhauser or Donower. Early in life he went to Rome, and became known for small historical compositions painted on copper in a style of most minute finishing. Emboldened by success, he undertook to paint for one of the churches of Rome a large altar-piece, representing several saints and a glory of angels, a work which, when completed, excited astonishment at the extent and versatility of his talents. This work he afterwards repeated for the church of Santa Croce at Mantua. He visited Venice, and studied the colouring of Tintoretto, whose style he imitated with great exactness. Whilst at Venice, he painted some pictures for the public edifices, two of which are mentioned by Lanzi, namely, a Santa Cristina at the Incurabili, and an Annunciation at San Bartolommeo; but that writer speaks in slighting terms of these works, and generally so of the talent of the painter. During his stay in Italy, which lasted several years, he was patronised by Ferdinand, duke of Milan, for whom he painted, amongst numerous works, a picture of Nymphs dancing, which was much admired.

He returned to his native country, and established himself at Augsburg, where he was much employed. For the emperor Rudolph II. he painted a fine picture of the Feast of the Gods, a composition of many figures, gracefully designed, and coloured with the splendour of the Venetian school. Many of his backgrounds were painted by John Breughel, and some by Paul Bril. He was partial to the introduction of gaudy accessories into his pictures, which he frequently enlivened by naked figures designed with taste and coloured with delicacy. His heads are expressive, but present too much sameness of appearance, and his design, though tolerably correct, is generally formal and mannered. Though greatly employed, Rottenhamer died in poverty, and was buried by subscription at Augsburg, where (and not in England, as Lanzi says) he died in 1604.

ROUBILIAC, LOUIS FRANÇOIS, an eminent sculptor, was born about 1695, at Lyon in France, but long resident in England, where all the works by which he gained his reputation were executed. It is not known exactly at what period Roubiliac came to this country, though Cunningham is probably not far wrong in fixing the date in 1720. The earliest notice of him as an artist is the statement of Lord Orford, that he was recommended by Sir Edward Walpole to execute several busts for Trinity College, Dublin, but he does not mention the year when this happened. He was afterwards employed, through the same interest, on the monument of John, duke of Argyle, in which he was so successful, that his claims to the highest honours of his profession were at once admitted, and, as he became the fashion, his practice was soon greater than that of the most popular artists of the day. Rysbrach, who also was settled in England, and who, till Roubiliac and Scheemacker appeared, was employed in all important works in sculpture, was neglected, and his merits forgotten in the desire to do honour to the new favourite. Roubiliac's chief works are the above-mentioned monument of the Duke of Argyle, those of Sir Peter Warren, of Marshal Wade, and of the Nightingale family, all in Westminster Abbey; those of the Duke and Duchess of Montague, in Northamptonshire; and one in memory of Bishop Hough, in Worcester Cathedral. His principal statues are of George I., at Cambridge; of George II., in Golden-square, London; of Shakspeare, executed for Garrick, and bequeathed by him to the British Museum, where it now is; of Handel, the composer, in Westminster Abbey; and those of the Duke of Somerset and Sir Isaac Newton, both at Cambridge. His busts are very numerous: it is only necessary to mention the celebrated series of busts of eminent men in Trinity College, Cambridge, which amply establishes his high rank in that branch of the art.

Of the high merit of Roubiliac there can be no doubt. The monuments of Mr. Nightingale and his lady, the statue of Eloquence in the Argyle monument, the draped figure in Bishop Hough's monument, and the statue of Newton, are proofs of power both in invention and expression, and are remarkable also for minute and careful execution. At the same time they are deficient in the repose, simplicity, unity, and breadth which ought to characterise works in sculpture, and which alone can ensure the lasting reputation of productions in this art when the interest that may have been felt in the individual subjects, the fashion of the day, and the popularity of the artist, have passed away. In the absence of these principles we find sufficient reason for the (comparatively) low estimation in which the sculpture of Roubiliac is now held by all real judges of art.

The most striking defect in the Nightingale monument (to illustrate criticism by reference to a well-known work), is, that the limits which separate poetry and imitative art are transgressed, and the result is confusion and incongruity. The sentiment of a husband endeavouring to shield a beloved wife from the approach of death is just; it appeals to our sympathies, and the mind at once comprehends it; but the attempt to give form to this idea by representing a common-place figure, in modern dress, warding off a palpable and material dart about to be hurled by a grim skeleton—making that an agent

which is the result or consequence of dissolution—is so obviously wanting in truth or keeping, that it is only necessary to refer to it to show its impropriety. The statue of Newton, though possessing great merits, is open to objections of another kind. The attitude is intended to express thought and calculation, and the action of the hands is finely conceived and in harmony with this feeling; but the impression is weakened by the general air of the figure, which, critics have justly observed, is not that of a grave philosopher; and the drapery, though executed with great mechanical skill, and with minute attention to correctness of costume, is equally wanting in the repose appropriate to the subject. The sacrifice of simplicity to attitude and flutter, and the ambition to display skill in mere execution—the sure indication of the decline of pure taste—also detract from the general merits of the statues referred to in the monuments of the Duke of Argyle and Bishop Hough. Roubiliac's faults are however the faults of the age; and artists unfortunately are too often tempted or driven, against their better judgment, to adopt the mode, however opposed to pure taste or sound principles, by which alone they can expect to gain public notice. Roubiliac died on the 11th of January 1762, and was buried in the parish of St. Martin's.

ROUSSEAU, JEAN BAPTISTE, was born in Paris, on the 6th of April 1670. His father, who was a shoemaker, furnished him with a liberal education. In 1688 he attended the French ambassador to the court of Denmark, and afterwards came to England with Marshal Tallard. On his return to Paris he devoted himself to poetry. His first productions consisted chiefly of satirical epigrams, most of which were pointed against contemporary writers. He thus created a number of enemies, and laid the foundation of that spirit of persecution which afterwards drove him from his native land. In 1694 his first comedy, 'Le Café,' was performed, with little success. This was followed in 1696 by the opera of 'Jason, ou la Toison d'Or,' and in 1697 by that of 'Venus and Adonis,' both of which were even more unsuccessful than his first comedy. His next dramatic effort was the comedy of 'Le Flatteur,' which was brought out at the Théâtre Français, and was received with considerable applause, but did not command more than ten representations. It was then in prose, but he afterwards put it into verse. He finished his dramatic career about four years afterwards with the comedy of 'Le Capricieux,' which met with an unequivocal condemnation, while Danchet's opera of 'Hesione,' which was brought out at the same time, was brilliantly successful. For some time previous to this, the Café Laurent, in the Rue Dauphine, had been and still continued to be frequented by La Motte, Saurin (Joseph), T. Corneille, Crebino, Boinadin, Rousseau, and other literary men; and Rousseau, who seems to have thought that a cabal had been formed among them to ruin his piece and exalt the other, gave vent to his disappointed feelings in a satirical parody of some couplets of the prologue to 'Hesione.' The parody consisted of five couplets, confessedly by Rousseau, but they were followed by others still more calumnious, which were aimed at the frequenters of the Café Laurent, and these were also attributed to him by La Motte, Saurin, and others, who belonged to an opposite literary party. To this charge he made no other reply than that of stating to his friends that they were not written by him, but withdrew himself from the meetings at the café; and there, for the present, the matter ended.

In 1703 we find Rousseau living in Paris with M. Rouille, director of the finances, by whom he was taken to court, and introduced to the first society. About this time he began to write his 'Sacred Odes,' in accordance with the solemn piety, real or affected, which Louis XIV. had rendered fashionable at his court during the latter years of his reign. He is charged with composing licentious epigrams at the same time, to suit the taste of another class of his acquaintance. In 1710 the place left vacant by T. Corneille in the Académie Française was contended for by La Motte and Rousseau, and obtained by the former. The approaching death of Boileau however was expected soon to occasion another vacancy, and also to leave at the disposal of the court the pension which he had enjoyed, and which could only be bestowed upon an academician. Rousseau expected to fill the vacancy, and also aspired to the pension; La Motte however prepared to contend with him for the latter. Such was the state of the two literary parties which then divided Paris—La Motte and Saurin being leaders of the one, and Rousseau of the other, when a new series of couplets made their appearance, more calumnious and indecent than the former, in which the frequenters of the Café Laurent, and especially La Motte, were attacked. These couplets were immediately attributed to Rousseau by his enemies; but he indignantly disavowed them, and having discovered the man who dropped them about the streets, and drawn from him a confession that they were given to him by Saurin, he charged that gentleman before a court of law with having written them, but failed in establishing his charge by legal proof. Finding that he was now placed in a dangerous situation, he withdrew to Switzerland, and on the 7th of April 1712 an arrêt of parliament, given 'par contumace,' condemned him to perpetual banishment from France. Rousseau denied to the last that he had anything to do with these couplets; and Boinadin, to whom they were addressed, and who was much abused in them, always refused to believe that they were Rousseau's, and left a memoir, which was published after his death (12mo, Brussels, 1752), in which he accuses Saurin, La Motte, and a jeweller of Paris, of being the authors of them.

From this time Rousseau's life was passed in various countries of Europe. The Comte de Luc, the French ambassador to Switzerland, received him under his protection, and admitted him to an intimacy which was only terminated by the death of that nobleman in 1740. Rousseau accompanied De Luc to Baden in 1714, where he became known to Prince Eugene, who also took him under his patronage; and in 1715, when the Comte was appointed ambassador to Vienna, Rousseau went with him to that city, where he remained three years.

Rousseau had left powerful friends in Paris, among whom the Baron de Breteuil exerted himself with so much success as to obtain for him letters of recall, which were forwarded to him in February 1716; but Rousseau refused to avail himself of them, on the ground that they were granted to him as an act of grace, whereas he required a public acknowledgment of the injustice of his sentence. In 1720 he went to Brussels, where he became acquainted with Voltaire, and they were friendly for some time, but afterwards became bitter enemies. In 1721 he came to England, where he published a new edition of his works (1723, 2 vols. 4to), which produced him about 2000*l*. This sum he unfortunately invested with the Ostend Company, which failed, and he again became dependent on his friends for support. He now returned to Brussels, and was received under the protection of the Duke d'Arenberg, who, when he quitted Brussels in 1733, settled a pension upon him. In 1738 Rousseau became desirous of returning to France, and made interest to procure the same letters of recall which, more than twenty years before, he had indignantly rejected, but he could not obtain them. He however ventured to visit Paris incognito; but though the authorities shut their eyes to this infraction of the law, they gave him no hope of being recalled. After remaining a few months in Paris, he returned to Brussels, where he died, March 17, 1741.

The first collected edition of his works was published by himself, after his banishment at Soleure, in Switzerland; the next was that of London, 2 vols. 4to, 1723, which was reprinted at Paris in 1743, and was again reprinted at Paris in 1757, with a fifth volume, containing the licentious epigrams, many of which were no doubt properly ascribed to him, and also of the notorious couplets, engraved in imitation of the hand in which they were written. The most complete edition of his works (not including the licentious epigrams) was published at Brussels in 1743, under the superintendence of M. Seguy, 3 vols. large 4to, with the author's last corrections. It consists of his poems, his dramatic pieces, and a collection of his letters. There is a beautiful edition of his works, 5 vols. 8vo, Paris, Lefèvre, 1820. There are several other editions.

Jean Baptiste Rousseau stands indisputably at the head of the lyric poets of France. His poems consist of—'Odes Sacrées,' 1 book; 'Odes,' 3 books; 'Cantates,' 1 book; 'Épîtres,' 2 books; 'Allégories,' 2 books; 'Épigrammes,' 3 books; and 'Poésies Diverses,' 1 book. Rousseau's dramatic pieces, as may be inferred from the manner in which they were received by the public, are of little value. His epistles, allegories, and miscellaneous poems are perhaps not much inferior to Boileau in strong sense and elegance of versification, but are inferior to him in wit. His epigrams are neat and sparkling, and the satire is directed to its mark with an aim that seldom fails. His fame however rests upon his odes and his cantatas. His sacred odes are free imitations of the Psalms of David, not so close as translation nor so wide as paraphrase. Too many of his other odes are addressed to kings, ministers, and generals, and relate to events of temporary interest. His best odes however are distinguished by boldness and justness of thought; by simplicity of expression, by fullness and distinctness of imagery, without being overloaded with it; by an earnestness and enthusiasm which seem to spring spontaneously from the feelings of the poet; and by a splendour and harmonious richness of diction in which he seems to have no rival among French poets. His cantatas are a species of ode of which part is adapted for recitation and part for singing. They are beautiful compositions. Some of them may be said to approach the sublime, if they do not reach it; and others, which are of a lighter character, are exceedingly graceful.

ROUSSEAU, JEAN JACQUES, was born at Geneva in 1712, and was the son of a watchmaker. While yet a child he lost his mother, and his father having married again, young Rousseau was removed from his paternal roof, and after remaining for some time at a village school in the neighbourhood of Geneva, was apprenticed to an engraver, a coarse man, whose brutal treatment tended to sour a temper naturally irritable and morose. The boy became addicted to idle habits, and to lying and pilfering. At last, through fear of punishment for some misconduct, he ran away from his master, and wandered into Savoy, where, finding himself destitute, he applied to the bishop of Annecy, on the plea of wishing to become a convert to Roman Catholicism. The bishop recommended him to Madame de Warens, a Swiss lady, who, being herself a convert to Catholicism, had settled at Annecy. Through her kind assistance he obtained the means of proceeding to Turin, where he entered the college of the Catechumens, and after going through a preparatory course of religious instruction, he abjured the Reformed religion and became a Roman Catholic. But as he refused to take orders, he was dismissed from the establishment, and left to his own resources. Accordingly he became a domestic servant, but his want of discretion and self-control rendering him unfit for his situation, he left Turin and recrossed the Alps. He

found Madame de Warens residing at a country-house near Chambéry, who received him kindly, and afforded him support and protection in her own house during the next ten years. Of his foolish, profligate, and ungrateful conduct during a great part of this period he has given an account in his 'Confessions.' After many absences and many returns, he quitted her finally in 1740, with letters of introduction for some persons at Lyon. He acted in succession as preceptor, musician, and private secretary to the French envoy to Venice, whom he followed to that city. From Venice he proceeded to Paris, in 1745. On alighting at an inn, he became acquainted with a servant girl, Therese Levasseur, with whom he formed a connection which lasted for the rest of his life. He attempted to compose music for the stage, but he did not succeed in selling it. His next employment was as a clerk in the office of M. Dupin, fermier-général, where however he did not remain long. In 1748 he became acquainted with Madame d'Epainay, who proved one of his steadiest and truest friends. At her house he formed the acquaintance of D'Alembert, Diderot, and Condillac, and by them he was engaged to write articles for the 'Encyclopédie.'

One day he read in an advertisement that a prize was offered by the Academy of Dijon for the best essay on the question—'Whether the progress of science and of the arts has been favourable to the morals of mankind?' Rousseau determined to support the negative, and Diderot encouraged, but did not originate, his determination. He supported his position in a style of impassioned eloquence, and obtained the prize. His success confirmed him in his bias for paradox and exaggeration, and henceforth he seemed to have adopted as a general principle that the extreme opposite to wrong must of necessity be right. His opera, 'Le Devin du Village,' was played before Louis XV., at the Court Theatre of Fontainebleau. Rousseau was in one of the boxes with a gentleman of the court. The king, being pleased with the opera, expressed a desire to see the author, which being signified to Rousseau, his shyness took alarm, and he actually ran away out of the house, and did not stop till he reached Paris. He had neither easy manners nor facility of address, and his own acute feeling of these deficiencies tormented him throughout life, and tended to perpetuate and increase his natural awkwardness. In order to hide these imperfections, he affected disregard of manners, and put on the appearance of a misanthropist, which he in reality was not. He lived chiefly by copying music, and several persons who knew his straitened circumstances sent him work, for which they offered him three or four times the usual remuneration, but he never would accept anything beyond the accustomed price.

In 1753 he wrote his 'Lettre sur la Musique Française,' which sorely wounded the national vanity. His next publication, a letter to D'Alembert, 'Sur les Spectacles,' gave rise to a controversy between them. He wrote also a 'Discours sur l'Origine de l'Inégalité parmi les Hommes,' which was admired for its eloquence; but his usual paradoxical vein runs through the whole composition. Rousseau asserts that man is not intended for a social state; that he has a bias for a solitary existence, and that the condition of the savage in his native wilds is a true state of freedom, and the natural state of man, and that every system of society is an infraction of man's rights. He also maintains that all men are born equal, in spite of the daily evidence which we have of the inequalities, physical and moral, observable even in childhood. This idea of the equal rights of men, derived not from reason or religion, but from his favourite theory of man's equality in a state of nature, Rousseau afterwards developed more fully in his 'Contrat Social,' a work which, after leading astray a number of people, and causing considerable mischief, is now regarded by all sound thinkers as a superficial essay. It is a curious fact that Rousseau, after reading the works of Bernardin de St. Pierre, had observed that in all the projects of society and government of that writer there was the fundamental error of "supposing that men in general and in all cases will conduct themselves according to the dictates of reason and justice, rather than according to the impulse of their own passions or wayward judgment."

In 1756 Rousseau, at the invitation of Madame d'Epainay, took up his residence at her country-house, called L'Hermitage, in the pretty valley of Montmorency, near Paris. Here he began to write his celebrated novel, 'Julie, ou la Nouvelle Héloïse,' which he finished in 1759. It is of little value as a work of imagination or invention, but as a specimen of impassioned eloquence it will always be admired. Rousseau while he wrote it was under the influence of a violent attachment for Madame d'Houdetot, sister-in-law of Madame d'Epainay; and this passion, absurd and hopeless though it was, served to inspire him during the progress of his work.

'La Nouvelle Héloïse' has been censured as tending to render vice an object of interest and sympathy. The character of the hero is culpable, for he forgets the obligations of hospitality, and betrays the confidence reposed in him. But here we again perceive the influence of Rousseau's favourite paradox; for, in a state of nature, such as Rousseau fancied it, the relative position of St. Preux, his pupil, and her parents, would not have been the same as in the novel, for they would have all been savages together, and the intimacy of St. Preux with Julie would have been a matter of course. Rousseau however, by the character which he has drawn of Julie after she becomes a wife, has paid a just homage to the sacredness of the marriage bond, and to

the importance of conjugal duties, which constitute the foundation of all society. Rousseau admired virtue and felt its value, though he did not always follow its rules. He says of himself, that after much reflection, perceiving nothing but error among philosophers, and oppression and misery in the social state, he fancied, in the delusion of his pride, that he was born to dissipate all prejudices; but then he saw that, in order to have his advice listened to, his conduct ought to correspond to his principles. It was probably in compliance with this growing sense of moral duty that at last he married the woman whom he had so long been living with, who had then attained the age of forty-seven, and who, as he himself says, did not possess either mental or personal attractions, and had nothing to recommend her except her attention to him, especially in his fits of illness or despondency. He also repented in the latter years of his life of having sent his illegitimate children to the foundling hospital.

Rousseau's 'Emile,' which appeared in 1762, contained a new system of education. He gives many good precepts, especially in the first part of the book, which was productive of a beneficial change in the early treatment of children in France: it induced mothers of the higher orders to nurse their children themselves; it caused the discontinuance of the absurd practice of swaddling infants like mummies; it taught parents to appeal to the feelings of children, and to develop their rational faculties rather than frighten them into submission by blows or threats, or terrify them by absurd stories. In these respects Rousseau was a benefactor to children; but as he proceeded in his plan for older boys he became involved in speculations about religion and morality, which gave offence both to Roman Catholics and Protestants. The parliament of Paris condemned the book. The archbishop issued a 'mandement' against it. The States-General of Holland proscribed it, and the council of Geneva had it burnt by the hand of the executioner. The publication of his 'Contrat Social,' which took place soon after, added to the outcry against him, in consequence of which Rousseau left Paris and repaired first to Yverdon, but the senate of Bern ordered him to quit the territory of the republic. He then went to Neuchâtel, of which Marshal Keith was governor for the King of Prussia. Keith received him kindly, and Rousseau took up his residence at Motiers in the Val de Travers, whence he wrote a reply to the Archbishop of Paris, and a letter to the magistrates of Geneva, in which he renounced his citizenship. In his retirement he wrote the 'Lettres écrites de la Montagne,' being a series of strictures on the political and ecclesiastical government of Geneva as it then was. This work increased the irritation against the author, a feeling which spread even among the villagers of Motiers, who annoyed their eccentric visitor in various ways, which however the suspicious temper of Rousseau probably exaggerated. He removed to the little island of St. Pierre in the Lake of Bienne, where he assumed, no one knows why, the Armenian costume. Being sent away thence by an order from the senate of Bern, he accepted the kind invitation of David Hume, who offered him a quiet asylum in England. Rousseau arrived in London in January 1766, and the following March went to Wootton in Derbyshire, where Hume had procured him a private residence in the house of Mr. Davenport. It was not long however before Rousseau quarrelled both with Hume and Davenport, and suddenly returned to France. A letter had appeared in the newspapers bearing the name of Frederick of Prussia, and reflecting severely upon Rousseau's moral infirmities. Rousseau accused Hume of being the author or planner of the pretended communication. In vain did Hume protest that he knew nothing of the matter. At last Horace Walpole acknowledged himself the author of the offensive letter. Rousseau however would not be pacified, and he continued to charge Hume with the blackest designs against him.

After his return to France, Rousseau led an unsettled life, often changing his place of residence, till 1770. He published in the meantime a 'Dictionnaire de Musique,' which was considered to be both imperfect and obscure. He then returned to Paris, and took lodgings in the Rue Plâtrière, which has since been called Rue J. J. Rousseau. He was left undisturbed by the authorities, but he was cautioned, as there was still a prosecution pending against him on account of his 'Emile,' not to make himself conspicuous in public; an advice which seemed to produce the contrary effect upon his wayward temper. He now fell into a real or affected state of misanthropy, fancying that everybody was conspiring against him, and he complained at the same time of acute mental suffering. Byron, who in his mental bias had some points of resemblance with Rousseau, has strikingly described him:—

"His life was one long war with self-sought foes,  
Or friends by himself banished; for his mind  
Had grown suspicion's sanctuary, and chose  
For its own cruel sacrifice, the kind,  
'Gainst whom he raged with fury strange and blind.  
But he was phrenzied—wherefore, who may know?  
Since cause might be which skill could never find;  
But he was phrenzied by disease or woe,  
To that worst pitch of all which wears a reasoning show.

"For then he was inspired, and from him came,  
As from the Pythian mystic cave of yore,  
Those oracles which set the world in flame,  
Nor ceased to burn till kingdoms were no more."

('Childe Harold,' canto iii.)

One of Rousseau's grievances was that he thought the French ministers had imposed restrictions upon his writing. One of his friends applied to the Duke of Choiseul on the subject. The duke's answer, dated 1772, is as follows:—"If ever I have advised M. Rousseau not to publish anything without my previous knowledge, of which fact I have no remembrance, it could only have been with a view to save him from fresh squabbles and annoyances. As now however I have no longer the power of protecting him [the duke had just resigned his premiership], I fully acquit him of any engagement of the sort."

As Rousseau grew old and infirm, the labour of copying music became too irksome, and all his income consisted of an annuity of 1450 livres, not quite 60*l.* sterling. His wife was also in bad health, and provisions were very dear, and he found that he could not remain in Paris. The Marquis de Girardin, being informed of this, kindly offered Rousseau a permanent habitation at the château of Ermenonville, near Chantilly. Rousseau accepted for his residence a detached cottage near the family mansion, whither he removed in May 1778. In this new abode he appeared for once contented. He used to botanise in the neighbourhood with one of the sons of the marquis. On the 1st of July he went out as usual for the purpose, but returned home fatigued and ill. The next morning after breakfast he went to his room to dress, as he intended to pay a visit to Madame de Girardin; but he felt exhausted, and his wife coming in gave the alarm. Madame de Girardin came at once to see him; but Rousseau, whilst thanking her for all her kindness, begged of her to return to her house, and leave him for the present. Having requested his wife to sit by him, he begged her forgiveness for any pain that he might have caused her, and said that he died in peace with all the world, and that he trusted in the mercy of God. He asked her to open the window, that he might once more behold the lovely verdure of the fields. "How pure and beautiful is the sky," observed he; "there is not a cloud on it. I hope the Almighty will receive me there." So saying, he fell with his face to the ground; and when he was raised, life was extinct. His death was purely natural, and not in consequence of suicide, as was said by some. He was buried, according to his request, in an island shaded by poplars, in the little lake of the park of Ermenonville, and a plain marble monument was raised to his memory.

He had begun to write his autobiography when he was in England, under the title of his 'Confessions.' This work contains many exceptional passages. It ought to be observed however that he did not intend it for publication until the year 1800, judging that the persons mentioned in it would then be dead; but through an abuse of confidence on the part of the depositaries of his manuscript, it was published in 1788. Rousseau did not, like Voltaire, sneer at religion and morality. He was sceptical, but had no fanatical hatred of Christianity; on the contrary, he admired and praised the morality of the Gospel. "I acknowledge," he says in the 'Emile,' "that the majesty of the Scriptures astonishes me, that the holiness of the Gospel speaks to my heart. Look at the books of the philosophers; with all their pomp, how little they appear by the side of that one book! Can a book so simple and yet so sublime be the work of men? How prejudiced, how blind that man must be, who can compare the son of Sophroniscus (Socrates) with the son of Mary!" With such sentiments Rousseau could not long agree with Diderot, Helvetius, D'Holbach, and their coterie. They ridiculed him as a bigot. Voltaire, on his part, coarsely abused him on many occasions, it is believed from literary jealousy; but Rousseau never retorted. "I have spent my life," says Rousseau, "amongst infidels, without being seduced by them: I esteemed and loved several of them personally, and yet their doctrines were insufferable to me. I told them repeatedly that I could not believe them. . . . I leave to my friends the task of constructing the world by chance. I find in the very architects of this new-fangled world, in spite of themselves and their arguments, a fresh proof of a God, Creator of all."

Through his deficient education, and his infirmities of judgment and temper, Rousseau was totally unfit to be a political writer. He set a pernicious example to many others, who were still less qualified by proper study to consider themselves as legislators and reformers. Rousseau by his eloquence misled the understanding; Voltaire by his sneers and ribaldry destroyed all moral feeling. Both writers exerted a great influence on the generation which they saw grow up, and which afterwards effected the great French revolution; and yet Rousseau might well disclaim all intention to contribute to such a catastrophe. While Helvetius maintained the principle that "any action becomes lawful and virtuous in the furtherance of the public weal," Rousseau says that "the public weal is nothing unless all the individuals of society are safe and protected." And elsewhere he says that if the attainment of liberty should cost the life of a single man, it would be too dearly bought. He also said, speaking of his 'Contrat Social,' that it was not written for men, but for angels. M. Angar one day introduced his son to Rousseau, saying that he had been educated according to the principles of the 'Emile;' when Rousseau gruffly replied, "So much the worse for you and for your son too!" All these circumstances serve to show the real character of Rousseau's mind.

Rousseau set to music about one hundred French 'Romances,' some of them very pretty, which he published under the title of 'Consolations des Misères de ma Vie.' He was passionately fond of music,

though he seems not to have attained a profound knowledge of the subject.

There have been several editions of Rousseau's works: those of Lefevre, 22 vols. 8vo, 1819-20, and of Lequien, 21 vols. 8vo, 1821-22, are considered the best.

The town of Geneva has raised a bronze statue to his memory in the little island where the Rhône issues from the lake, which is a favourite promenade of the citizens.

ROUTH, REV. MARTIN JOSEPH, D.D., was born September 15, 1755, at South Elmham, near Beccles, in Suffolk. His father was the Rev. Peter Routh, who was rector of South Elmham from 1753 to 1764, when he resigned it for Beccles. In 1774 he became master of Beccles grammar-school. Martin Joseph Routh, after having been educated under his father, matriculated as a battler at Queen's College, Oxford, May 31, 1770, but in July 1771 was elected a demy of the college of St. Mary Magdalen. Having taken his degree of B.A., he became a Fellow in July 1776, and on the 23rd of October, in the same year, took his degree of M.A. In 1781 he was appointed college librarian; in 1783 he was elected senior proctor of the university, and in 1784 junior dean of arts. He proceeded B.D. July 15, 1786, and in 1789 was appointed one of the college bursars. He was elected president of Magdalen College April 11, 1791, on the resignation of Dr. Horne, bishop of Norwich.

Dr. Routh's first literary publication was an edition of the Enthydemus and Gorgias of Plato, 'Platonis Enthydemus et Gorgias, recensuit, vertit, Notasque suas adiecit Martinus Josephus Routh, A.M., Collegii D. Mariæ Magd. Oxon. Socius,' 8vo, 1784.

Having taken his degree of D.D., Dr. Routh in 1810 became rector of Tylehurst, near Reading, in Berkshire, whither he used to retire occasionally for the benefit of his health, and to enjoy the vacation allowed him by the statutes of his college. In 1814 he published the first two volumes of his 'Reliquiæ Sacræ; sive Auctorum jam Perditorum Secundi Tertique Seculi post Christum natum quæ supersunt,' 8vo. The third volume was published in 1815. In 1820 he married Eliza-Agnes, daughter of J. Blagrove, Esq., of Chalcot Park, near Tylehurst. In 1823 he edited Bishop Burnet's 'History of his Own Times.' In 1832 he published 'Scriptorum Ecclesiasticorum Opuscula,' 8vo, and a second edition in 1840. In 1833 he published an improved edition of Burnet's 'History of his Own Times.' In 1846 appeared four volumes of a new edition of the 'Reliquiæ Sacræ,' to which he added a fifth volume in 1848. He died December 22, 1854, at the age of ninety-nine, and was buried in the vault of the chapel of Magdalen College.

ROVERE, DELLA, the name of a noble family originally from Savona, in the territory of Genoa, which gave to the church two celebrated popes [SIXTUS IV. and JULIUS II.] besides many cardinals and other distinguished persons. Pope Julius II. caused his nephew Francesco Maria Della Rovere to be adopted by Guidobaldo of Montefeltro, duke of Urbino, who was childless, as his successor in the duchy. Accordingly, after the death of Guidobaldo in 1507, Francesco Maria took possession of Urbino. Under Leo X. he was driven away from his duchy to make room for Lorenzo de' Medici, a relative of the new pope. But after the death of Leo X., Francesco Maria was reinstated in the dominion of Urbino and Pesaro. He was much engaged in the Italian wars of that age, in which he acquired the reputation of an able commander. He died in 1538, and was succeeded by his son Guidobaldo, who was a patron of learning and of the arts. Guidobaldo died in 1574, and was succeeded by Francesco Maria II. This prince surpassed his predecessors as a patron of learning, and was himself learned in various branches of knowledge. Urbino continued to be under him, what it had been from the times of the Montefeltro family, a favourite resort of men of science and of literature. Francesco Maria II. by his liberality assisted the celebrated naturalist Aldrovandi of Bologna, in forming his rich museum of natural history. Duke Francesco Maria II. lost his only son Federico in 1623, and the court of Rome claimed the reversion of the duchy as a fief of the Papal see, Ferdinand II., grand-duke of Tuscany, who had married the Princess Vittoria della Rovere, daughter of the Duke of Urbino, was induced, chiefly through religious scruples, to give up his claims to the succession; and thus Tuscany lost the chance of extending its sway from sea to sea as far as the Adriatic. In 1632 Duke Francesco Maria died, when his dominions were seized by Pope Urban VIII. and annexed to the Papal territories.

ROWE, NICHOLAS, an English dramatic poet, was born at Little Beckford in Bedfordshire, in 1673. His father was John Rowe, of an old Devonshire family, and a serjeant-at-law of some eminence in his day. The son was educated at Westminster under Busby, and chosen one of the king's scholars. At the age of sixteen he was removed from school by his father, and entered as a student of the Middle Temple. He studied law for about three years, when, being left his own master by his father's death, he began to turn his attention to poetry, and withdrew himself from the less attractive reading of his profession. When he was twenty-five years of age he produced a tragedy, called 'The Ambitious Step-Mother,' which was very well received; and in 1702 appeared 'Tamerlane,' in which play, according to the taste of the time, Louis XIV. and William III. are represented respectively by Bajazet and Tamerlane.

This tragedy obtained great popularity, from its connection with the

politics of the day. In 1703 was published 'The Fair Penitent,' and in the interval between this date and his death he wrote 'Ulysses,' 'The Royal Convert,' a comedy called 'The Biter,' which proved a failure, 'Jane Shore,' written professedly in the style of Shakspeare, though with little of Shakspeare's manner, and lastly 'Lady Jane Grey.' In the meantime he had other avocations besides poetry: we find him in the office of under secretary for three years when the Duke of Newcastle was secretary of state, and after having been made poet-laureate at the accession of George I., he was appointed one of the land-surveyors of the customs of the port of London. He was also clerk of the council to the Prince of Wales, and was made secretary of the presentations by Lord Chancellor Parker, afterwards Lord Macclesfield. Rowe died December 6, 1718, aged forty-five, and was buried in Westminster Abbey. He was twice married, and had issue by both wives. Besides the plays enumerated, he wrote short poems, a translation of Lucan, and of Quillet's 'Calippadia.' He published an edition of Shakspeare, in which he has ventured on various restorations of his author's text. In the composition of his dramas, Rowe shows little depth or refined art in the portraying of character, but he writes with the easy grace of a well-educated man of fashion, undisturbed by the cares of needy authorship, or the ambition of writing himself into notice at the expense of good taste. His versification is harmonious, and the language of his characters natural in the dialogues. 'The Fair Penitent' contains several passages which are well wrought and show considerable powers of imagination. His translation of Lucan has been much praised by Johnson for preserving the spirit of the original, though upon comparison it will often be found feebly diffuse. His other poems are not of sufficient importance to require a separate notice.

ROWLEY, WILLIAM, an English dramatic writer, of whose life hardly anything is known. He flourished during the reign of James I., and belonged to the royal company of players, and as an actor excelled most in comedy. The "Maister Rowley, once a rare scholar of Pembroke Hall, in Cambridge," mentioned by Meres (2nd part of 'Wit's Commonwealth,' 1598) is probably some earlier author. Rowley wrote many plays, of which the following are the best known:—'A new Wonder, a Woman never vex't,' a comedy, 4to, 1532. A tragedy, called 'All's lost for Lust,' 4to, 1633. 'A Match at Midnight,' a comedy, 4to, 1633. 'A Shoemaker a Gentleman,' a comedy, 4to, 1638. 'The Witch of Edmonton,' a tragic-comedy (in this he was assisted by Thomas Decker, John Ford, &c.), 4to, 1658. 'The Birth of Merlin,' 4to, 1662. Shakspeare is said to have aided him in this play. The titles of others of his plays may be found in Watt's 'Bibliotheca Britannica,' and the 'Catalogue of the Library of the British Museum.' Rowley is a somewhat unpolished writer, hardly deserving a less obscure fate than he has met with. Several of Rowley's plays are printed in Dodsley's collection. He is the author of a rare tract, noticed with extracts in the 'British Bibliographer,' iv., entitled, 'A search for Money; or, the lamentable complaint for the losse of the wandering knight Monsieur l'Argent; or, Come along with me, I know thou lovest money: dedicated to all those that lack money, by William Rowley,' London, 4to, 1609; a composition full of the ribaldry and low wit of his time.

For notices of his life, see a copy of Langbaine's 'Dramatic Poets,' with manuscript notes, in the British Museum, and some statements in Collier's 'Dramatic History.' Two extracts from his plays are given in Lamb's 'Specimens of English Dramatic Poets.'

ROXANA was the daughter of Oxyartes, a Bactrian prince, who fell into the power of Alexander (B.C. 327), on his conquest of a strong natural fortress in Sogdiana, where Oxyartes had placed his wife and daughters. Roxana was pronounced by the followers of Alexander to be the handsomest woman they had seen in Asia after the wife of Darius, and her beauty made such an impression on Alexander, that he resolved to share his throne with her. Roxana, who was with child at the death of Alexander, subsequently bore a son, to whom the name of Alexander was given, and who was acknowledged as partner of Arrhidæus Philip in the empire. Statira, the other wife of Alexander, was also supposed to be pregnant; and accordingly, Roxana fearing lest Statira's child should become a rival of her own son, invited her and her sister Drypetis to Babylon, where they were put to death with the concurrence of Perdicas. Roxana and her son subsequently fell into the hands of Cassander, who kept them in close confinement in Macedonia. In the treaty of B.C. 311, made between the principal generals of Alexander, it was agreed that Cassander should continue military governor (σπάρτηγός) of Europe, till the son of Roxana came of age. Cassander however, to remove this obstacle to the throne, put to death the young king and his mother in the following year. (Diod. Sic., xxi. 105; Droysen, *Geschichte der Nachfolger Alexanders*.)

ROXBURGH, WILLIAM, M.D., a native of Scotland, who proceeded to India in the medical service of the East India Company, and distinguished himself by his attention to the botany of that country. In the early part of his career his attention was confined to the peninsula, as he was stationed at Samuleottah from the year 1781, where he paid particular attention to the cultivation of pepper. Into the plantations established for this purpose he introduced the coffee, cinnamon, nutmeg, annatto, bread-fruit tree, sappan-wood tree, and mulberry. He also endeavoured to introduce the culture of silk, as well as to

improve the manufacture of sugar, and was remarkable throughout for the great attention which he always paid to the improvement of the resources of the country. He knew and corresponded with Koenig, a pupil of Linnæus, who first gave an impulse to scientific botany in India. Dr. Roxburgh made large collections of plants in the Carnatic, but he had the misfortune to lose them all, with his books and papers, in an inundation at Injeram. He however recommenced making a fresh collection, and the Court of Directors sent him out a present of botanical books.

In the autumn of 1793, from his great merits, he was removed to Calcutta, where he was appointed superintendent of the botanic garden which had been established by Colonel Kyd. During his superintendence, which extended to 1814, few men have laboured with greater zeal, assiduity, and success, though he had very indifferent health; having been obliged to make three separate voyages for its re-establishment, once to the Cape and twice to Europe, on the latter of which occasions he died, in 1815. On one of these occasions, Dr. Carey, the celebrated missionary and Orientalist, took charge of the garden, and published, at Serampore, Dr. Roxburgh's catalogue of the contents of the botanic garden at Calcutta. From Dr. Carey's preface to this catalogue we learn that the number of described species then in the garden amounted to 3500, of which 1510 were named and described by Dr. Roxburgh, besides 453 which, though described, had not then been introduced. Besides describing, he had been in the habit of having splendid drawings made of the various plants that he discovered; these, to the amount of 2000, were sent to the Court of Directors. At their request, Sir Joseph Banks undertook the general superintendence of the publication of a work in which a preference was given to subjects connected with medicine, the arts, and manufactures, and which is now well known as Roxburgh's 'Coromandel Plants,' in 3 vols. folio, with 900 coloured engravings. Dr. Roxburgh's general descriptive work of the plants of India, called 'Flora Indica,' was not published for many years after his death. An edition was commenced, to be published at Serampore, by Dr. Carey, with additions by Dr. Wallich, the first volume in 1820, and the second in 1824. A complete edition, in 3 vols., was published by Dr. Roxburgh's sons in 1832.

ROY, MAJOR-GENERAL WILLIAM, R.A., F.R.S., F.S.A. the first British geodesist, with whom commences the history of the Ordnance trigonometrical survey of the United Kingdom, adorned by so many distinguished names that have already appeared in this work. The events connected with the suppression of the rebellion of 1745 having pointed out the propriety of exploring and mapping the wild Highland districts with a view to the establishment of military posts and roads of communication, a plan suggested by Lieutenant-General Watson, Deputy Quarter-Master General in North Britain, was undertaken in 1746 and 1747 by Colonel Roy, then Assistant Quarter-Master General; and the work was at length extended from the Highlands over the whole main land of Scotland. But this work, formerly known by the name of the Duke of Cumberland's map, was never published, and having been carried on with inferior instruments, was considered by Roy as merely "a magnificent military sketch." The war of 1755 put a stop to these works of peace; but at the peace of 1763 the subject of a general survey of Great Britain, which would have included the work already done in Scotland, again engaged the attention of the government, but was again thrown into shade by the American war. The peace of 1783 however permitted the reconsideration of the proposed survey; and at this critical period, a memoir by the French astronomer, M. Cassini de Thury, recommending the connection by trigonometrical measurements of the national observatories of Paris and Greenwich, and the consequent determination of the exact differences between their latitudes and longitudes, was submitted to the English government by the French ambassador. Cassini, Mechain, and Legendre had already carried a series of triangles from Paris to Calais, and it was only necessary that the English geodesists should complete the work by carrying a similar series from Greenwich to Dover. Mr. Fox by consent of the king (George III.) transmitted this memoir to the president of the Royal Society, Sir Joseph Banks, by whom the subject was brought before the council, and through whose influence General Roy was eventually appointed to conduct the operations. The site of the initial base of this work, which must be considered the germ of all subsequent and future scientific surveys of the United Kingdom, and which in fact was designed to be such by its projectors, in addition to the special object of the connection of the two observatories, was fixed at Hounslow Heath. After various experiments and preliminary trials, the base was ultimately measured by means of glass tubes, as suggested by Lieutenant-Colonel Calderwood, F.R.S., but General Roy made a direct comparison between them, and a steel chain constructed by Ramsden, by measuring the same 1000 feet with both, the result of which was very satisfactory. The length of the Hounslow base, as measured by him, when reduced to the level of the sea, was 27,404½ feet, or about 5½ miles. In 1785 General Roy received the Copley Medal from the Royal Society for this achievement. On the 31st of July 1787 the triangulation was commenced, by means of the great theodolite which had been constructed by Ramsden [RAMSDEN, JESSE] for the purpose. The measurement of a base of verification on Romney Marsh was entrusted by General Roy to Lieutenant Fiddes, R.E. and Lieutenant Bryce, R.A.

(afterwards Sir A. Bryce) and it was executed with the steel chain of Ramsden, as being better fitted for use on such ground than the glass tubes. The length of this base, after reduction, was found to be 23,532.92 feet, or rather less than  $5\frac{1}{2}$  miles, differing only a few inches from the length determined by triangulation from the Hounslow base, and therefore verifying the accuracy of the latter. The English triangulation was then connected with the French, by observations from both sides of the Channel, and thus were obtained the relative positions of the observatories. In addition to the great triangles, many secondary triangles were observed, which became a sure foundation for the topographical survey of Middlesex, Kent, and the adjoining counties.

In September 1783 General Roy completed this memorable work, involving the beginning of the measurement of the British arc of the meridian, and returned to London, but in very indifferent health. The increase of his illness compelled him to pass the winter of the following year at Lisbon; in April 1790 he returned to England, but he died on the 1st of July, at his house in Argyl-street, London; before the printing of his paper on the operations he had conducted, in the 'Philosophical Transactions,' had been completed, "though he lived sufficiently long," says Colonel Portlock (from whose sketch of the history of the survey the principal part of this article has been derived), "to correct all but the three last sheets of that most detailed and able account, both of the instruments he used and of the nature, objects, and result of the operations he so successfully carried out." At the period of his decease, General Roy was deputy quartermaster-general, colonel of the 30th regiment of infantry, and surveyor-general of the coasts. In 1821 and some of the following years, General Roy's work of the Hounslow base and subsequent operations was subjected to a much more severe and decisive test than had been afforded by the base of verification measured on Romney Marsh. The angles were re-measured by Colonel (afterwards Major-General) Colby [COLBY, THOMAS], and Captain Kater [KATER, HENRY], with the great theodolite by Ramsden, and the triangles were calculated with reference to the sphericity of the earth, which had not previously been taken into account. On comparing the results with those obtained by Roy, the greatest difference was found to be in the distance between the signal-stations at Dover and Calais, and this amounted only to 12 $\frac{1}{2}$  feet, the whole distance being 137,472 feet (see 'Phil. Trans.,' 1828). On the resumption of the survey, after the death of General Roy, the Hounslow base itself had been re-measured by Mudge [MUDGE, WILLIAM], and Dalby [DALBY, ISAAC], the result differing only by 2 $\frac{1}{2}$  inches from that originally obtained by the subject of this notice. The present astronomer-royal, Mr. Airy, has remarked on this commencement of the national survey and measurement of an arc of the meridian, "We believe it may fairly be said, that in this, as in other grand experiments, though we began later than our Continental neighbours, we conducted our operations with a degree of accuracy of which, till that time, no one had dared to form an idea." ('Fig. of the Earth,' in 'Ency. Metrop.,' vol. v. 1171.)

In 1777, as Colonel Roy, he communicated to the Royal Society, of which he had been elected a Fellow ten years previously, a paper, entitled 'Experiments and Observations made in Britain, in order to obtain a Rule for measuring Heights with the Barometer,' which was inserted in the 'Philosophical Transactions.' It is one of the most valuable contributions of the last century to the practical philosophy of the subject. But General Roy united to his purely scientific pursuits those of a geographical and historical antiquary, to which he had been led by his military studies. In 1774 he had a reduced copy of his survey of Scotland engraved for private circulation, with the title of 'Mappa Britannia Septentrionalis Faciei Romanae,' &c. He had given much attention during the survey to the Roman camps in Scotland, and at the period of his death he had completed an elaborate work on the subject, which, together with the illustrative drawings and the copper-plate of the map, was presented by his executors to the Society of Antiquaries of London, at whose expense it was published, in a folio volume of more than 200 closely-printed pages, with 51 plates, in 1793. The author's own title-page to this work, which is here transcribed, fully explains its object and nature:—"The Military Antiquities of the Romans in North Britain, and particularly their ancient system of Castrametation, illustrated from vestiges of the camps of Agricola existing there: hence his march from South into North Britain is in some degree traced. Comprehending also a Treatise, wherein the Ancient Geography of that part of the island is rectified, chiefly from the lights furnished by Richard of Cirencester. Together with a description of the Wall of Antoninus Pius, commonly called Grime's Dyke. To which is added, an appendix, containing detached pieces [all on subjects relating to the Roman and British military history of Britain]. The whole being accompanied with maps of the country, and plans of the camps and stations, &c."

\*ROYLE, JOHN FORBES, M.D., a distinguished living botanist, was educated for the medical profession, and was a pupil of the late Dr. Anthony Todd Thomson, from whom he acquired that love of botany and taste for *materia medica* for which he was afterwards so distinguished. After passing the usual medical examinations in England, he entered the service of the East India Company. In Hindustan he worked with great diligence in the collection of plants, and especially in acquiring a knowledge of their medical properties

and history. He wrote a work 'On the Antiquity of Hindoo Medicine,' in which he included a great amount of valuable information on the subject of the practice of medicine amongst the Hindoos. Having spent a large portion of his time in the Himalaya, where he was superintendant of the East India Company's botanic garden at Saharanpore, he was enabled to form a great collection of plants, and to make observations on other departments of natural history. On his return to England he published his great work, entitled 'Illustrations of the Botany and other branches of the Natural History of the Himalaya Mountains.' This work, which appeared in parts, was commenced in 1839 and finished in two volumes 4to. It contained a large amount of valuable information on the natural products of India, especially those which are useful in medicine and the arts. Although Dr. Royle did not practise medicine, his knowledge of drugs and their uses pointed him out as a fit and proper person for the chair of lecturer on *materia medica* at King's College, London, a position he occupied till the year 1856. The results of his experience in this department of knowledge were given in a volume entitled a 'Manual of Materia Medica,' which has been since the time of its publication a text-book in medical schools. Dr. Royle's botanical knowledge has often been employed on the productive resources of India. He has several times read papers on the cultivation of tea and cotton in India at the meetings of the British Association for the Advancement of Science. His activity at those meetings led to his appointment for a short time as co-secretary with General Sabine of that association. In 1840 he published an 'Essay on the Productive Resources of India.' In 1855 he also published a volume on 'The Fibrous Plants of India,' pointing out those which could be made more especially available for the manufactures of Great Britain. He took an active part in the Great Exhibition of 1851, especially in arranging the East Indian department. He is a Fellow of the Royal and Linnæan societies, and holds an appointment in London in connection with the East India Company.

RUAAULT, JEAN, more generally known by his Latin name Rualdus, was born at Coutances, in Normandy, about the year 1530. He distinguished himself in early life by his knowledge of the classical languages and of ancient history. He afterwards obtained considerable success as a teacher, and was for several years professor of classical literature at the university of Rouen; whence he went to Paris, where his lectures were attended with similar success. His fame as a scholar caused him to be twice appointed to the important office of rector of the university of Paris, and in 1629 he succeeded the celebrated Frederic Morel as professor of 'belles-lettres' in the Collège Royale. He died in 1636.

The erudition of Rualdus is described as having been exact and profound, but fault is found with him as a writer on account of the prolixity of his style and its want of elegance. His oral teaching procured for him a greater reputation than his writings. The work by which he is best known is a valuable edition of Plutarch. The best copy of it is that printed at Paris, of which, as it is now rarely to be met with, we give the title in full: 'Eorundem Plutarchi Operum editio altera Gr. et Lat., ex interpretatione Hermanni Crusarii et Wilhelmi Xylandri, cum notis doctorum variorum et Johannis Rualdi variantibus lectionibus à MSS. codicibus excerptis et indicibus, ex recensione Philippi Joannis Maussacii.' Parisiis. Typis Regiis, 1624, 2 vols. folio ('Bibliographie,' &c., de Bure, art. 6080, Paris, 1768). On account of the rarity of this edition, that of Frankfurt (1620) likewise in 2 vols. folio, is generally used, but it is far inferior to it. There also remain of Ruault—1, A Collection of Latin Poems, 12mo, Paris, 1610: the volume contains two books of epigrams and one of religious poems, besides two harangues on scriptural subjects and panegyrics of St. John the Baptist and St. Ursula. 2, 'Controversia de Duellis,' 8vo, Paris, 1625. 3, A Latin funeral oration on Achille de Harlay. 4, 'Preuves de l'Histoire du Royaume d'Yvetot,' 8vo, Paris, 1631 ('Dict. Bibliographique,' Cailleau, Paris, 1790, vol. ii., p. 513). This being the only edition of this curious work, it is an object of research among the collectors of rare books. Ruault attempts to show that the territory of Yvetot, so celebrated in one of the most popular of French songs, was really constituted a kingdom by Clotaire.

RUBENS, PETER PAUL, the most celebrated painter of the Flemish school, was born at Cologne in 1577, on the 29th of June, the day of St. Peter and St. Paul, whence his baptismal names. His father, John Rubens, who was one of the *échevins* of Antwerp, had taken refuge at Cologne with his family, in consequence of the disturbances prevailing in the Netherlands. In that city he died in the year 1587. His widow shortly afterwards took advantage of the restoration of Flanders to the Roman Catholic faith by the victories of the Duke of Parma, and returned to Antwerp. In his sixteenth year Peter Paul Rubens was placed as a page in the household of the Countess of Lalaing, but the life did not suit him, and he soon returned home. At his own desire he became the pupil, first of Tobias Verhaeght, a landscape-painter, and then of Adrian van Oort, who was celebrated as a colourist. His next master was Otto van Veen, or, as he is commonly called, Otto Venius, court painter to the Infanta Isabella and the Archduke Albert. In the year 1600, when Rubens was twenty-three years old, he was advised by his master to visit Italy. He was already thoroughly conversant with all the technical and general knowledge which would enable him to reap the full benefit from such a journey,

and he had executed some considerable pictures. He proceeded first to Venice, and thence to Mantua, where his letters of recommendation from the Archduke Albert secured him the favour of the Duke Vincenzo Gonzaga. At his court Rubens accepted the place of gentleman of the chamber, and availed himself of the opportunity thus afforded him of studying the frescoes of Giulio Romano and the other works of art then belonging to the family of Gonzaga. In 1601 he went to Rome for a short time, and after returning to Mantua visited Venice, and devoted himself to the study of the pictures of Titian and Paul Veronese. The works of these two masters probably exercised the strongest influence in the full development of his natural genius for colour. The Archduke Albert commissioned Rubens to paint three pictures for the church of Santa Croce in Gerusalemme, at Rome, and he returned thither for that purpose, and with the object of copying some celebrated pictures for the Duke of Mantua, and he probably visited Florence in his way back. In 1605 the Duke Vincenzo Gonzaga sent him on a special mission to Spain with a present for Philip III. That king received him most graciously; and after painting a large number of portraits of persons connected with the court of Madrid, he returned to Mantua. He paid a third visit to Rome, where he was joined by his elder brother Philip, and in 1607 went through Milan to Genoa. In the latter city he executed many works, and a great number of his pictures still remain there. In 1608 he received news of his mother's illness, and returned immediately to Antwerp, where however he arrived too late to find her alive.

The wishes of Albert and Isabella induced Rubens to abandon his project of returning to Italy; and in 1609 he married his first wife, Elizabeth Brants, and settled at Antwerp. The beautiful picture in the Munich gallery, representing himself and his wife seated in a garden, was probably painted shortly after his marriage. The outline is more precise and the style more true and homely than in most of his works. In the year 1620 Rubens was commissioned to paint the series of pictures now in the Louvre which represent the principal events in the life of Maria de' Medici. He went to Paris, and received his instructions for these works, but the pictures themselves were executed at Antwerp, for the most part by the hands of his numerous pupils. In fact, as they were placed in the Luxembourg in 1625, it was physically impossible that he should have painted them himself. The original sketches, now in the Munich gallery, are very far superior to the finished pictures which are now in the Louvre. During his last residence at Paris, Rubens became acquainted with the Duke of Buckingham, who purchased his collection of statues and other works of art for 60,000 florins, or according to De Piles, for 100,000. In 1626 Rubens lost his wife, and he shortly afterwards made a journey, in which he visited the principal Dutch painters of that time.

Rubens had been highly esteemed by the Archduke Albert, and after the death of that prince he continued in the favour of his widow the Infanta. On her return from the siege of Breda, in company with Spinola, in 1625, she visited Rubens's house; and in 1627, when Charles I. declared war against France, Rubens was entrusted with some negotiations with Gerbier, Charles's agent at the Hague. In the autumn of the same year he was despatched to Madrid. During his stay in Spain he executed several very fine pictures, and gained the favour of Philip IV. and the Count-Duke of Olivarez. In 1629 Rubens was sent by the Infanta as ambassador to England. The painter succeeded as a diplomatist, and his merits in procuring Charles's acquiescence in the peace were recognised by the court of Spain. Whilst in England, he stood high in the favour of Charles I., whose feeling for the fine arts seems to have been of the strongest kind. The allegory of War and Peace, now in the National Gallery, was painted as a suitable present to the king, on the occasion of these negotiations. After the breaking up of Charles's matchless collection, this picture was transferred to Genoa, but was purchased during the French revolution from the Doria family, and thus restored to this country. The ceiling of Whitehall was sketched during Rubens's stay in England, but painted at Antwerp at a later period. For the latter work he is said to have received 3000*l*. In 1631 Rubens married his second wife, Helena Forman, a beautiful girl of sixteen. Her portrait often recurs in his pictures. He was again employed on a mission to Holland in 1633; and in December of that year, his patroness, the Infanta Isabella, died.

Rubens's fame now stood very high, and the commissions he received could only be executed by the aid of his numerous and able pupils. In 1635 he became subject to gout in the hands, which disabled him from painting with ease on a large scale. At the request of the authorities of Antwerp, he executed sketches for the decoration of the arches to be erected on the entry of the Cardinal Infant, Don Ferdinand, the new regent of the Low Countries. He died in possession of great wealth, on the 30th of May 1640, in the 63rd year of his age, and was buried in the church of St. Jacques at Antwerp.

Rubens's personal appearance was prepossessing, and his manner and conduct such as to make him generally beloved. Towards other artists he acted with great generosity, and he is said to have relieved the poverty of Vandyck by purchasing all the pictures which that artist had in his studio.

His own character and merits as a painter have been the subject of much controversy, and will probably always furnish matter for discussion. In all questions of literature and art, we are never satisfied

without constantly comparing things which are in themselves utterly dissimilar. The source of pleasure from works of art is obscure, and the nature of the pleasure itself is little capable of definition, but men think to obtain greater precision, and to arrive at the reason why they are pleased, by this process of comparison. To a certain extent perhaps we may succeed, but in general such comparisons have a tendency to narrow our field of enjoyment, and to lead us to dogmatise on what cannot be reduced to fixed rules. A man may derive greater satisfaction from the works of Perugino or Francesco Francia than from those of Rubens or Teniers; he may feel the beauty of the Parthenon more than that of Strasbourg cathedral: but he is not therefore justified in saying that Rubens was a bad painter, or that Erwin of Steinbach was an indifferent architect.

The principal sources of pleasure in painting appear to be form, composition, colour, and, the highest of all, the expression of human character and action. The subdivisions of this last branch are of course infinite, and comprise the higher and holier feelings, as well as those which are more properly a portion of our animal nature. "In those parts of his art which act immediately on the senses, Rubens was without doubt a great master. He understood the perfect management of light and shade, of composition, and colour. If his merits are disputed, it is with reference to the subjects which he painted and to his mode of treating them, not to his technical skill. Before his visit to Italy he had acquired an individual character as an artist. The fruit of his labours there was not a crude mass of detached imitations, but, whilst he carefully studied the great masters at Venice and elsewhere, his vigorous genius assimilated and appropriated to itself all that it took up or borrowed. The excess of individual peculiarity in Rubens certainly amounts to 'manner' in the narrower sense of the word. That peculiarity of feeling too did not dwell on the forms which are best fitted for expressing the tranquil and devotional sentiments which prevail in early Christian art, but still, such as it was, it was eminently characteristic of a 'great painter.' Sculpture exceeds painting in its power of expressing form, and equals it in that of portraying fixed character; but painting only can express the tumult and energy of human action in full power and motion. In this Rubens excelled, and it is surely no mean excellence. We are ready to grant that his Madonnas are, for the most part, clumsy and undignified; that their forms are unfitted for the being whom they represent; and that exaggeration sometimes disfigures scenes where quiet and holy feelings would be more in place. Notwithstanding all this, the stronger human passions and actions have an intense interest for mankind. The animal energy and the sensual characteristics of man are a part of that complex whole which we call human nature, although they are not the most elevated part. If art is to represent man as he is, these elements cannot be wholly overlooked. The Greek drama displayed them too glaringly in the olden comedy, and Greek sculpture embodied them in its fawns and satyrs. An acute sense of beauty indeed generally softened the more disgusting features, and we might wish that Rubens had been oftener touched with similar scruples. We must take him however as he is; with all his technical excellence, and with all the incomparable energy and heartiness which animates his best works. In them there is none of that idle filling up of vacant corners, or that insertion of cold academic figures wholly unconcerned with the scenes portrayed, which we find in works of the same kind by other masters. If we look at Rubens's Village Fête, in the Louvre, the ring of peasants wheel round in the dance with a drunken merriment which seems in actual motion before us. The smaller picture of the Last Judgment, at Munich, is just as wonderful for this quality of movement, as for its glorious colour and execution. His Battle of the Amazons, in the same collection, conveys, in a most wonderful degree, the struggle and energy of a combat. Action and life he never failed to represent as no other painter has done before or since, and this alone, in our opinion, entitles him to a place in the very foremost rank of artists.

In landscape, Rubens's facility of execution and gorgeous colour produce a marvellous effect. His hunting-pieces and portraits are equally celebrated. The picture commonly referred to as the chef-d'œuvre of Rubens is the Descent from the Cross, at Antwerp. The best of his works are in the Munich gallery (which contains no less than ninety-five of his works, principally derived from the Düsseldorf collection) and at Blenheim and Vienna, but there are ten pictures by him, several of them excellent specimens of his different styles, in the National Gallery. Many fine pictures by him remain in Spain, and many of course at Antwerp.

His principal pupils were Vandyck, Jordaens, Snijders, Van Thulden, Kraye, Diepenbeck, and Quellin, but most of them imitated the outward characteristics of their master without catching his fire and energy. The engravers of his school, such as Pontius and Bolswert, succeeded admirably in conveying the general character of those pictures which it would seem most difficult to translate into mere black and white.

We may conclude by saying that Rubens did that for his country which has rarely if ever been accomplished for any other land. At the time of John and Hubert van Eyck, the school of Flanders had attained the highest pitch of excellence. Those artists united a diligent and minute observation of nature to the finest technical skill and the most successful delineation of character and feeling. At a

later period this excellence had vanished, and given way to the crude and affected imitation of the Italian masters which we find in Mabuse and Van Orley. Rubens however a second time placed the Low Countries in the first rank, and by his own genius restored to them a reputation different indeed in kind, but perhaps equal in degree to that which they had formerly enjoyed.

**RUBRUQUIS, WILLIAM DE.** This distinguished traveller of the middle ages was a friar of the Minorite or Franciscan order. Pits, or Piteus, an English Roman Catholic of the 16th century, in his curious biographical work, 'Lives of the Kings, Bishops, Apostolical Men, and Writers of England,' claims him as an Englishman, and as one that did honour to his country. It appears however pretty plainly that he was a native of Brabant. His real name was Ruysbroek, or Rysbruck, which, according to the fashion of the times, he Latinised into Rubruquis. The date of his birth is not preserved, but he was probably born about 1228. He entered the cloisters early in life, and soon after completing his novitiate and taking the major vows he went to the Holy Land, with other monks and missionaries. The recent successes of the fourth grand crusade, under Louis IX. of France, had revived the hopes of the Christians of the west. Fresh streams of pilgrims were flowing thither; and some of these counted upon setting up their tabernacle of rest in Jerusalem, and upon finding provision and settlement for life in the Holy Land.

But before Rubruquis could reach the Syrian shore these hopes were overcast; the devout French king had been defeated near Tunis, rather by endemic diseases than by the sword of the Saracens, and had been made prisoner, with the remnant of his host, by the Mohammedans. Louis however was soon released upon paying a ransom, and entering into a treaty with the Soldan; and he was in Palestine in 1253. Although some monkish envoys, who had previously been sent in quest of that great, undiscoverable, Christian potentate of the East, Prester or Priest John, had returned disappointed, and with very discouraging accounts of the difficulties and perils of their journey, King Louis resolved to send another mission in search of him. A report had reached Louis that the great Tartar, Sartach, son of Baatu-Khan, who commanded in the western parts of Tartary, was a good Christian. If this Sartach was not Prester John, still his faith and devoutness, if truly reported, must make him a valuable ally to the Christians who were warring in the Holy Land against the Paynim. The mission of Louis was therefore to find that Tartar prince, wherever he might be, and at whatever toil and danger. It was composed of Rubruquis, friar Bartholomew of Cremona, and a certain friar Andrew, whose country or birthplace is not named. Rubruquis, though the youngest of the three, appears to have been considered as the head of the mission. He no doubt owed this pre-eminence to his superior scholarship, wit, and courage. Before his departure King Louis strictly enjoined him to write down everything he saw and heard among the Tartars; and by conscientiously obeying the royal order, and by making a good use of his eyes (his ignorance of the Tartar languages made his ears of less account), he brought back a great deal of curious information on the subject of that nomadic people.

After spending a short time at Constantinople among the Greek Christians, whose schism gave them great offence, Rubruquis and his companions took shipping, and entered the Euxine, or Black Sea. On the 21st of May 1253 they were safely landed at Soldaia, now Soudac or Soujac, not far from Cherson, in the Crimea. But here their troubles began. They had brought no presents of any value, and presents are necessary passports through all the East. They were told that they would never get at Sartach unless they had rich gifts to lay at his feet. They however pleaded their vow of poverty as Franciscans, and boldly went on, travelling sometimes in carts and sometimes on rough horses. They crossed the Steppes which separate the Dnieper, or Borysthene, from the river Don, or Tanais, and then directed their course due east, over immense desert plains where nothing was to be seen but earth and sky, and here and there the barrows or tumuli of the Comans. On the 22nd of July, being in a famishing condition, they reached the banks of the Don, where they found some fish, flesh, and dry bread. Crossing the river, they plunged again into the hungry desert. On the 2nd of August they reached the temporary residence, or encampment, of the great Sartach. As they had nothing to give, beyond a little sweet wine, a few preserved fruits, and a bag full of sweet biscuits, their reception was all the sourer. They soon discovered that Sartach's Christianity was all a dream. That Tartar chief however determined to send them on to his father Baatu. From his encampment they had to travel solely on horseback, in the break-neck Tartar fashion. After dreadful fatigue, and many privations and dangers, they reached Baatu, who was encamped on the banks of the Volga, not far from its confluence with the Caspian. Baatu told them that he could enter into no negotiations, and that they must continue their journey until they came to Manchu-Khan, the great Tartar emperor, who was to be found somewhere in the direction of China. Of this long journey "of hunger and thirst, cold and fatigue, there was no end." At last, on the 27th of December, the poor monks arrived at the camp and court of the Tartar emperor, and were lodged in a small dirty hovel. It is not possible to fix the spot where the erratic Manchu-Khan was then residing. Rubruquis only tells us that it was in a vast plain, as flat as the surface of a lake; that, before reaching the plain, he had crossed a lofty range of mountains, and had travelled

due north. The emperor was attended by many Chinese mandarins, and by ambassadors from India, from Persia, and from Turkey. He gave a grand feast, at which all the great men got drunk on cosmos, or the fermented milk of mares. On the 5th of January (1254) the friars were presented at court, where they had to perform several humiliating ceremonies. Manchu-Khan gave them to understand that he was master of the whole world, and that the King of France and all the monarchs of Christendom must submit to him. About the court were a good many Nestorian Christians; but their faith was sadly corrupted, and their priests were little better than conjurors and quacks.

A week or two before Easter, Manchu-Khan removed to Kara-Corum, or Kara-Kûm, a royal city on the east side of the river Orchan. The monks followed him, and were kindly entertained by a French goldsmith, his wife, a Hungarian woman, and one Basilicus, the son of an Englishman, who had been born in Hungary.

On Whit-Sunday Rubruquis was called into the presence of the emperor, who had been told that the friars had called him a foul infidel. Rubruquis solemnly denied the fact. "Then," said the khan, "be not afraid." The brave monk smiled and said, "If I had feared, I should not have come hither!" He was then told that he must return the way he had come, and make himself strong for the journey by eating good meat. He took his departure a fortnight after Midsummer day. "From Kara-Corum," says the good friar, "unto the court of Baatu, our journey lasted four months and ten days, during all which time we never saw a town, or so much as a single fixed house, except one village in which we did not break bread; nor in all this time did we ever rest from our rough riding, except one day when we could find no horses." The court of Baatu was then about to migrate to Sarai, on the eastern bank of the Volga. Rubruquis accompanied it during a whole month; but then, tired of the slow and indirect movements of the Tartars, who as usual were conducting their flocks and herds with them, he procured a guide and pushed rapidly forward for Sarai, keeping due south and always near to the Volga. After a very remarkable journey, the dangers and fatigues of which were supported with admirable temper, and in the course of which he threaded the great defiles of Mount Caucasus, crossed the Araxes, and traversed Armenia, Persia, and Asia Minor, Rubruquis reached Tripoli in Syria in the month of August 1255. He had been altogether about two years and six months on his laborious travels, and he now earnestly besought his superior to allow him to go to King Louis at Paris; for that devout prince had quitted the East after witnessing the failure of all his high hopes. But the Franciscan provincial, being a strict disciplinarian, ordered the poor friar to write to Louis, and then retire to the convent of his order at Acre. The manuscript account of the travels was soon transmitted to Paris, together with an earnest prayer that his Christian Majesty would obtain the provincial's permission for his going for a short season to France. It has not been ascertained whether he obtained the favour, or whether he remained shut up in his cell at Acre. Indeed, after his return to Syria, nothing more seems to be known about Rubruquis except that he was living somewhere as late as the year 1293, when Marco Polo was on his way back to Europe from the remotest regions of the East. He was a man of rare good sense. The sobriety of his descriptions is marvellous for the time in which he lived. He was the first European traveller that gave a correct account of the Caspian Sea.

**RUDDIMAN, THOMAS**, was born in October 1674, at Raggel, in the parish of Boyndie and county of Banff, Scotland. He was instructed in Latin in the parish school of Boyndie, where he made a rapid progress. At the age of sixteen he obtained, at King's College, Aberdeen, the first exhibition or bursary of the year, on account of his superior knowledge of Latin. Here he studied four years, and then took his degree of master of arts, at which time he was well read in the Roman classics. Soon after this he engaged himself as tutor in a private family, and in the course of another year he became schoolmaster of the parish of Lawrence-Kirk. He remained here three years and a half, and then, through the interest of Dr. Pitcairne, he was appointed assistant-keeper of the advocates' library at Edinburgh. In this office, though he had good opportunities of becoming known, and of reading and teaching for his further improvement, yet his pecuniary advantages were so small that he was obliged, in 1707, to commence auctioneer. In the same year he published an edition of Volusenus's 'Dialogue on Tranquillity of Mind,' with a Life of Volusenus, or Wilson, prefixed. In 1709 he published Johnston's Latin 'Poetical Paraphrase of Solomon's Song' and Johnston's 'Cantica.' He was next invited by the magistrates of Dundee to be rector of the grammar-school there, but he declined the offer. In 1713 his friend Dr. Pitcairne died, and Ruddiman, being still an auctioneer, managed the sale of his library, which was purchased by Peter the Great, emperor of Russia. In 1714 he published his 'Rudiments of the Latin tongue,' a book which is well known, and is still generally used in the schools of Scotland. In 1715 he published an edition of Buchanan's works, in two volumes, folio, and in the same year he commenced printer, in partnership with a brother who had been brought up to the business; and some years afterwards he was appointed printer to the University of Edinburgh. He published, in 1725, the first part of his 'Grammaticæ Latinæ Institutiones,' which treats of etymology; and in 1732, the second part, which treats of

syntax. He also wrote a copious treatise on prosody, but published only an abridgment of it. After this time he was made principal keeper of the advocates' library. In 1739 he published Anderson's 'Diplomata et Numismata Scotiæ.' During the latter part of his life he was engaged very much in controversy with different persons. However in 1751 he found time to put forth an edition of Livy, in four vols. 12mo, which Dr. Harwood pronounces one of the most accurate editions ever published. About this time he resigned his post of keeper of the advocates' library, and was succeeded by David Hume.

Ruddiman died at Edinburgh, January 19, 1757, in the eighty-third year of his age. He was the author or editor of some other publications besides those above mentioned, and among them 'The Caledonian Mercury,' from which he is said to have derived more profit than reputation. A Life of Ruddiman was published by Mr. George Chalmers, 8vo, 1794.

RUDING, ROGERS, was born at Leicester, August 9, 1751. He was the second son of Rogers Ruding, Esq., of Westcotes, a member of a highly respectable family, of which notices may be found in Nichols's 'Leicestershire.' This gentleman was receiver-general for the county, and as such came to London to pay the identical money that he received into the Treasury. A friend, to whom Ruding mentioned this circumstance, suggests the possibility that this primitive mode of transacting business may have contributed in some degree to direct the mind of his son to the subject of money transactions. The subject of this article was educated at Merton College, Oxford, of which he was some time Fellow, and by which he was presented, in 1793, to the vicarage of Maldon and Chessington, two small adjoining parishes in Surrey, which are always held together. He took the degrees of B.A., 1771; M.A., 1775; and B.D., 1782. Mr. Ruding married a cousin of the same name, and by her had three sons, none of whom survived him, and two daughters.

Ruding's attention appears to have been early directed to the defects of our monetary system, and in 1798 he published a pamphlet, entitled 'A Proposal for restoring the ancient Constitution of the Mint, so far as relates to the expense of Coinage; together with a plan for the improvement of Money, and for increasing the difficulty of Counterfeiting.' In 1812 he issued proposals for his great work, which was published in 1817, in four quarto volumes, under the name of 'Annals of the Coinage of Britain and its dependencies, from the earliest period of authentic history to the end of the fiftieth year of his present majesty King George III.' The whole of the first edition being sold within six months, it was shortly followed by another, in octavo, which brought down the history to the middle of the year 1818; the additional matter being also printed in the form of a supplement to the first edition. This important work, on the compilation of which Mr. Ruding bestowed no ordinary amount of laborious research, contains a chronological history of the monetary affairs of this country, the constitution of the Mint, the process of coinage, and the numerous and often ineffectual measures adopted to prevent the deterioration and counterfeiting of the money. It also embraces an account, geographically arranged, of all the Mints and Exchanges formerly existing in various parts of the kingdom; and a description of the coins, illustrated by a series of more than a hundred plates, including those previously published as tables of English gold and silver coins, by Martin Folkes, Esq., which were lent by the Society of Antiquaries for the purpose.

Viewed simply as an historical work, Ruding's 'Annals of the Coinage' is a book of great value and interest, embracing as it does the result of the author's diligent investigation of a subject to which very few could devote sufficient attention; but the work had another object, which may be explained by an extract from the author's preface. He observes "Had these materials been collected for no other purpose than the amusement of antiquarian curiosity, I should have held myself blameable for the misapplication of much precious time. But this work is given to the world with a higher and more important view. Its object is to show, from the experience of ages, the inadequacy of punishment, however severe, to prevent the commission of the crime of counterfeiting the money, whilst the temptation to it remains so powerful, and the execution of it so easy. The long succession of penal statutes, and the innumerable lives which have been forfeited to them, seem to prove that the system is radically defective, and that the crime can be prevented only by counteracting and weakening the force of the temptation." Ruding considered his theory to be supported by the great re-coinage of 1816 and 1817, at which time the weight of the coins was so much diminished as to remove the temptation to melting them down, while the coarseness of the workmanship afforded such facility to imitation, that the real coins and the counterfeiters were ready for delivery almost at the same instant. A new edition of this important work, extended to the commencement of the reign of Victoria, edited by J. Y. Akerman, Esq., aided by other numismatists, has been published by Mr. Hearne, in three volumes, quarto.

Mr. Ruding communicated many papers on coins, &c., to the 'Gentleman's Magazine,' and memoirs on the trial of the pix and the office of cuneator (which were, in fact, little more than chapters of his larger work, perhaps put forth in that form to excite interest on the subject) to the 17th and 18th volumes of the 'Archæologia' of the

Society of Antiquaries, of which he was a Fellow. He was also an honorary member of the Antiquarian Society of Newcastle-upon-Tyne. He died at Maldon, on the 16th of February 1820, in his sixty-ninth year.

RUDOLF OF HABSBURG. [HABSBURG, HOUSE OF.]  
RUFFO, FABRIZIO, born about the middle of the 18th century, was a younger son of a noble and wealthy Neapolitan family. He was brought up for the church, for which however he had little disposition. Being introduced at Rome to Pope Pius VI., he was appointed treasurer, in which capacity he exhibited considerable economic abilities, and he incurred the jealousy of many of the older members of the Roman court. At last he resigned his office on being made a cardinal, and returned to Naples, where King Ferdinand I. appointed him intendant or chief administrator of his palace and domain of Caserta. Ruffo was fond of agriculture, and he applied himself to make improvements on the estate. When King Ferdinand was driven away from Naples by the French republican army in 1798, Ruffo followed him to Sicily. He had disapproved of the provocation given to the French by the court of Naples, and he was consequently at variance with the favourite minister Acton. The latter, in order to get rid of his presence, recommended him to Queen Caroline as a fit man to recover the kingdom of Naples by placing himself at the head of the Royalist population of Calabria, in which province the family of Ruffo had large estates, and exercised considerable local influence. The queen approved of the plan, however hazardous it might appear, and made the king sanction it by bestowing on Ruffo the rank of his vicar-general, with full powers to act. Ruffo, glad to escape from the intrigues and vexations of the court of Palermo, accepted the office. In February 1799 he crossed over in a boat with an escort of only five men and 3000 ducats, and landed at Bagnara, a fief of his family. He collected a number of adherents, and unfurling the royal flag with a white cross, proclaimed a crusade against the French and their partisans. The republicans of Naples had committed many errors and acts of oppression in the provinces, and had exasperated the rustic population, which were not ripe for the change from old absolutism to a republican form of government. The Calabrians flocked by thousands to Ruffo's standard. The army of "the Holy Faith," which was the name it assumed, marched against the town of Monteleone, which surrendered by capitulation, as well as Catanzaro; it afterwards stormed Cotrone, which was given up to plunder; took Cosenza through the treason of its commander; and thus in less than a month Ruffo was master of all Calabria, where he re-established the king's government. He was joined by many regular officers and soldiers, and was supplied with artillery. He then took the road to Apulia, and laid siege to Altamura, which opposed his passage. The inhabitants defended themselves desperately, but the town was taken and plundered for three days with circumstances of great atrocity. The people in other parts of Apulia hoisted the royal flag; the Abruzzo was already in open revolt against the republicans of Naples, who were soon after abandoned by the French troops, which withdrew at the beginning of May towards North Italy, in order to oppose the Austrians and Russians, who were predominant in that quarter. Naples was left to its fate with only a small French garrison in one of the castles. On the other side Ruffo was joined by some regular Russian and Albanian forces from Corfu. He then advanced towards Naples by Avellino, and surrounded the capital at the head of from fifty to sixty thousand, mostly irregulars. After some fighting outside the town, an insurrection of the lower orders from within facilitated the entrance of Ruffo's bands, and the town became a scene of carnage; but the republicans still defended themselves in the castles and the adjacent districts, where they had fortified the massive palaces and houses. Ruffo, willing to spare further destruction, entered into a convention with the republicans, who were to be shipped off for France. The capitulation was signed by him, and a part of the republicans were actually sent off to France, when King Ferdinand arrived from Sicily in the bay, at the end of June, on board the English admiral Nelson's ship, and refused to sanction the capitulation, saying that Ruffo had exceeded his powers in treating with rebels, and he appointed a special court to try the republicans, many of whom, chiefly of the higher orders of society, were put to death. The minister Acton charged Ruffo with partiality for the Jacobins, as they were called, and the cardinal, disappointed and humiliated, seized the opportunity of leaving Naples for the conclave, which had been summoned to assemble at Venice for the election of a pope. Ruffo followed the new pope, Pius VII., to Rome, where he was made Prefect of the Annona. Some years after he returned to Naples, where he resumed his place at the court. When the court of Naples was obliged to emigrate a second time to Sicily in 1805, in consequence of its own imprudence and tergiversations, Queen Caroline proposed to Ruffo to put himself again at the head of the country people to oppose the French, but Ruffo replied that "once was quite enough in a man's life for such vagaries." He retired to Rome, where he remained till 1809, when he went to France and made his peace with Napoleon, and he was one of the cardinals who sanctioned by his presence his second marriage. In 1814 he rejoined Pope Pius VII. at Rome. After a time he returned to Naples, and took again his seat in the council, where he displayed a marked moderation of sentiments. He went to Rome in 1823 to the conclave in which Leo XII. was elected, and died at Naples in 1827 at an advanced age.

Ruffo was a man of ability and accomplishments. He was worldly and lax in principles, by no means fanatical or cruel; and the atrocities which disgraced his otherwise romantic expedition of 1799 cannot be justly attributed to him, although he may be blamed for not reckoning on them before he put himself at the head of the insurrectionary movement.

Contemporary with this Ruffo, there was another Cardinal Ruffo, of another branch of the same family, who was long Archbishop of Naples.

(Petromasi, *Storia della Spedizione del Cardinal Ruffo*; Colletto, *Storia del Reame di Napoli*; Coppi, *Annali d'Italia*; *Sketches of popular Tumults*.)

RUFINUS, LICINIUS, a Roman jurist, who lived under Antoninus Caracalla (A.D. 211-217), whom he mentions once ('Dig.' 24, tit. i. s. 41). He was also consulted by Paulus ('Dig.' 40, tit. 13, s. 4). There are seventeen excerpts in the Digest from a work of Rufinus entitled *Regularia*. The Florentine Index mentions only twelve books of this work, and the superscription 'Lib. xiii.' in a passage of the Digest (42, tit. 1, s. 34) may be a mistake. (Zimmern, *Geschichte des Röm. Privatrechts*, i. 382.)

RUFINUS, also called TORANUS, a priest of Aquileia, and according to some writers a native of that place, was born about the middle of the 4th century. He embraced a monastic life, and lived at first in a monastery at Aquileia, where he devoted himself to the study of the Scriptures and of the Greek and Roman fathers. During this time he became acquainted with St. Jerome, who was for a long time most sincerely attached to him. Rufinus subsequently visited Egypt, where he formed the friendship of St. Melania, who was celebrated in the church for her works of charity and love. He afterwards went to Palestine, where he encountered the opposition of the Arians, who banished him to the most desolate part of the country. He was ransomed however by Melania, and returned with her to Jerusalem, where he built a monastery on Mount Olivet, and lived for many years. During his stay at Jerusalem he translated some of Origen's works, by which he offended his former friend Jerome, who attacked him in his 'Apology.' To this work Rufinus wrote a reply, in which he maintained his own orthodoxy and defended himself by appealing to the example of Jerome, who had formerly praised and also translated some of Origen's works. This controversy excited a great stir at the time, as both writers were of high reputation and had many partisans. The Western Church however was generally opposed to Rufinus, and on his return to Aquileia he was cited by Anastasius, the bishop of Rome, to appear before him; and on his not doing so, his writings were condemned, and he was deprived of his rank as presbyter at Aquileia. He subsequently retired to Sicily, where he died about the year 410.

Rufinus translated into Latin the works of Josephus; the 'Ecclesiastical History' of Eusebius, to which he added two books continuing the history to the death of Theodosius; the books of Recognitions attributed to Clement; several of Origen's works, with the first book of Pamphilus's 'Apology' for Origen; the 'Orations' of St. Gregory Nazianzen; the ascetical rules of St. Basil; and a few other smaller treatises of the Greek fathers. The translations of Rufinus are rather paraphrases than strict and literal versions. Besides these translations Rufinus wrote two books in reply to St. Jerome, which have been already mentioned; an 'Apology' to Anastasius, bishop of Rome; an 'Explanation of Jacob's Blessing'; a 'Commentary upon Hosea, Joel, and Amos'; and an 'Explanation of the Apostles' Creed,' a work which is considered by modern theologians of considerable importance, as it contains a complete catalogue of the books of the Old and New Testament.

The opinion of Du Pin upon the literary and theological merits of Rufinus is just and impartial:—"It must be acknowledged that Rufinus, though very ill used by St. Jerome, was one of the ablest men of his time. Perhaps he had not so much learning as St. Jerome, but his temper was better and less violent. He doth not write such good Latin, but his style is more even. It cannot be denied that the Latin church is indebted to him for the knowledge of the most considerable among the Greek authors, and particularly of church history. Though he was accused of divers errors, yet he was convicted of none, and he justifies himself sufficiently from the reproachful objections made against him."

The works of Rufinus were published by Sonnius in 1 vol. folio, Paris, 1580.

(Du Pin, *A New History of Ecclesiastical Writers*, vol. ii., pp. 107-111, transl.; Lardner, *Credibility of the Gospel History*, vol. iv., p. 482, London, 1831, and the references there given.)

RUFUS, or RUPHUS (Ρούφος), commonly called Rufus Ephesius, from the place of his birth, is said by Abul-fara ('Hist. Dynast,' p. 59) to have lived in the time of Plato, about four hundred years before Christ; John Tzetzes calls him the physician to Cleopatra, who died B.C. 30 ('Chil.' vi.; 'Hist.' 44, v. 300, p. 104); but Sprengel ('Hist. de la Méd.') and most modern authors follow Suidas in placing him in the reign of Trajan, about the beginning of the 2nd century after Christ. He is sometimes confounded with Menius Rufus, the inventor of several compound medicines, who however must have lived long before the reign of Trajan, as he is quoted by Andromachus (Galen, 'De Compos. Medicam. sec. Loca,' lib. vii., tom.

xiii., cap. v., p. 92), who was archiater to the emperor Nero. Nothing is known of the events of his life, except that he wrote several works, of which the titles are preserved by Galen and Suidas, and three are still extant.

The first consists of four books (the second book however is merely another version of the first) entitled *Περὶ Ονομασίας τῶν τοῦ Ἀνθρώπου Μελῶν*, 'De Appellationibus Partium Corporis Humani,' which are chiefly valuable for the information they impart concerning the state of anatomical science before the time of Galen. His principal object in this work was to give a general idea of anatomy, and particularly to prevent the medical students of his time from making mistakes in reading the ancient authors, who do not always call the same parts of the body by the same name. From what Rufus says in this book (p. 33), we find that all the anatomical demonstrations were made upon beasts. (Compare Theophilus, 'De Corp. Hum. Fabr.' lib. v., cap. ii., who says, "choose an ape for dissection, if you have one; if not, take a bear; and if you have not a bear, take any animal you can get.") He considered the spleen to be absolutely useless (p. 59). We find also in the same book, that the nerves now called recurrent were then quite recently discovered. "The ancients," said Rufus (p. 42), called the arteries of the neck *καρωτίδες* or *καρωτικοί*, because they believed that when pressed hard, the animal became sleepy and lost its voice; but in our age it has been discovered that this accident does not proceed from pressing upon these arteries, but upon the nerves contiguous to them." He shows that the nerves proceed from the brain, and he divides them into two classes, those of sensibility and those of motion (p. 36), though, like Celsus ('De Medic.' lib. vii., cap. 18, p. 413, ed. Argent.), he reckons (p. 41; compare p. 43) among them the cremaster muscle. (Julius Pollux, himself a contemporary of Galen, gives also the name of *νεῦρα* to the ligaments which unite the bones: 'Onomast.' lib. ii., cap. 5, segm. 234, p. 265.) According to Sprengel ('Hist. de la Méd.'), he was the first to describe, though very imperfectly, the commissure of the optic nerves at the height of the infundibulum, and the fibres which they receive from the brain. (p. 54.) He clearly describes the capsule of the crystalline lens by the term *ὀμὴν φακαιοῦ*, 'lenticular membrane.' (p. 37.) He considered the heart to be the seat of life, and noticed that the left ventricle is smaller and thicker than the right. (p. 37.) This work was first published in a Latin translation, by J. P. Crassus, with Areteus, Venet., 4to, 1552.

The next work of his that remains is a valuable little treatise, *Περὶ τῶν ἐν Νέφροισι καὶ Κύστει Παθῶν*, 'De Renum et Vesica Morbis,' in which however there is nothing that requires particular notice here. The third is a fragment, *Περὶ τῶν Φαρμάκων Καθαρτικῶν*, 'De Medicamentis Purgantibus.'

These three works were first published in Greek, by J. Goupyl, Paris, 8vo, 1554. There is an edition by Clinch, Greek and Latin, 4to, Lond., 1726, which is not of much value. The most complete is that by Matthæi, 8vo, Mosq., 1806, Græce, in which he has supplied, from a manuscript at Moscow, several fragments that had never before been published. A Latin translation of Rufus is inserted in the 'Medicæ Artis Principes,' by H. Stephens, fol., Paris, 1567. Some Greek fragments are to be found in the fourth volume (pp. 198-200) of the collection of 'Classici Auctores Æ Vaticanis Codicibus editi,' published by Angelo Mai, 8vo, Romæ, 1831. C. G. Kühn published Lips., 1831, 'Rufi Ephesii de Medicam. Purgant. Fragm. Æ Cod. Paris. descript.'; and F. Osann wrote a dissertation, 'De Loco Rufi Ephes. Med. ap. Oribasium servato, sive de Peste Lib.' Giss., 1833. There are also several fragments preserved by Oribasius and Aëtius and among the rest the formula for the composition of a celebrated medicine called 'Hiera' (Oribas., 'Synops.' lib. iii., pp. 121, 122), which appears to have been a common name among the ancients, for what may be called patent medicines, as Aëtius has inserted in his compilation (Tetrab. i., serm. 3, cap. 114) the formula of one called, after the celebrated Archigenes, 'Hiera Archigenis.' A Latin version of a treatise on the Gout attributed to Rufus was published by Littré in the 'Revue de Philologie,' vol. i., 1845; and, with less apparent reason, a treatise on the Pulse in Greek, with a translation in French by C. Daremberg, 8vo, Paris, 1846.

Haller is inclined to attribute to Rufus ('Biblioth. Botan.' tom. i., p. 108) an anonymous fragment of one hundred and ninety Greek hexameter verses, *Περὶ βοτάνων*, 'De Viribus Herbarum,' which was first published in the Aldine edition of Dioscorides, 4to, Venet., 1518, p. 231, &c., and which is inserted by Fabricius, with Greek scholia and a Latin translation and notes, by J. Rentorf, in his 'Bibliotheca Græca,' tom. ii., pp. 629-61 (old edit.) Fabricius and others have also been of the same opinion. Hermann, on metrical grounds ('Orphica,' 8vo, Lips., 1805, pp. 717, 750, 761, &c.), determines the writer to have lived some time between Manetho, the author of the *ἀποτελεσματικά*, and Nonnus, the author of the 'Dionysiaca'; but this date is sufficiently vague. Rufus certainly composed a poem in Greek hexameters, *Περὶ βοτάνων*, in four books, which is mentioned by Galen ('De Facult. Simplic. Medic.' lib. vi., Præfat., tom. xi., p. 796, ed. Kühn), and of which he quotes a few lines ('De Compos. Medic. sec. Loca,' lib. i., cap. 1, tom. xii., p. 425); but this is supposed by Choulant ('Handbuch der Bücherkunde für die Aeltere Medicin,' 8vo, Leipzig, 1828) to have been quite a different work from the fragment now spoken of, chiefly on the ground that so scientific and sensible a physician as

Rufus would not have written anything so full of popular superstitions and absurdities. The fragment treats of thirteen different plants in as many chapters, in which, says Haller, "Medicarum virum adest farrago verarum et falsarum."

RUGENDAS, GEORG PHILIPP, a celebrated German battle-painter, was born at Augsburg in 1666. He was the pupil of Isaias Fisches, an eminent historical painter in his time; but Rugendas devoted himself at an early age almost exclusively to battle-painting, in which he was partly confirmed by the admirable battle-pieces of Bourguignon, Lembke, and Tempesta, which he studied on his journey to Vienna, Venice, and Rome. At Rome he entered the famous Flemish *Schilder-Bent*, or Society of Painters, in which he was received, from his predilection for battle-painting, under the nickname of *Schild*: all the members of this society were known only by nicknames.

In 1695, after an absence of five years, he returned to Augsburg, and had the opportunity of witnessing its siege in 1703, and of thus studying from nature what he had hitherto only acquired from his imagination, and from the pictures of others. He lost a great portion of his property through this siege; but what he lost in substance he more than gained by the excellent opportunities he found of perfecting himself in the line of art which he had adopted, and he acquired extraordinary excellence as a battle-painter. He became distinguished also for his etchings of battles and skirmishes: he excelled in the manner in which he represented smoke, and made use of it in separating and arranging his groups. There is, or was, a large picture of the siege of Augsburg in the Stetten collection at Augsburg. Rugendas was made director of the Academy of Augsburg in 1710: he died at Augsburg in 1742. His pictures are very numerous, and there are not many collections without one or more examples of his style. He painted, besides battles and skirmishes, horse-markets and horse-exercises, and he generally introduced many objects into his pictures. His design is vigorous and bold, but his colouring is unequal, sometimes being high and warm, and at others heavy and monotonous; and though his light and shade is often well studied and effective, many of his pictures are now black and obscure. Owing to an illness, he painted many years with his left hand. There is a picture of the battle of Blenheim by Rugendas. He was the ancestor of a numerous family of painters and engravers, sons and grandsons. A life of him by J. C. Füssli was published, together with a life of Kupetzky, by the same writer, 'Leben Georg Philipp Rugendas und G. Johann Kupetzky,' Zürich, 1758.

CHRISTIAN RUGENDAS, his second son, engraved about sixty of his father's designs in a very spirited manner, chiefly in mezzotinto. His own etchings, of which there are about thirty, are also much prized.

RUHNKEN, DAVID, was born in 1723 at Stolpe, in Pomerania. His parents, who were in good circumstances, soon discovered the promising talents of the boy; and, after a course of elementary instruction, they sent him to the gymnasium of Königsberg (Collegium Fridericianum, or Friedrichs-Collegium). Here he commenced his acquaintance with the classical writers of antiquity, and conceived that love for them which distinguished his whole life. He also made great progress in the fine arts, particularly in music and drawing. After finishing his studies at the gymnasium, it was the wish of his parents that he should become a student of theology; but this was contrary to his own inclination, and he obtained permission to go to Göttingen, where he anticipated great benefit from the instruction of J. M. Gesner. On his journey thither he passed through Wittenberg, and the kindness and hospitable reception which he experienced in the houses of two distinguished professors of that university, Berger and Ritter, induced him to stay at Wittenberg, where he remained two years, and applied most indefatigably to the study of ancient literature, history, and jurisprudence. On the occasion of taking his degree he published his inaugural dissertation, 'De Galla Placidia Augusta' (Wittenb., 1743), a work which raised the greatest expectations of the young scholar. Ernesti, who happened to be at Wittenberg at the time, advised Ruhnken to go to Leyden, and finish his studies under the auspices of the great Hemsterhuis. This advice coincided with Ruhnken's own wishes; and, having provided himself with letters of introduction, he went to Leyden. To Hemsterhuis he had no introduction; but he nevertheless, immediately after his arrival, paid a visit to that renowned scholar, who received him with the utmost kindness. Ruhnken now began his studies afresh, following the suggestions and advice of his great master, and continued his studies under him for six years, during which he read almost all the Greek writers with the greatest care and attention. But notwithstanding his severe application, he was fond of amusements: musical entertainments, the conversation of ladies, and hunting, were now, and remained during his whole life, his favourite recreations; and often, after returning from hunting, he would sit down all night at his writing-table, and make up for the time spent on his amusements. Hemsterhuis had from his first acquaintance with him discovered the great abilities of his pupil, and was anxious to keep him at Leyden; but as there was at the time no prospect of a professorship becoming vacant in the university, he advised him to resume his former study of the Roman law. Ruhnken, who was accustomed to follow the advice of Hemsterhuis like that of a father, complied with his request, and soon made such progress as to gain a considerable reputation as a jurist. But he did not neglect his favourite pursuits, and made preparations

for a new edition of Plato. With this view he collected the scholia on Plato, and published a very valuable edition of Timæus, 'Lexicon Vocum Platoniarum,' with a commentary, Leyden, 1754 (a new and much improved edition appeared in 1789). But as he had no appointment in Holland, his friends in Germany urged him to return and apply for a professorship in some university in his own country. His attachment however to his friend and master, and his love of the mode of life at Leyden, induced him to wait there until a vacancy should occur. In 1755 he went to Paris, where he spent a whole year in examining the manuscripts of the Royal Library and those of the library at St. Germain. About the time when he was preparing to set out for Spain, he received the intelligence that Hemsterhuis had succeeded in gaining for him the appointment of lector (reader) in the University of Leyden. In this capacity he was the assistant and colleague of his former master. Ruhnken returned to Holland, and in October 1757 he opened his course of lectures by a discourse, 'De Græcia Artium et Doctrinarum Inventrice' (printed at Leyden in 1757, 4to). Ruhnken filled this place for four years, and his zeal, his success, and his erudition, soon gained him the reputation of being one of the most eminent scholars of Holland.

In 1761 Oudendorp died, and Ruhnken was appointed his successor as professor of eloquence and history. In the same year J. M. Gesner of Göttingen died, and Ruhnken was invited to take his chair; but he refused this honourable offer, and recommended Heyne in his stead. This proof of his attachment to the University of Leyden was rewarded by a considerable increase of his salary. At the age of forty Ruhnken married a beautiful and accomplished young lady, with whom he lived very happily; but in the year 1769 his wife began to suffer from apoplexy, which first deprived her of speech, and afterwards also of sight, and in this deplorable state she survived her husband. In 1767, two years before this calamity, Hemsterhuis had died, and Ruhnken, then rector of the university, delivered a noble eulogium on his late friend and patron. This eulogium is known under the name of 'Elogium Tiberii Hemsterhusii,' printed at Leyden in 1768, in 8vo; a second edition, accompanied by two letters of R. Bentley to Hemsterhuis, appeared in 1789. About this time Ruhnken conceived the plan of making a new and complete edition of the great works of Fabricius, the *Bibliotheca Græca et Latina*, but this plan was never realised, and other works, of which we subjoin a list, occupied almost all his attention. In 1774 Ruhnken succeeded Gronovius in the office of librarian to the university, in which capacity he enriched the library with a great many valuable books and manuscripts.

The life of Ruhnken henceforward presents scarcely any incidents: his time was divided between the discharge of his official duties and his literary occupations, by which he acquired a reputation equal to that of his master Hemsterhuis. To his suffering wife he always showed the greatest affection, and all the leisure hours which he could spare he devoted to her. The only thing which in some degree interrupted his quiet pursuits were the disturbances which broke out in Holland in the year 1787. He died on the 14th of May, 1793, leaving two daughters, the younger of whom had from her childhood always been in bad health. The city of Leyden purchased his valuable library, and granted to his widow an annual pension of 500 florins.

Ruhnken was one of the most eminent scholars and critics of the 18th century. With a refined taste and great acuteness, he combined an extraordinary memory and immense erudition. His critical sagacity and his grammatical knowledge were not inferior to those of any modern philologist, and his works are still an inexhaustible source of information, though it has, perhaps not unjustly, been observed, that Ruhnken, as a critic, is more refined and elegant than profound. As a Latin writer Ruhnken has scarcely been excelled by any modern author. In teaching he was very successful; the most distinguished among his pupils was Daniel Wyttenbach, to whom we are indebted for an eloquent Life of his master (Leyden, 1799, 8vo.). This Life was reprinted at Leipzig in 1822, and edited by Lindemann, together with the *Elogium Hemsterhusii*, under the title 'Vitæ duum Virorum Tib. Hemsterhusii et D. Ruhnkenii.'

Besides his edition of the *Lexicon* of Timæus, Ruhnken wrote, in 1754, a commentary on the title in the Digest and Code, 'De Postulando, sive de Advocatis et Procuratoribus.' He also edited the second volume of Alberti's *Hesychius*, with notes and emendations, Leyden, 1766, fol.; *Rutilius Lupus*, 'De Figuris Sententiarum et Elocutionis,' Leyden, 1768 (a new edition of this work was published at Leipzig in 1831 by Frottscher); *Velleius Paterculus*, 2 vols. Leyden, 1779 (a separate edition of Ruhnken's commentary was published at Hanover, in 1815, by Cludius); 'Homeri Hymnus in Cererem,' with a Latin translation and Commentary, 1780 (a second edition appeared in 1782, in which a fragment, until then unknown, was added); 'Mureti Opera,' 4 vols. 8vo, Leyden, 1789. Besides these editions of ancient authors by Ruhnken himself, he communicated to Ernesti his remarks on Callimachus (Leipzig, 1761), and on Xenophon's 'Memorabilia' (Leipzig, 1773), and to Schweighäuser those on Polybius and Appian. Besides his three original compositions already mentioned (viz. on 'Galla Placidia Augusta,' 'De Græcia Art. et Doctr. Inventr.,' and the 'Elogium Hemsterhusii'), Ruhnken wrote 'Epistolæ Criticæ: prima in Homeridarum Hymnos et Hesiodum' (Leyden, 1749); 'se-

cunda in Callimachum et Apollonium Rhodium' (Leyden, 1751); 'Oratio de Doctore Umbratico,' 1753, 4to; 'Dissertatio de Vita et Scriptis Longini,' 1766, 4to; (reprinted in Toup's edition of Longinus). These discourses and essays were collected and published by Ruhnken himself in 1797, in 2 vols., under the title 'Ruhnkenii Opuscula Oratoria, Philologica, Critica, nunc primum conjunctim edita.' A new edition, with some additional dissertations, was edited by Bergmann, in 2 vols., Leyden, 1823. Some parts of the correspondence of Ruhnken with his learned friends have likewise been published. J. A. H. Tittmann has edited 'Ruhnkenii, Valckenarii, et aliorum ad J. A. Ernesti Epistolæ; accedunt Ruhnkenii Observationes in Callimachum,' &c., Leipzig, 1812. Mahne has edited 'Ruhnkenii et Valckenarii Epistolæ mutus,' Vliessingen, 1832, and 'Ruhnkenii Epistolæ ad Diversos,' Vliessingen, 1834.

RUISCH, RACHEL, a distinguished Dutch flower-painter, was born at Amsterdam in 1664: she was the daughter of Professor Ruisch, who had her taught flower-painting by Wilhelm Van Delst. In 1695 she was married to the portrait-painter Juriaen Pool, who was two years her junior, to whom she bore ten children and with whom she lived fifty years. In 1701 she and her husband were elected members of the Society of Painters of the Hague, and in 1708 John William elector of the Pfalz, appointed her his court painter. She died at Amsterdam in 1750, aged eighty-six, and she continued to paint till she was upwards of eighty years old. Her works have been compared with those of Van Huysum and De Heem, and have sometimes been sold for very high prices, even 8,500 francs for a single picture.

(Van Gool, *Nieuwe Schouburg der Nederlantsche Kunstschilders*, &c.; Van Eynden and Vander Willigen, *Geschiedenis der Vaderlandsche Schilderkunst*, &c.)

RUMFORD, BENJAMIN, COUNT, was born at Woburn, Massachusetts, on the 23th of March 1752. His family name was Thompson. For awhile a merchant's clerk, he turned to the study of medicine, then became a tutor, and eventually a schoolmaster at Rumford (now Concord) in New Hampshire. Released by his marriage with a young and wealthy widow from the necessity of acting as a teacher, he turned to scientific pursuits; but when the revolution commenced he became a major of militia, and for his services to the king's cause obtained an appointment in the Foreign Office. During the contest he returned to New York, and raised a regiment of dragoons, of which he was appointed colonel. In 1784 he returned to England, was knighted, and is said for some time to have acted as one of the under-secretaries of state. He subsequently entered the service of the King of Bavaria, and rose rapidly to a high position in the state. He is said to have accomplished many social improvements, amongst which were plans for the suppression of mendicancy and for relieving poverty and elevating the poor; besides various civil and military reforms, for which several orders of knighthood were conferred upon him, and he was made a lieutenant-general and created a count. From the time when he was compelled to leave America he had been separated from his wife and child; but he took for his title the name of her native town, which was also the birthplace of his child, who now (in her twentieth year) joined him on the death of her mother. Towards the close of the century he once more came to England, and devoted his time to experiments on the nature and economical application of heat, and assisted in founding the Royal Institution. In 1802 he went to reside at Paris, and married the widow of Lavoisier, the chemist, but soon afterwards separated from her. He then retired to Auteuil, a village near Paris, and, having a handsome pension from the King of Bavaria, devoted his time to rural pursuits and to chemistry and natural philosophy. He died on the 21st of August 1814.

The plans of Count Rumford for improving the arts and conveniences of domestic life have rendered his name well known in England. An account of these will be found in his 'Essays, Political, Economical, and Philosophical.' Several of these essays were published separately, and effected much good at a time when the amelioration of the condition of the poor was attracting great attention. His views are enlightened as well as benevolent, and on the whole he appears to have been in advance of his time. Two volumes of the 'Essays' were collected and published in 1798, and a third in 1802. In the latter year also was published a volume of 'Papers on Natural Philosophy and Mechanics.' Some of these had been read before the Royal Society, in whose 'Transactions' they are also printed.

RUMIANTSOV. [ROMANZOV.]

RUMOHR, CARL FRIEDRICH LUDWIG FELIX, VON, a distinguished writer on art, was born of an old family at Reinhardtsgrün, his father's estate near Dresden, in 1785. He was educated at the Gymnasium, or high school of Holzmünden, in Brunswick, whence he went to the University of Göttingen; but already at the age of fifteen he neglected every other study for that of art, abruptly discontinuing his studies at the university and placing himself with the painter J. D. Fiorillo, well known as the author of a general history of modern painting, and then established in Göttingen. From Fiorillo, Rumohr heard much about Italy which excited his imagination, and determined him to visit that country as soon as he had acquired some knowledge of the various schools and styles of art. He accordingly visited many collections; but above all the celebrated

gallery of Dresden attracted his attention, and especially the works of Raffaele and Paul Veronese. In 1804, in his twentieth year, he made his first tour in Italy, and visited Bologna, Florence, Siena, and Rome. In Rome he made the acquaintance of Thorwaldsen, Schick, Friedrich Tieck, and Koch the landscape painter; Carstens had already left. He further enjoyed the friendship of Wilhelm and Alexander von Humboldt, and Monsignore della Genga, nineteen years afterwards Pope Leo XII.

From Rome, Rumohr went to Naples, and there commenced the formation of a collection of antiquities: he had already been collecting prints for some years. He returned to Germany in 1805, in the company of Ludwig Tieck. In Bavaria he was honoured with the confidence of the crown prince, afterwards King Ludwig of Bavaria. From 1805 to 1815 his time was passed chiefly in Bavaria and on his own estates in Holstein. Though he took great interest in the political changes of that time, he meddled very little with them. His literary activity commenced soon after his return from Italy, but his first publication appeared in 1811—'Erklärungen einiger artistischen Bemerkungen in der Abhandlung des Herrn Hofraths Jacobs über den Reichthum der Griechen an Plastischen Kunstwerken.' This was followed by other essays on various departments of art, and among them a work entitled 'Sammlung für Kunst und Historie,' 2 vols. 8vo, Hamburg, 1816.

In 1815 he revisited Italy, and commenced in Florence the researches for his principal work, the 'Italienische Forschungen,' of which the three volumes were published in two portions in a later period of his life. In Rome he found Overbeck leading the German artists into a new or rather old sphere of art [OVERBECK], which forcibly impressed Rumohr. In 1827 appeared at Berlin the first and second volumes of the 'Italian Researches' ('Italienische Forschungen'), a critical work on the history of art, and compiled exclusively from the original archives and documents in various buildings at Florence; in this work Rumohr clears up many obscurities and corrects several errors in Vasari. In 1828 he paid a third visit to Italy, when he was consulted in the purchases for the new picture-gallery which was then being established at Berlin, and he acted as cicerone to the present King of Prussia in Florence, when crown prince. He was employed by the prince in several purchases, and upon his return to Germany was engaged with others in the selection and arrangement of the objects of art in the museum. In 1831 Rumohr published the third and last volume of his 'Italienische Forschungen,' and various literary works now followed in rapid succession and on various subjects. In 1832 appeared 'König's Geist der Kochkunst,' at Stuttgart; 'Deutsche Denkwürdigkeiten,' at Berlin; 'Drei Reisen nach Italien,' at Leipzig; and the first volume of his 'Novellen,' at Munich: in 1834, 'Schule der Höflichkeit für Alt und Jung,' at Stuttgart; and in the Leipzig pocket-book Urania, 'Der Letzte Surillo,' a poem, said to be his best production of that class: in 1835, in Munich, the second volume of 'Novellen;' and in Lübeck, 'Kynalopekomachia, der Hundefuchstreit, mit Bildern von Specker' ('Dog and Fox Fight'), a satirical poem on the times. Erwin Specker was a young artist of Hamburg, much admired by Rumohr: he died in that year. [SPECKER, ERWIN.] In the same year also appeared the 'History of the Royal Collection of Prints at Copenhagen,' drawn up by Rumohr and the keeper of the collection, Professor Thiele; and at Leipzig, 'Contributions towards the History of Art and the greater completeness of the Works of Bartsch and Brulliot.' [BARTSCH, BRULLIOT.] In 1836 he published at Leipzig two works on wood-engraving, 'Hans Holbein der Jüngere in seinem Verhältniss zum Deutschen Formschnittwesen,' and an answer to a censure of this work, 'Auf Veranlassung und Erwidrung von Einwüfen eines Sachkundigen gegen die Schrift Hans Holbein,' &c. These were followed, in 1837, by a treatise, 'Zur Geschichte und Theorie der Formschnidekunst.'

In 1837 he made a fourth journey into Italy, but he did not go beyond Milan; and this tour was made rather with political views than as an artist. He published an account of his journey at Lübeck, in 1838, under the following title: 'Reise durch die östlichen Bundesstaaten in die Lombardei und zurück über die Schweiz und den oberrhein, in besonderer Beziehung auf Völkerkunde, Landbau, und Staatswirtschaft,' to which he published some additions in the following year—'Historische Beilage,' &c. He had previously published a work of the same kind on Tuscany, 'Ueber die Besitzlosigkeit der Colonen im Neuern Toscana, aus den Urkunden,' Hamburg, 1830. In 1841 however, after a fifth visit to Italy—to Venice—in the previous year, he returned to his more genial subject, the history of art, and published in Leipzig an inquiry into the invention attributed to Finiguerra of printing with engraved plates on damped paper—'Untersuchung, dass Maso di Finiguerra Erfinder des Handgriffs sey gestochene Metallplatten auf genetates Papier abzuzeichnen.' This was his last labour in the history of art, and his last poetical production of this class was, 'Raphaels Lehr-und-Wander-Jahre.'

In 1841 he purchased a house in Lübeck, intending to end his days there, and he fitted it up according to his own fancy. The winter of 1842 he spent in Berlin, and he was then attacked with water on the chest: he returned in the spring to Lübeck, where his physician recommended him to visit the baths in Bohemia; he accordingly set out, but being too ill to proceed, he remained at Dresden, where he died of apoplexy, July 25, 1843.

Rumohr's last literary production was a preface to 'Kampf Demokratischer und Aristokratischer Principien zu Anfang des sechszehnten Jahrhunderts,' Lübeck, 1843. It is a translation from three papers presented to him by Professor Altmeyer of Brussels. His 'Italienische Forschungen' will remain as a monument of his judgment and industry when probably nearly all his other works are forgotten. It is one of the best documentary works in the literature of art, and at the same time abounds in critical and theoretical reflections; it is likewise a work of great interest, though there may be different opinions about the correctness of Rumohr's theories. The two first volumes are upon modern art in Italy generally, from its origin to its decline in the 16th century, which is distributed under fourteen distinct heads; many errors in Vasari are corrected; much obscurity of the 12th, 13th, 14th, and 15th centuries is cleared up by authentic documents; and various false notions concerning the development of art are dissipated by critical reflections: the third volume is under two heads only, which treat chiefly of Raffaele and the architecture of the middle ages.

RUNCIMAN, ALEXANDER, an eminent Scotch painter, was born at Edinburgh in 1736. His father was an architect, and Runciman, who was brought up to the arts from his childhood, made coloured sketches in the fields as early as his twelfth year. At the age of fourteen he was placed in the studio of John and Robert Norris, John being considered in his day a famous landscape-painter. When only nineteen years of age he set up as an independent landscape-painter in Edinburgh; but he found, it seems, the people of Edinburgh, like those of many other places, lavish of their praises but very cautious in their purchases. This state of affairs continued for about five years, when in 1760 he took to historical painting; and though he had more ability for this line of art, his fortune seems to have been very little if at all improved. In 1766 he visited Italy, and at Rome made the acquaintance of Fuseli. Their tastes in art were very similar: both were absorbed by what is termed the sublime, and both were alike wild and extravagant in their execution. Runciman remained five years in Rome, and when he returned home he carried from Fuseli a letter of introduction to a friend, in which was the following passage: "I send this by the hands of Runciman, whom I am sure you will like: he is one of the best of us here."

He arrived at Edinburgh in 1771, a fortunate time for him, for Pavillion, the director of the new academy of the arts which had been established at Edinburgh in 1760, had very recently died, and Runciman was appointed to fill his place, with a salary of 120*l.* per annum, then a sufficient income in Scotland. He was further fortunate in finding two generous patrons in Sir J. Clerk, of Pennyquick, and Robert Alexander, an Edinburgh merchant. The former employed him on an extensive work at Pennyquick, suggested by himself—the decoration of the hall of that place with twelve great compositions from Macpherson's 'Ossian.' The subjects are—Ossian singing to Malvina; the Valour of Oscar; the Death of Oscar; the Death of Agandecca; the Hunting of Catholda; the Finding of Corban Cargloss; Golchossa mourning over Lamderg; Oina Morval; Cormac attacking the Spirit of the Waters; the Death of Cormac; Scandinavian Wizards making Incantations; and Fingal engaging the Spirit of Loda. The picture of Agandecca is reckoned the best; but as works of art they are extravagant in treatment and in composition, and incorrect in design. While engaged in this work, Runciman painted also 'The Ascension' on the ceiling over the altar of the episcopal chapel in the Cowgate of Edinburgh. He painted also King Lear; Andromeda; Nausicaa and her Nymphs surprised at the Water-Side by Ulysses; and Agrippina landing with the Ashes of Germanicus.

Runciman visited London in 1772, and exhibited some pictures there; but all that is remembered of him, says Allan Cunningham, is that he took up his quarters with the widow of Hogarth, who was in those days reduced to let lodgings for subsistence. Runciman died suddenly before his own door in West Nicholson-street, October 21, 1785, in his forty-ninth year. He had contracted an illness while painting the Pennyquick cupola, being forced to lie much on his back, and to this is attributed the shortness of his life.

Runciman's best works are his sketches; his faults are only multiplied in his pictures. The most offensive of his peculiarities of design is his huge length and uniformity of limb, the glaring defect also of the works of Fuseli; he was also invariably extravagant in his attitudes, and was conventional, mannered, and unnatural in his draperies. In execution he was least defective in his colouring, but in composition he was ever ready, and his invention was bold and fertile. There are a few etchings by him from his own designs: the best is considered to be 'Sigismunda weeping over the Heart of Tancred.' He is said to have been lively and agreeable in conversation: Hume, Robertson, Lord Kames, and Monboddo were among his associates.

\*RUNEBERG, JOHAN LUDVIG, the most popular living poet in the Swedish language, has never been in Sweden. He was born on the 5th of February 1804, at Jakobstad in Finland, one of a numerous family which his father, a sea-captain in poor circumstances, found a difficulty in bringing up. Johan was sent to an uncle, a toll-collector, at Uleaborg, where he heard so much on all sides of Franzén [FRANZÉN] the Swedish poet, who was born there, that he was early led to form a high notion of poetic fame. The death of his uncle returned him on his father's hands at Jakobstad, and it was only by a subscription of friends and neighbours that an opportunity was

obtained of sending him to the school of Gamla Carleby. In 1822 he studied at the University of Abo, he took his degree in 1827, and in 1830 he became teacher of *Æsthetics* at Helsingfors, to which place the university had been transferred after the destruction of Abo by fire. In 1837 he removed to the Gymnasium, or grammar-school, of Borgo, in a somewhat similar capacity, and in 1842 he became the teacher of Greek at Borgo, a post which we believe he still retains, with, since 1844, the title of 'Professor.' Professor Runeberg, like Professor Wilson of Edinburgh, is of tall stature and athletic make, and fond of field sports; he is considered the best fisherman as well as the best poet in Finland.

The literary position of Finland is very singular. Up to the year 1809, in which the 'Great Principality,' as it is called, belonged to Sweden, it somewhat resembled that of Wales—the Finnish language, like the Welsh, being that of the lower, the Swedish, like the English, of the upper and educated classes. The conquest of Finland by Russia in 1809 transferred the political allegiance of the Finlanders from Stockholm to St. Petersburg, and since that event there has been a marked revival of the cultivation of the Finnish language, as well as an introduction to a certain extent of the Russian; but Swedish still remains in Finland the main language of science, of learning, and of literature, its empire being shared however with Latin in the first two cases, and with Finnish in the last. Franzén, after the conquest, removed to Sweden, and spent the rest of his life there; Runeberg, who has never been to Sweden, writes in Swedish only, and we have seen it stated in a Swedish magazine that he is unable to hold a conversation in Finnish.

Runeberg's first poems appeared in 1830, and a collective edition of them which was published at Örebro in 1851-52, occupies three volumes. The first volume comprises 'Elgskyttearne,' ('The Elk-shooters') in nine cantos, 'Hanna,' in three cantos, and 'Nadeschda,' in nine, three narrative poems, or tales in verse. The two first of these tales, which are in hexameters, are of the same description as Voss's 'Luise' in German, delineations of daily life, such as in English literature have hitherto been successful only in prose—a something resembling the 'Vicar of Wakefield' or 'Cranford' in hexameters. Such poems have an ethnological as well as a poetical value, throwing a strong light on the peculiar manners and customs of the country they portray. As a tale 'Nadeschda' is considered more successful than the others; but, in this, the poet places his scene in Russia, and the interest lies more in the narrative. The second volume commences with the most original of Runeberg's poems, 'Fänrik Ståls Sägner,' ('The Stories of Ensign Stål'), in which he tells in a singularly original and striking manner and in a vein of the most fervent patriotism, a number of anecdotes of the conquest of Finland in 1809, and the brave defence of the Finlanders against the Russians when abandoned to their own resources by the imbecility of Gustavus IV. of Sweden. The introduction, in which the poet gives an account of his becoming acquainted when a student with the old ensign from whom he had the tales, is translated in verse in the 'History of Scandinavian Literature' by the Howitts; but, though the translation is on the whole a good one, it is singular to remark how invariably some of the spirit of the original is lost in every stanza. The other works of Runeberg were originally published at Helsingfors or Borgo; this first appeared at Stockholm in 1849, and we do not observe that a promised continuation has appeared, or that the book has been reprinted in Finland, where the Russian authorities, which in 1841 assigned a yearly pension of one thousand rubles to the poet from the Finnish finances, must have been not a little startled at the tone and tendency of his outburst. The rest of Runeberg's compositions are of a shorter kind, comprising several amatory poems, and idyls of remarkable beauty and tenderness, and a number of translations, including 'Chevy Chase,' and many Servian ballads, all of which however Runeberg has transferred, not from the originals, but from German versions. Many of these shorter poems are well rendered in Howitt, and in an article in 'Household Words;' the general character of the whole is very pleasing, and there are probably few living foreign poets whose works would be more likely to become popular in English. The last production of Runeberg is a volume entitled 'Smärre Berättelser' ('Short Narratives'), published at Helsingfors in 1854. King Oscar of Sweden named him in 1844 a knight of the order of the North Star, and Runeberg received on one occasion the award of a poetical prize from the Swedish Academy. Nearly all of his works have been translated into German.

RUNJEET SINGH, MAHA RAJAH, chief of Lahore and Cashmere, and the founder of the Sikh empire, was born at Gugaránwála, sixty miles west of Lahore, on the 2nd of November 1780. The natural interest attached to an energetic man, who ruled almost without opposition for forty years over so many turbulent provinces, has induced diligent inquiries to retrace the Maha Rajah's descent, for more than two centuries. But his real history begins with his bold and enterprising grandfather, Chhurruth Singh, who from a low condition and a vagrant life, became master or sirdar of Sookur Chukea, in the Punjab. The son of Chhurruth, Maha Singh, extended his power, and though he died before he was thirty, he had carried on a species of warfare with his neighbours for about fourteen years, commanding at one time, it is said, 60,000 horsemen. He captured Rusoolgur, in 1780, and his son and successor being born about the same time, Maha

Singh gave him the name of Ranjeet, or Runjeet, signifying the "field of battle." When Maha Singh died in 1792, his son was still in his twelfth year.

During Runjeet's minority, his mother, who was still young and handsome, was intrusted with the government of the missul, conjointly with the youthful Sirdar. She appears to have been a woman of very irregular life, and whilst she shared her authority with her paramour Lukput Singh, she sought by the most vicious allurements to corrupt her son, that he might be rendered unfit to discharge his duties, when he had grown up. She succeeded in corrupting the mind of her son, but not in her chief object. As he grew up he showed a strong disinclination to remain in a subordinate position, and his known feelings gave rise to reports on his mother's sudden death in 1797 that she had been poisoned by his direction. Runjeet was then seventeen, and from that time he gave unrestrained vent to his ambition and love of power. He began to extend his possessions by quarrelling and making war with his more inert and weaker neighbours; or by lending his band of followers as an auxiliary force to some powerful ruler. The great province of Lahore was bestowed upon him in 1799 by Sunam, shah of Afghanistan, for the services he had rendered that prince in a military expedition.

Soon after, Runjeet commenced his long series of conquest. Sealkote was taken; Delawurgur surrendered; Nuoshuhur and Pindecputtean fell into his hands; and after a siege of two months, the fort of Bund submitted to his arms. Many places of less note were captured within the first five years of the century. In 1806, he took the strong fort of Loodianah; in 1807 he got possession of Kussoor by stratagem, for his cunning was equal if not superior to his prowess; in the same year he captured and pillaged Moulton for the first time; but relinquished the place on payment of 70,000 rupees. In October 1808, Runjeet Singh marched his army through the Bist, crossed the Sutlej, and seized the cities of Jagram and Rhaekakote. In the course of his progress, he exacted tributes from all the Sirdars of the Doab.

Surrounded by Oriental princes, inert, effeminate, fond of repose, he had already acquired a large dominion in 1809, at the age of twenty-nine. Then as he drew nearer the British possessions, finding himself confronted by opponents of a different character, over whom neither his courage nor his craft could be availing, he submitted with a good grace to the necessity of his position. During the same year (1809), Mr. Metcalfe arrived at Umritsir, having been despatched from Delhi, as the British envoy to Runjeet Singh, with instructions to negotiate a treaty. Mr. Metcalfe remained two months with the Maha Rajah. In the early part of his sojourn, whilst his band of 500 sepoys were occupied in pitching their tents, the Ukalees collected to the number of 3000, and attempted to drive off the escort of the British envoy. A skirmish ensued in which the sepoys succeeded without much difficulty in dispersing their opponents, though six times as numerous as themselves. Runjeet, who had watched the affair, complimented the envoy on the bravery and discipline of his soldiers. This little incident made a deep impression on his mind, and first suggested that adoption of the arms and discipline of more civilised nations, by which Runjeet afterwards raised his power to so great a height. He now treated the British envoy with marked attention, presented him with a dress of honour of costly materials, and concluded a treaty with him, whereby he undertook "to preserve peace and amity with the British; not to keep more troops on the left bank of the Sutlej than were necessary for preserving his territories: and to abstain from making further inroads on the Sikh chiefs." This important treaty having been concluded, April 25, 1809, was faithfully observed by Runjeet until the day of his death, upwards of thirty years after.

Immediately after this negotiation with the British, Runjeet resumed his military aggressions. He captured Kote Kangra and other places in 1809. In 1810 he became master of Goojerat, then of Kooshah, then besieged and pillaged Moulton a second time. In 1811 the whole of the Nukce country between Moulton and Manju was annexed to his possessions. In 1812, Koollou and Sookhet, and afterwards Mandhee, were attacked, the rajahs of which all became tributaries of Lahore. It was in this year that Runjeet, having been applied to by Futteh Khan to assist him with troops in his invasion of Cashmere, got possession, by very artful means, of the great diamond, the famous Koh-i-noor, now the property of the English crown. In 1814 Runjeet determined to effect the conquest of Cashmere, but a violent snow-storm discouraged his soldiers, who were put to flight and dispersed. Undismayed by this reverse, he besieged and took Noorpoor in 1815, and then Rajour, which the Sikhs first pillaged, then burned to the ground.

Moulton was captured for the third time in 1817, and retained; the following year Peshawur fell into his hands. Finally, in 1819, he captured the rich city of Cashmere, and annexed the whole province to his dominions. In consequence of this addition to his dominions, he assumed the title of Maha Rajah (king of kings).

In the course of 1822, the growing fame of Runjeet, and his well-known partiality to foreigners, induced two European officers of merit, Messrs. Allard and Ventura, to visit the Punjab. Having met with a flattering reception from the Maha Rajah, they agreed to enter his service at a fixed salary of 50,000 rupees, and to introduce a general system of reform into the Sikh army. It was chiefly to the exertions

of these gentlemen, and M. Court, who afterwards joined them, that Runjeet's celebrated army of Sikhs owed its high state of discipline. Ahmed Shah, a pretended reformer, fomented a petty rebellion in the Punjab in 1827; but Runjeet, having taken the field against him, defeated him soon after. This was the only revolt against his authority which is mentioned in the annals of his long rule.

In October 1831, Lord William Bentinck, governor-general of India, had a meeting with Runjeet Singh at Roopur, which was attended on both sides with great pomp and ceremony. On this occasion a new treaty was signed by the Maha Rajah and the governor-general. The life of Runjeet, in spite of his active occupations, had always been blemished by excesses and low indulgence; his health had in consequence already been seriously affected. At fifty he was completely broken down by premature old age. During the last few years of his life he was disabled by palsy and other bodily ailments, and could not stand without assistance. In 1836 his army was totally defeated by the Afghans; but, in spite of this and other reverses, he retained to the last his authority over his subjects. He died on the 27th of June 1839, at the age of fifty-nine, shortly before the capture of Ghuznee. After his demise, the treasure he had hoarded was estimated at 8,000,000 sterling, besides jewels, shawls, horses, elephants, &c., valued at some millions more. It is said that no less than 1300 rich bridles, ornamented with gold and silver, were found in the royal treasury. After his death, his four wives and seven female slaves were, according to the barbarous usage of his people, permitted to burn themselves along with him.

RUPERT, PRINCE ROBERT, of Bavaria, better known by the title of Prince Rupert, was born in 1619. His mother, Elizabeth, the eldest daughter of James I. of England, married Frederic V., elector palatine, who was banished and deprived of his estates in consequence of his unsuccessful attempt to seat himself upon the throne of Bohemia. Rupert, an exile from his youth, received little education; his disposition was active; he had a taste for military pursuits, and as the civil wars in England presented an opportunity for employment, he offered his services to Charles I., who put him in command of a regiment of cavalry. He took Cirencester, Hereford, and Lichfield, and was engaged in the battles of Worcester, Edgehill, and Chalgrove Field; but he was remarkable rather for his rash courage and impetuosity than for prudence or military knowledge. His resolute vigour however compensated in part for his want of judgment as a leader, and the king continued to employ him, endeavouring to insure a continuance of his services by creating him a Knight of the Garter and Duke of Cumberland. He took Bristol, dispersed the parliamentary army at Newark, and was afterwards successful in the north; but at Marston Moor his indiscretion ruined the king's hopes: his want of concert with the Marquis of Newcastle and the hasty withdrawal of his troops from the field of battle are gravely censured by Lord Clarendon. Had Prince Rupert "stayed with the army he marched away with, at any reasonable distance, it would have been long before the jealousies and breaches which were between the English and Scotch armies, would have been enough composed to have agreed upon the renewing the siege." As it was, in two days after the battle they returned to the posts they had occupied before it took place. ('Hist. Rebel,' vol. iv., 512.) The king's confidence in him however did not diminish: on the contrary, Rupert, who had been commander only of the horse, was soon after appointed general of all the king's forces, with which he forced Sir Robert Pye to surrender Leicester, after a gallant defence. He gave the first charge in the battle of Naseby, and repulsed the troops with which he was engaged, but here again his rash pursuit of that portion of the parliamentary forces which he had defeated, while the main portion of their army under Cromwell remained on the field, gave the victory to his opponents. After the day was lost, he accompanied the king and some remnant of their forces to Hereford, the king hoping to join Gerrard, who had a body of royalist troops in South Wales, and thus to muster a new army. At Hereford, before it was agreed what should be done next, Rupert left the king, and went hastily to Bristol that he might put that city in condition to resist an attack, which there was reason to expect would soon be made upon it. The reverses that the king had lately sustained rendered his continuing in possession of Bristol a point of the most vital consequence. Rupert wrote so confidently of his operations, that the king marched to Chepstow with the intention of joining him. He was dissuaded however; fortunately, as it proved, for after a short defence, Rupert surrendered the city to the parliamentary army. This pusillanimity justly disappointed and irritated the king, who signified his pleasure to the lords of the council that they should require Prince Rupert to deliver his commission into their hands. He likewise wrote the following letter to him, depriving him of his command:—

"Nephew,—Though the loss of Bristol be a great blow to me, yet your surrendering it as you did is of so much affliction to me, that it makes me not only forget the consideration of that place, but is likewise the greatest trial of my constancy that hath yet befallen me; for what is to be done, after one that is so near me as you are, both in blood and friendship, submits himself to so mean an action? (I give it the easiest term) such—I have so much to say, that I will say no more of it: only, lest rashness of judgment be laid to my charge, I must remember you of your letter of the 12th of August,

whereby you assured me that, if no mutiny happened, you would keep Bristol for four months. Did you keep it four days? Was there anything like a mutiny? More questions might be asked; but now, I confess, to little purpose: my conclusion is to desire you to seek your subsistence, until it shall please God to determine of my condition, somewhere beyond the seas; to which end I send you herewith a pass; and I pray God to make you sensible of your present condition, and give you means to redeem what you have lost; for I shall have no greater joy in a victory than a just occasion, without blushing, to assure you of my being your loving uncle and most faithful friend, C. R.

"Hereford, September 1645."

(Clarendon, 'State Papers,' and Oxford edit. of Clarendon's 'Hist. Rebell.')

Rupert rendered an account of his conduct before the king at Belvoir Castle, and removed the imputation of disloyalty and treason, but not that of indiscretion. He was unpopular throughout the country, and had the misfortune, says Lord Clarendon, "to be no better beloved by the king's party than he was by the parliament." He did not resume his military command; nevertheless the king could not long do without him. He sought the appointment of commander of that portion of the fleet which still adhered to the king, and as there was no other person to whom the king could readily confide the charge, Rupert obtained the post (1648). His services were immediately required on the Irish coast. Lord Ormond and the Royalist party in Ireland needed assistance, and Rupert, in order to give them aid, anchored in the harbour of Kinsale. Here Blake, with the Parliamentary squadron, blockaded him until (October 1649) he resolved to force his way out, which he did, with the loss of two or three ships, and steered for Lisbon. He was pursued by Blake, who demanded the surrender of his fleet in the name of the Commonwealth, but the king of Portugal, who was in alliance with Charles I., not only protected the king's fleet, but fitted out a squadron to assist Prince Rupert, and so induced Blake to withdraw his fleet.

Rupert now sailed to Carthage, and again Blake pursued him, and requested that the prince's ships might be given up to him, but the king of Spain, being in amity with England, a refusal was given on similar grounds to those alleged by the king of Portugal. From Carthage he sailed to Malaga, where he was so ill-advised as to sink and capture some English merchantmen. Informed of this transaction, Blake immediately followed him, and in January 1651 attacked Rupert's squadron, without reference to the Spanish authorities, burnt and destroyed all but four or five ships, with which the prince escaped to the West Indies, where he supported himself by capturing English and Spanish merchantmen. Prince Maurice, who accompanied his brother, was cast away, and Rupert contrived with two or three ships to return to France, where he sold them, on behalf of Charles II., to the French government.

On the restoration of Charles II., Rupert left France and returned to England, where he was made a privy councillor, and received other honours. By this time the impetuosity of his youth had diminished, and he judged with more consideration and calmness. When therefore there was a commencement of hostilities with the Dutch, the appointment of Rupert to serve under the Duke of York was looked on without dissatisfaction. During the expedition he acquitted himself with credit, which was in no way diminished when in the following year he commanded the British fleet in conjunction with Lord Albemarle. In 1673 he was again charged with the command of the fleet, which was actively engaged with the Dutch; but he found this squadron so ill-equipped, and, what was worse, so weakly manned, that he returned home. The king expressed some coolness at the manner in which he conducted some of his latter engagements. He had now finished the active part of his life; he was governor of Windsor Castle, and there spent a great portion of his time, occupied for the most part with mechanical and chemical experiments, with painting and engraving; in the latter art he was an adept, though not the inventor of mezzotint, as has often been erroneously stated. He died at his house at Spring gardens on the 29th of November 1682. His collection of pictures was sold after his death, and his jewels, which were of considerable value. He had illegitimate children, but was never married.

Rupert was endowed with good natural abilities, had a quick perception, was vigorous, active, and energetic; he could readily change employments and pursuits, acquiring quickly such a knowledge of that which he undertook as to prevent miscarriage. He was impetuous, rash, impatient of control and advice, and wanting in most qualities which constitute a great man. His conduct with the king's troops in Yorkshire, at Marston Moor, and at Bristol, and his piracies in the West Indies, have been very justly censured.

RUSH, BENJAMIN, was born in the neighbourhood of Philadelphia in December 1745. His ancestors had followed William Penn to America in 1683. His father and his grandfather each combined the business of a farm with the occupation of a gunsmith. Losing his father early, he was indebted to the care of an excellent mother for his early education; and he passed five years in the grammar-school of his maternal uncle, the Rev. Dr. Finley, afterwards president of the college of Princeton, to which college Rush was removed at the age of fourteen. Here he became distinguished by his application, his acquirements, and the possession of a fluency of expression for which he was ever after remarkable. At fifteen he obtained the degree of bachelor of arts, and

commenced his medical education with Dr. Redman, then an eminent practitioner in Philadelphia. His early attachment to the writings of Hippocrates, as well as his classical acquirements, were evinced, when he was only seventeen, by his translating the Aphorisms from the Greek into English—a task which Dr. Hosack, one of his biographers, justly supposes to have influenced the habits of his mind and the character of his subsequent writings. Even at this early period his diligence and method were such, that his notes of the yellow-fever at that time prevalent in Philadelphia contain records of considerable value. At the age of twenty-one he repaired to Europe, and studied two years at Edinburgh, where Monro, Gregory, Cullen, and Black then held chairs. His inaugural dissertation, on taking his degree in 1768, is entitled 'De Coctione Ciborum in Ventriculo,' and contains an account of several experiments made on himself, and some by a fellow-student, to prove the acid changes undergone by the food in the process of digestion.

After passing some time in attendance on the London hospitals and lectures, and paying a visit to Paris, Dr. Rush returned to Philadelphia in the spring of 1769, and commenced the practice of physic, for which he appears to have been eminently qualified, not only by the liberal plan of his previous studies, but by his gentleness of disposition and by great humanity. His punctual industry was such, that he is said never to have omitted his duties at the hospital, or those of his private practice, even for a single day, except in the case of illness; and it is added that his love of order was exemplified by his never being ten minutes behind the time when he was expected. He was very soon elected professor of chemistry, and in 1789 he succeeded Dr. Morgan in the chair of the theory and practice of physic. The College of Philadelphia and the University of Pennsylvania becoming united in 1791, he was appointed professor of the institutes of medicine and clinical practice; and from the year 1805 to the end of his life he held the united chairs of the theory and practice of medicine and of clinical practice. His popularity as a lecturer was evinced by the number and the attachment of his pupils, and the celebrity which his reputation mainly imparted to the medical school of Philadelphia. At a late period of his life he still warmly expressed the pleasure he had derived from "studying, teaching, and practising medicine;" but the times in which he lived were too full of events to permit him to pay that undivided attention to medical science which he subsequently regretted had ever been impeded by public events. In the Congress of 1776 he held a seat as a representative of the state of Pennsylvania, and he subscribed the declaration of independence. He was appointed physician-general of the military hospital of the middle department in 1777, and chosen a member of the state convention for the adoption of the federal constitution ten years afterwards. A few years later, in 1794, he describes himself as having "lately become a mere spectator of all public events;" from which period he seems to have devoted himself almost exclusively to medical studies and pursuits: he held however the office of treasurer of the United States Mint during the last fourteen years of his life. On different occasions he received medals from the King of Prussia and the Queen of Etruria, for information communicated to them in answer to inquiries concerning the yellow-fever; and in 1811 the Emperor of Russia sent him a diamond ring as a testimony of respect for his medical character. His useful life was terminated, after a short illness, on the 19th of April 1813.

The character of Dr. Rush exhibits a combination of nearly every quality appropriate to a physician; industry, temperance, benevolence, uprightness, public independence, piety, were in him united with learning and general knowledge, and a profound acquaintance with almost every branch of medical science. By habits of early rising, and a wise economy of time, he was enabled, in the midst of arduous and continual duties, to treasure up and to communicate a variety of observations peculiarly stamped with utility; and all his exertions were animated by a philanthropy which caused him to devote one-seventh of his receipts to purposes of charity, and dictated his memorable last injunction to his son, "Be indulgent to the poor." In the year 1793, when Philadelphia was ravaged to an unexampled extent by the yellow-fever, his services were so much in request that his exertions nearly cost him his life. His house was filled at all hours with applicants for relief, and his carriage beset in the streets. He married in 1776 Miss Julia Stockton, daughter of Judge Stockton, who is described as a lady of amiable disposition and cultivated mind. Dr. Rush was survived by nine of thirteen children, the fruits of this marriage.

The number of Dr. Rush's works is considerable; they include a history of the yellow-fever as it appeared in Philadelphia in 1793; and of other epidemics of different years. One of his latest works was a 'Treatise upon the Diseases of the Mind.' His last was a letter to Dr. Hosack on the subject of hydrophobia, which terrible disease he considered to be principally seated in the blood-vessels. In 1787 he published an 'Inquiry into the Effects of Public Punishments upon Criminals and upon Society,' to which the mitigation of the Pennsylvanian code is attributed. He also edited the works of Sydenham, Clegghorn, Pringle, and Hillary.

The principal papers published at various times by Dr. Rush are collected and comprised in two volumes of 'Medical Inquiries and Observations.' The first of these was published at Philadelphia in 1788; the second in 1793. Of these volumes, four editions appear to

have been published in four years. Their contents consist of about thirty separate essays, all on subjects of medical interest; each distinguished by the philosophical character of the author, and not a few interesting to general readers, to moralists, and to statesmen. The essays 'On the State of Medicine among the Indians,' 'On the Influence of the Military and Political Events of the American Revolution upon the Human Body,' 'On the Influence of Physical Causes upon the Moral Faculty,' and 'On the State of the Mind and Body in Old Age,' are strongly indicative of the observing and reflecting habits of the author. The account of the climate of Pennsylvania presents a model of medical topography, a subject at that time little cultivated. Several of the essays on separate diseases, as the *Scarlatina Anginosa*, the *Cholera* of Infants, the *Influenza*, &c., are distinguished by accuracy of remark and a well-exercised judgment. The essay 'On the Effects of Spirituous Liquors on the Human Body,' contains the strongest original arguments that could be employed by the most zealous advocate of temperance; and in the 'Inquiry concerning the Causes and Cure of Consumption' we recognise the doctrine of the general or constitutional origin of that fatal disorder, subsequently supported by Dr. Beddoes, but more distinctly and ably illustrated by Sir James Clark. The celebrated doctrine so often and so eloquently expounded by the late Mr. Abernethy, of the 'Constitutional Origin of many Local Diseases,' is very perspicuously announced in Dr. Rush's 'Inquiry into the Causes and Cure of Sore Legs.'

RUSHWORTH, JOHN, is said by Anthony Wood to have been born in Northumberland about 1607, of a good family, and to have studied for a short time at Oxford, where however he did not remain long enough to be matriculated. Coming up to London, he entered himself of Lincoln's Inn, and was called to the bar; but it does not appear that he ever practised. So early at least as the year 1630, he began, according to his own account (in the preface to the first volume of his 'Historical Collections') to attend in the Star Chamber, the Court of Honour, the Exchequer Chamber, the council, and other places, whenever any matter of importance was in question, and to take notes of the proceedings; and in this way his time seems to have been wholly occupied. When the first parliament of 1640 assembled, he eagerly embraced the opportunity of being present at the debates and conferences of the two houses; and after its dissolution he proceeded to the north, the scene of the Scottish invasion, where he witnessed the fight of Newburn, and afterwards found admission to the meetings of the great council at York and of the commissioners at Ripon. When the Long Parliament met, in November, Rushworth was appointed assistant to Henry Elsynge, Esq., clerk to the house of commons; and by the opportunities which he enjoyed in this situation, he was enabled to make ample collections relating to all the most interesting public transactions of the time. It appears to have been his practice to take down in a species of short-hand whatever was said in the house which he thought worth preserving. Thus, he tells us himself, that on the evening of the day on which the king made his attempt to seize the five members, "his majesty sent for Mr. Rushworth, the clerk, whom he observed to take his speech in characters, requiring a copy of it; who pleaded in excuse how Mr. Neville was committed to the Tower for telling his majesty what was spoken in the house; he smartly replied, 'I ask you not to tell me what was said by any member, but what I said myself,' upon which a copy being transcribed, it came out in print next morning, by the king's order."

But besides his services as clerk and reporter, after the king had left London, Rushworth (being, it would appear, a good horseman) was the person usually employed to carry addresses and other communications from the house to his majesty; and Wood records that on those occasions he was wont to perform the journey to York in twenty-four hours. At a somewhat later date he appears to have been in like manner entrusted to convey the messages of the house to their general, Essex. On the 14th of June 1643, the house ordered "That the mare and young horse belonging to Mr. Endymion Porter, lately brought up from Enfield to London, be forthwith delivered to Mr. John Rushworth, to be employed in the service of the parliament in sending messages between this house and the Lord-General." On a subsequent day it was further resolved that he should be recommended to the committee of the house for excise, and to the treasurers and commissioners, to be employed in some office or place suitable to his condition and the recommendation of the house, "towards a recompense of the several services he hath done for the kingdom." It is not known however that he derived any substantial benefit from this vote.

In 1643 he took the covenant with most of his party. In 1645, when the command of the parliamentary forces was given to Sir Thomas Fairfax, who was his near relation, Rushworth was appointed his secretary; and from this time he was principally with the army, till Fairfax's resignation of his command in 1650. Being at Oxford in Fairfax's suite in 1649, he received from the university the degree of M.A. Having returned to London and taken up his residence in Lincoln's Inn, he was, in 1652, appointed one of the committee for the reform of the common law. The next time we hear of him is as one of the members for Berwick in Cromwell's last parliament, which met in January 1653; and he again sat for the same borough in that which restored Charles II., in April 1660. The overthrow of the

Protectorate however was fatal to Rushworth's rising fortunes. We have seen the zeal with which he served the republican party; and there can be no doubt that this was the side to which he was heart and soul attached; he had submitted the first volume of his 'Historical Collections,' in manuscript, to Oliver Cromwell; and when it appeared in print it was ushered in by a dedication in very high-flown terms to the new Protector Richard. When the king came back, Rushworth withdrew this unlucky dedication; and he also made a modest attempt to conciliate Charles by presenting to him some registers of the Privy Council which had fallen into his hands. Thanks were formally returned to him in the king's name for the books, but he received no encouragement to expect any further evidence of the royal favour.

Rushworth had not, like many of his party, taken advantage of his opportunities and of the appointments he had held, to secure a fortune to himself out of the misfortunes of his country, and he was now probably in rather straitened circumstances. When Sir Orlando Bridgeman was made lord keeper however, in 1677, he appointed Rushworth his secretary; and we find him sitting again for Berwick, both in the parliament which met in March 1679, and also in that which met at Oxford in 1681. But after this, it is stated, he lived in retirement and obscurity; till, in 1684, he was arrested for debt and sent to the King's Bench prison, where he remained till he died, on the 12th of May 1690. He had latterly taken to drinking to drown care, and his mind and memory were nearly gone for some time before he died. Rushworth left several daughters, "virtuous women," says Anthony Wood, "of which one was married to Sir Franc. Vane, of the North."

The first part, in one volume folio, of Rushworth's 'Historical Collections of Private Passages of State, Weighty Matters in Law, and Remarkable Proceedings in Parliament,' embraces the space from 1618 to 1629, and was published in 1659. It was reprinted clandestinely in 1675, and also again in 1682. Part second, in two volumes, extending from 1629 to 1640, appeared in 1680; and that same year Rushworth also published, in one volume folio, his account of the 'Trial of the Earl of Strafford,' which is now considered as forming the eighth volume of his 'Historical Collections.' The remaining parts of that work were left ready for the press at his death; and part third, in two volumes, extending from 1640 to 1645, appeared in 1692; part fourth, also in two volumes, and coming down to 1648, in 1701. All the seven volumes, together with Strafford's Trial, were reprinted in 1721. Rushworth's intention, as he states in the preface to his second volume, had been to bring down the work to the dissolution of the Long Parliament in 1653.

Of the importance of this active and industrious compiler's labours, and of the value of what he has bequeathed to us, there can be no doubt. His collection contains an immense number of papers and notices now nowhere else to be found, and many which never were to be found elsewhere. And it may also be admitted that the promise of perfect impartiality with which he sets out, is upon the whole as well kept as we have any right to expect that it should be. The book however was loudly cried out against for its unfairness, its positive falsehoods and inventions, as well as its omissions and suppressions, by the high church and Tory party on the appearance of the first volume. An elaborate exposition of the grounds of these charges (which however are very unsatisfactorily made out after all) may be found in the long introduction to Nelson's 'Impartial Collection of the Great Affairs of State from the beginning of the Scotch Rebellion in the year 1639;' which indeed was professedly published "by his majesty's special command," in opposition to Rushworth's work, but of which, although it was intended to come down to the death of Charles I., no more than two volumes ever appeared, the first in 1682, the second in 1683, carrying the history no farther than to January 1642.

\* RUSKIN, JOHN, was born about the beginning of 1819. He says, "I was born in London, and accustomed for two or three years to no other prospect than that of the brick walls over the way; had no brothers nor sisters, nor companions." His father was a wealthy merchant, and he enjoyed, he tells us, "an early life of more travelling than is usually indulged to a child." To this city birth and early journeying he ascribes his intense love of the grandeur of natural scenery; "though I could always make myself happy in a quiet way, the beauty of the mountains had an additional charm of change and adventure which a country-bred child would not have felt." . . . . . "The first thing which I remember, as an event in life, was being taken by my nurse to the brow of Friar's Crag on Derwentwater; the intense joy, mingled with awe, that I had in looking through the hollows in the mossy roots over the crag into the dark lake, has associated itself more or less with all twining roots of trees ever since. . . . . These feelings [of 'awe and heart hunger' in the presence of mountains] remained in their full intensity till I was eighteen or twenty, and then, as the reflective and practical power increased, and the 'cares of this world' gained upon me, faded gradually away." . . . . . But there remained "the gift of taking pleasure in landscape, which I assuredly possess in a greater degree than most men; it having been the ruling passion of my life, and the reason for the choice of its field of labour." ('Modern Painters,' v. iii., ch. 17.)

Mr. Ruskin's academic education was completed at Oxford, where

he was a gentleman-commoner of Christchurch. He carried off the Newdigate prize in 1839 (for an English poem, 'Salsette and Elephantia'), and graduated double fourth class in 1842. He had however given more attention to the study of art than to either letters or mathematics, and he had been assisted in his studies by some of the best water-colour painters of the day. Prout, Copley Fielding, and Harding are mentioned as his teachers in landscape-painting, and he had tested his acquirements in continental travel. But his admiration had chiefly centred on Turner, and, conceiving that the merits of that great painter were overlooked or misrepresented by certain critics, he commenced writing a letter to the editor of a review, "reprobating the matter and style of those critiques, and pointing out their perilous tendency." The letter however soon grew into a something which its author "scarcely knew whether to announce as an essay on landscape-painting, . . . or as a critique on particular works," and which his readers have scarcely yet made up their minds how accurately to specify. Eventually the first volume appeared, as a modest octavo, in 1843, with the title of 'Modern Painters: their Superiority in the Art of Landscape-Painting to all the Ancient Masters. By a Graduate of Oxford.' The work took the public completely by surprise. Such a bold denunciation, not only of all those whom the art-critics of all countries had agreed to call 'the great masters' of landscape-painting—of (to use the author's words) "Claude, Gaspar Poussin, Salvator Rosa, Cuyp, Berghem, Both, Ruysdael, Hobbima, Teniers (in his landscapes), Paul Potter, Canaletti, and the various Van-somethings and Back-somethings, more especially and malignantly those who have libelled the sea,"—but even of all the modern landscape-painters of France and Germany, might well startle the sober reader, though the author declared his demonstrations to be similar in strength to those of Euclid, and deemed it "proper for the public to know, that the writer is no mere theorist, but has been devoted from his youth to the laborious study of practical art." A work so pompously heralded, and in itself so paradoxical, though it might have secured a brief popularity and afforded a little temporary amusement, must soon have sunk under the attacks of adverse criticism, had it not possessed sterling excellences. And it was seen, when fairly examined, that it was a work of no ordinary stamp. Amidst an affluence of words unparalleled probably by any prose writer since Jeremy Taylor, there was apparent original descriptive genius that would have insured vitality to a poem; an artistic eye for form and colour such as few English writers on art had possessed; very considerable acquaintance alike with pictures and the less known aspects of natural scenery; striking powers of observation and reflection; and an earnestness bordering on enthusiasm which gave life and reality to every page. The work made its way and secured its position. In 1846 a third edition (like the second, greatly enlarged and altered) appeared, and it was accompanied by a second volume, treating 'Of the Imaginative and Theoretic Faculties.' 'The Superiority of Modern Painters' was now dropped out of the title, and the size was changed to an imperial octavo: it now in fact assumed to be an elaborate treatise on landscape-painting in its principles and developments. An interval of ten years elapsed before the third and fourth volumes ('Of Many Things,' and 'Of Mountain Beauty') appeared, in 1856. These two volumes were much bulkier than the preceding ones, and illustrated with engravings. A fifth volume is announced as in preparation, and it will probably end the work, though in the third volume Mr. Ruskin prudently announced, in apologising for not having completed the work in the limits first proposed, that "having of late found his designs always requiring enlargement in process of execution, he will take care, in future, to set no limits whatsoever to any good intentions."

It is a curious illustration of the extent to which this "enlargement of his designs" may proceed "in the process of execution," that what was originally intended as a letter to the editor of a review, although still unfinished, has already expanded into by far the longest dissertation on art in the English language. And this points at what has prevented Mr. Ruskin taking the high place as an authority on art to which he else might fairly have aspired. He appears never to think out his subject before he writes upon it. Very much of his philosophy, of his criticism, and of his invective (and whilst one of the greatest masters of diffuse writing he is one of the strongest in condensed invective), is plainly the result of merely present feeling, and consequently involves him in all kinds of difficulties and inconsistencies, which much of his future time and temper is consumed in reconciling, denying, or explaining away. He is in fact one of the most impulsive of writers, whilst he also claims to be one of the most inflexible. Hence he turns aside to settle every subject that happens to come under notice in the course of his investigation (from the principles of Christianity, and the emptiness of German philosophy, down to Gil Blas's immorality, the worthlessness of railways for the conversion of the heathen, and the vanity of ladies' dresses) instead of concentrating his powers on the task that lies before him; and thus we have in 'Modern Painters' the most diffuse and in many respects most misleading, where we might have had the most important as well as the most brilliant work of its kind in modern literature. It is in every way to be lamented, for of the brilliancy of Mr. Ruskin's powers, and the depth and subtlety of his feeling for art, there can be little question, while he has undoubtedly pursued it with singular diligence,

and in a way that would of course have been impossible to one possessed of less leisure or more limited means. He says himself in the Preface to the third volume of 'Modern Painters,' "I have now given ten years of my life to the single purpose of enabling myself to judge rightly of art, and spent them in labour as earnest and continuous as men usually undertake to gain position, or accumulate fortune. . . I have given up so much of life to this object; earnestly desiring to ascertain, and be able to teach, the truth respecting art."

These ten years had been diligently occupied. During them he had made repeated and prolonged visits to the Alps, and to the cities of Italy—especially Venice. Even his literary labour had been by no means confined to the preparation of the remaining volumes of his 'Modern Painters;' on the contrary his pen had ranged over a very wide field, and produced works that in mere extent would have done credit to the industry of a tolerably assiduous littérateur. Dissatisfied with the recent architectural productions of the country—and whatever he may have thought of the superiority of living English painters, he was satisfied of the hopeless inferiority of living English architects—he set himself eagerly to the task of propounding the true fundamental principles of architecture, and eradicating the effete fallacies derived from Greece and Rome. Accordingly in 1849 appeared his 'Seven Lamps of Architecture,' a work fully as positive, unflinching, and self-reliant in criticism, as eloquent in description, as trenchant in assertion, and as paradoxical and peculiar in matter as his former work; and one that excited perhaps even more commotion among architects than that had done among painters. The peculiarity of his theorising on this subject consisted mainly perhaps in his endeavouring to convince his readers that the "attributes of a building" are certain moral qualities, and essentially those of 'action,' 'voice,' and 'beauty;' but the book, like all his other books, entered upon a multitude of ethical and philosophical speculations connected in the author's mind by some subtle links with his main subject, and treated with his usual diffuse and glittering eloquence: it reached a second edition in 1855.

The 'Lamps of Architecture' were followed up by another and longer work, in which he illustrated his views by an examination of the older palaces of Venice, which Mr. Ruskin pointed out for study and imitation as the highest style of edifice which had been anywhere constructed. The first volume of 'The Stones of Venice: the Foundations,' appeared in 1851; the second and third volumes, 'The Sea-Stories,' and 'The Fall,' were published in 1853: like his previous works, they were goodly imperial octavo volumes, and illustrated with steel-engravings and wood-cuts from his own drawings. He also commenced the publication of a series of 'Examples of the Architecture of Venice, selected and drawn to measurement from the Edifices by John Ruskin;' but only three parts were issued (all in 1851): the examples were chiefly drawn in tinted lithography, but a few were in mezzotint. The 'Stones of Venice' probably satisfied few who took it up as an architectural work, but as a poetic rhapsody on the fallen city it was singularly interesting—full of thought and fancy and rich poetic description; abounding in eloquent musing and impassioned declamation; in admirable delineations of the ancient glory and hopeless ruin—of the historic associations and pictorial wealth—of Venice. But it also contained as much rash assumption, and hasty and passionate criticism, and no less extraordinary—though often interesting and always entertaining—digressions; to say nothing of the startling dogmas flung in as it were by the way, such as "philology—evidently the most contemptible of all the sciences," and others of almost equally ludicrous audacity. The last of his architectural publications was his 'Lectures on Architecture and Painting,' delivered at Edinburgh, 8vo, 1854. A pamphlet, 'Notes on the Construction of Sheep-Folds,' 8vo, 1851, appears to have been begun with a view to writing a dissertation on church-building, but it became under his wayward pen rather a discussion of church discipline and doctrine. Another pamphlet, 'The Opening of the Crystal Palace: considered in some of its Relations to the Prospects of Art,' 8vo, 1854, may be mentioned in this connection, as it was in reality a proposal for the establishment of a society for the preservation of Gothic buildings, and the faithful record of their present condition. As an example of his diversity we may add that he published, about the Christmas of 1851, a fairy tale entitled 'The King of the Golden River, or the Black Brothers.'

One other phase of Mr. Ruskin's art-teaching must be noticed. In 1849, as mentioned elsewhere [HUNT, W. H.; MILLAIS, J. E.], the band of young painters, styling themselves 'Pre-Raphaelites,' sprang into existence, or at least into notice. These, although to ordinary observers so unlike in their views of art to his great idol Turner, Ruskin claimed as his disciples, and their pictures as the true and natural result of a consistent working-out of the principles developed in his 'Modern Painters.' Accordingly, finding as he considered that their excellences were unappreciated, he undertook to elucidate and defend them by the publication of a pamphlet, 'Pre-Raphaelitism,' 8vo, 1851; and he has continued since to divide his homage in matters of painting pretty equally between his former and his later love. He has also published, in the pamphlet form, 'Notes on some of the Principal Pictures exhibited in the Rooms of the Royal Academy, 1855,' and a similar series of 'Notes' on the exhibition of 1856; and from the tenor of his remarks it would seem that he purposed to make the series an annual one. During the present spring (1857) he has issued another

series of 'Notes' on Turner's pictures and drawings exhibited at Marlborough House, in which he has dealt with Turner's demerits in a style which has not a little surprised those who have taken their opinion of Mr. Ruskin rather from report than from a careful consideration of his writings.

Mr. Ruskin was one of the founders of the Arundel Society, and he drew up a notice of 'Giotto and his Works,' 4to, 1854, to accompany outlines from certain of Giotto's frescoes engraved by that society. Mr. Ruskin has also, in his desire to extend the knowledge of art, delivered several lectures to artisans, on ornamentation, &c.; and for some time he directed classes in drawing in the Working Men's College, as well as by various friendly services assisting other schools and institutions, and also private students.

RUSSELL, ALEXANDER, was a native of Edinburgh, where he received his medical education. Having finished his studies in the university of that city, he came to London, and in the year 1740 was appointed physician to the English factory at Aleppo. Having made himself master of the Arabic language, he soon obtained a pre-eminence over all the practitioners in the place, and was honoured by the particular friendship of the pasha. On his return to England, in 1754, he published his 'Natural History of Aleppo,' a valuable and interesting work. It contains a description of the city and principal natural productions in its neighbourhood; together with an account of the climate, inhabitants, and diseases, and a diary of the progress of the plague in 1742-43-44. Four years after the publication of this work, a vacancy occurring in St. Thomas's Hospital, he was elected physician to that institution, which office he retained till his death in 1768. He was a man of great abilities, industry, and humanity. He presented several contributions to the Royal and Medical Societies. A second edition of his 'Natural History of Aleppo,' revised, enlarged, and illustrated with notes, by Patrick Russell, has been translated into several European languages.

RUSSELL, PATRICK, brother of Dr. Alexander Russell [RUSSELL, ALEXANDER], was born in Scotland in 1726. His father was a lawyer of great eminence in the city of Edinburgh, and of seven sons whom he brought up it is reported that not one ever gave him a moment's disquietude. Having completed his medical studies in the University of Edinburgh, Patrick Russell went to Aleppo to reside with his brother Dr. Alexander Russell. On the return of the last-named physician to England, Dr. Patrick Russell succeeded him as physician to the British factory at Aleppo. It was during his residence in this capital that the great plague of 1760 and the two following years broke out in Syria, and he readily availed himself of the opportunities which it afforded him of studying this disease in all its varieties. His quarto work on the plague, which was published some years after his return to England, is justly esteemed one of the best and most complete that ever has been written on the subject. It contains an historical and medical account of the disease, and treats fully the subjects of quarantine, lazarettos, and the police to be adopted in times of pestilence. He also gave to the public a new and very enlarged edition of his brother's work on Aleppo, and in 1796 published an account of the Indian serpents collected on the coast of Coromandel, containing descriptions and drawings of each species, together with experiments and remarks on their several poisons. He died in 1805.

\* RUSSELL, THE RIGHT HON. LORD JOHN, is the third and youngest son of the sixth Duke of Bedford, by his first wife, the Hon. Georgiana Elizabeth, the second daughter of the fourth Viscount Torrington. His eldest brother, the present or seventh Duke, is four years his senior. He was born in Hertford-street, London, on the 18th of August 1792, and was educated first at Westminster school, and afterwards at the University of Edinburgh, where he attended the Moral Philosophy lectures of Dugald Stewart and Thomas Brown. It was Lord John Russell, who headed the deputation of students that waited on Dugald Stewart to congratulate him on his recovery from the illness which had caused him to have recourse to Brown's help, and to thank him for having procured so valuable a substitute. In 1813, at the age of twenty-one, he entered the House of Commons as member for Tavistock, of which borough his father had the disposal; and, faithful to the hereditary Whiggism of the House of Bedford, he attached himself at once to the opposition, who were then maintaining Whig principles against the powerful ministry of Liverpool and Castlereagh. It was about this time that the cessation of the European war left the mind of the nation free to return to home-politics; and the first portion of Lord John Russell's parliamentary career is identified with the progress of that stubborn contest which the Whig opposition, with the country at their back, carried on inch by inch till the year 1827 against the reigning Toryism. His abilities and the industry and conscientiousness with which he devoted himself to politics as his business concurred, with the advantages of his birth and connections as a scion of the great ducal house of Bedford, to give him very soon the place of a leader among the Whig politicians. While taking part in all the Whig questions, he fastened from the first with extraordinary tenacity on the main question of parliamentary reform, bringing forward or supporting year after year measures for the suppression of rotten boroughs and the enfranchisement of large commercial towns. Lord Brougham, after speaking of the great services rendered to the cause of Reform at this time in parliament by Earl

Grey, Sir Francis Burdett, Lord Durham, and others, says, "But no one did more lasting and real service to the question than Lord John Russell, whose repeated motions, backed by the progress of the subject out of doors, had the effect of increasing the minority in its favour, in so much that, when he at last brought it forward in 1826, Mr. Canning [then Castlereagh's successor in the Foreign Secretaryship in the Liverpool Cabinet, but virtual head of the government] finding he could only defeat it by a comparatively small majority, pronounced the question substantially carried. It was probably from this time that his party perceived the prudence of staying a change which they could not prevent." The bill, the proposal of which had this important effect, was one for disfranchising certain rotten boroughs and substituting large and important towns in their place. At the time of proposing it Lord John was no longer member for Tavistock, but for Huntingdonshire, which county he had represented since 1820.

While thus laying the foundation of his reputation as a serious and persevering Whig statesman, and as the man among the junior Whigs who had made the question of parliamentary reform most thoroughly his own, Lord John had at the same time made various appearances as an author. In 1819 he published in quarto a 'Life of William, Lord Russell, with some Account of the Times in which he lived'—a graceful and characteristic tribute to his celebrated Whig ancestor. The work was followed in 1821 by 'An Essay on the History of the English Government and Constitution, from the Reign of Henry VII. to the present Time;' and this again by an effort in verse entitled 'Don Carlos, or Persecution, a Tragedy in five Acts,' published in 1822, and which went through several editions in the course of that year. The subject of the tragedy is the story of Don Carlos of Spain, the son of Philip II., already dramatised by the genius of Schiller. In 1824 Lord John published the first volume of a work of a different character, entitled 'Memoirs of the Affairs of Europe from the Peace of Utrecht,' but the work was not completed till 1829. Several lighter productions; in the shape of sketches, &c., also came from his pen about this period; and indeed for a time he seemed to be divided between politics and literature. This was the period of his first intimacy with Moore and with others of the literary men who used to frequent the society of Lord Lansdowne and of Holland House; and there is extant a poem of Moore's, remonstrating with Lord John Russell on an intention which he had intimated to Moore in conversation, of withdrawing from political pursuits altogether:—

"Shalt thou be fainthearted and turn from the strife,  
From the mighty arena, where all that is grand  
And devoted and pure and adorning in life  
'Tis for high-thoughted spirits like thine to command?"

Fortunately, Lord John did not carry out his intention, but continued in that career of political life, in which it was, and not specially in literature, that nature had fitted him to excel.

The prostration of Lord Liverpool by apoplexy in April 1827 called Canning to his brief premiership. His administration (April 1827—August 1827) and that of his successor, Lord Goderich (August 1827—January 1828), formed a period of peculiar difficulty for the Whigs, more especially on the Reform question. Canning's Tory colleagues of the Liverpool government having refused to serve under his premiership, he had to solicit the Whigs to join him so as to form a Coalition government. As however Canning had pledged himself to oppose reform, and as he had also engaged to the king not to bring forward any measure of Roman Catholic emancipation, it was argued by some Whigs that his government would, in fact, in all except foreign questions, be a Tory one, and that to join it would be to betray Whig principles. Earl Grey took this view, and refused to join the Coalition. Lord Lansdowne, Mr. Tierney, Lord Brougham, and the majority of the Whig leaders thought otherwise; and Lord Lansdowne and Mr. Tierney became members of Canning's ministry. The effect, at all events, was temporarily to arrest the Reform question. It could not be urged without breaking up the Coalition; and, as Lord Lansdowne and other leading Whigs were in the Coalition, Lord John Russell (who had in 1826 vacated his seat for Huntingdonshire and now sat for Bandon-Bridge) had to defer to circumstances, and allow his favourite measure to lie over. It was not till the resignation of Lord Goderich, and the formation of a regular Tory ministry of the old kind under the Duke of Wellington (1828), that the Whig zeal of Lord John was again free to act vigorously and aggressively. During the Wellington ministry (January 1828—November 1830) no man was more active and resolute in urging Whig views, and in driving the government forward against their will. In 1828 he moved for the repeal of the Test Acts; and in 1830—by which time the reluctant concession of Roman Catholic emancipation by Wellington's ministry had left the question of parliamentary reform almost alone to occupy the public mind—he submitted, though unsuccessfully, a scheme for conferring the franchise on Leeds, Birmingham, and Manchester.

On the resignation of the Wellington ministry in November 1830, Lord John Russell, then in the thirty-ninth year of his age, entered on office for the first time, as Paymaster of the Forces, under the Reform or first Whig ministry of Earl Grey—a ministry which the death of George IV. and the accession of William IV. had rendered possible. Parliamentary reform was now the one paramount question of national interest; and the new ministry had come in expressly

because the country wished them to carry it. The man on whom the most important part of the work devolved was Lord John Russell. He was one of four members of the ministry—the others being Lord Durham, Sir James Graham, and Lord Duncannon—who were appointed to shape and prepare the bill and submit it to their colleagues; and on the 1st of March 1831 he brought before the House of Commons the bill so prepared and agreed upon. Some measure of reform had been expected; but a bill of so comprehensive a kind as this took the country by surprise. It annihilated or put into Schedule A sixty close boroughs; it put into Schedule B, or, in other words, deprived of one member each, forty-seven decayed boroughs; it extended the franchise in counties to all copyholders to the value of 10*l.* per annum, and to leaseholders of 50*l.* or upwards; in boroughs it conferred the right to vote on all householders rated at 10*l.* or upwards; it erected twenty-seven towns for the first time into boroughs; it created four new metropolitan boroughs; and it separated twenty-seven of the larger counties into electoral divisions. A bill so sweeping (the merit of the more than Whig liberality of which is supposed to have been owing chiefly to Lord Durham, who is said to have even persuaded his colleagues in the committee of preparation to introduce the ballot into the draft, though it was afterwards struck out by the ministry) was considered to amount to little less than a social revolution. When Lord John produced it in the House, it was received by the opposite party almost with derision, as utterly impracticable. But the enthusiasm with which the bill—so far surpassing all expectations—was taken up out of doors changed the derision into alarm. The members of the Tory party mustered all their strength against the bill; and in the Commons Sir Charles Wetherell, Mr. Croker, Mr. Banks, and Sir Robert Peel appeared as champions more especially of ‘close boroughs’ as a necessary part of the British Constitution. After debates of unparalleled violence, Lord John’s bill passed the second reading by a majority of *one*. On the motion for going into committee, however, the bill was thrown out by a majority of eight; and it became necessary that the ministry should either resign or dissolve parliament.

They adopted the latter alternative. The nation responded with extraordinary decision. Regarding the promised ‘Reform’ as little short of a promised millennium, the constituencies withstood the influence of great Tory landlords, &c., and to a greater extent than could have been conceived possible, returned Reformers. In this general election Lord John was returned for the county of Devon. When the new parliament met, the progress of the bill through the House of Commons was, of course, triumphant. Then came the opposition of the peers. The bill reached the House of Lords on the 22nd of September 1831; and on the second reading it was thrown out by a majority of 41. A vote of confidence passed in the Commons by a majority of 131 was the immediate answer to this; and it saved the ministry the necessity of resigning. Parliament was prorogued to give opportunity for modifying the bill; and on its re-assembling the bill again went to the Lords altered in some points, but with the all-important Schedule A and the Ten Pound Household franchise still remaining. Still the Lords were hostile; Lord Grey was placed in a minority of 35; and, after a long interview with the king, he and his colleagues resigned, and the government was entrusted to the Duke of Wellington (May 9, 1832). It was now a face to face contest between the duke as the representative of Toryism, and the nation vehement for reform and ready to go to civil war for it. The issue is known. The Duke saw that he and the peers must yield; Earl Grey resumed the ministry (May 18), and on the 7th of June 1832 the Reform Bill became the law of the land. The name of Lord John Russell will be ever identified with this important crisis in the history of his country; and his conduct during the fifteen months in which the bill was in suspense added greatly to his popularity.

In the new or first reformed parliament Lord John sat as member for the electoral district of South Devon (1832-35). He still continued to hold the comparatively subordinate office of Paymaster of the Forces in the Grey and Melbourne ministry, till that ministry was broken up by internal differences and secessions, and succeeded (December 1834) by the Conservative ministry of Sir Robert Peel. In the various important measures that had been passed by the Grey ministry he had his full share; and when he went into opposition, it was with the character of having been one of the most consistent of the ministry in genuine Whig principles. Earl Grey had by this time withdrawn from public life; Lord Stanley and Sir James Graham had seceded from the Whigs on the question of the Irish Church; Lord Brougham was assuming that position of political isolation in which he has since remained; and Lord Durham was tending towards radicalism. With the exception of Lord Melbourne, Lord John Russell was now preeminently the representative of historical Whiggism. Accordingly, when Sir Robert Peel, finding his attempt at a Conservative government abortive, resigned office in April 1835, and a new Whig ministry was formed under Lord Melbourne, the Home Secretaryship, and with it, the dignity of ministerial leader in the House of Commons, was assigned to Lord John. He had been ousted from his seat for South Devon and now sat for Stroud—a borough which he continued to represent till 1841. In 1839, Lord John exchanged the post of Home Secretary in the Melbourne ministry for that of Colonial Secretary, which he held while the ministry lasted. In both

these posts he earned the character of a punctual and able administrator; while his contemporary activity in parliament in carrying the Municipal Reform Act and the other measures of the ministry corresponded with his place as its virtual head. About this time however the character of being too much of a ‘Finality’ Reformer began to attach to him; and the more advanced liberals of the country began to attack him in that character. An Exposition of much of his political creed at this time will be found in his published ‘Letters to the Electors of Stroud on the Principles of the Reform Act’ which went through various editions.

But Whiggism generally was not so popular throughout the country as it had been, the experience of some nine years having abated the enormous expectations awakened by the Reform Bill, while the formidable power of O’Connell was also telling against the Whigs. This was shown by the result of the general election of 1841. In the August of that year, Lord Melbourne in the House of Lords, and Lord John Russell in the House of Commons, announced the resignation of the Whig ministry. Sir Robert Peel came into power at the head of that Conservative administration which lasted till July 1846. During these five years (August 1841 to July 1846) Lord John’s position in parliament was that of leader of the Whig opposition. He no longer however sat for Stroud, but for the city of London, having been elected in 1841 as one of the representatives of this great constituency. As leader of the opposition he was true to his character as a moderate Whig of the historical school rather than a violent chief of faction eager to oust his opponents and adapting his principles and his promises to that end. But the great movement of the day was not one having much connection with Whiggism proper. While Messrs. Cobden and Bright were conducting the Anti-Corn Law agitation out of doors, and the opinion of the country was flowing mainly in the channel of this great question, Lord John Russell’s relation to it was rather that of an observer from within parliament than of an active guide one way or the other. At first, indeed, he, as well as the Conservatives, was opposed to the League; and his favourite solution of the problem was by a small fixed duty on foreign corn. At length however in a letter from Edinburgh addressed to his constituents, he spoke out in favour of total repeal. This was in the autumn of 1845. It was not destined however that a Whig ministry should settle this great question. Sir Robert Peel himself came to the desired conclusion, and by his exertions and influence among the Conservatives, the Corn Laws were abolished (July 26, 1846).

The ministry of Sir Robert Peel having been shortly afterwards broken up by the rejection of his Irish coercion bill, Lord John Russell was called to the premiership as the head of a Whig ministry. He held the office of premier from July 1846 to March 1852. The general complaint made against his administration both at the time and since, was that it was non-progressive and fruitless of important measures. ‘The Whigs in office,’ it was said ‘do less than the Conservatives.’ The reason of this complaint, so far as it was just, may have lain partly in Lord John’s own character, as a Whig of the historical school, adverse not only to the ballot but to many of those other measures on which the more advanced Liberals had set their hopes and which they had in view when they spoke of progress. In a great measure however it consisted in the broken-up state of parliamentary parties. There were now the Peelites, and the Protectionists or Derbyites, as well as the Whigs and the advanced Liberals, and among these parties Lord John could depend on but a small and varying majority. Nor in those cases in which he did make attempts of an energetic character was he fortunate in conciliating support to his policy. His ‘Letter to the Bishop of Durham in reference to the usurpation of the Pope of Rome’ published in 1850, just after the bull appointing Cardinal Wiseman Roman Catholic Primate of England and other Roman Catholic Bishops in various English sees, occasioned much adverse comment; and the Ecclesiastical Titles Bill, dealing with the same question, proved a failure. Towards the close of 1851, too, his government was farther weakened by the secession of Lord Palmerston, who then quitted the foreign office in circumstances having the appearance of a rupture with the Whigs on account of offence taken at his foreign policy. Accordingly, in March 1852, the country saw with little concern Lord John’s ministry defeated on a Militia Bill, which they had introduced with a view to provide for the defence of the country in case of a foreign war. The blow to the ministry was given by Lord Palmerston, who proposed an important alteration in the ministerial measure. The government thus passed into the hands of Lord Derby and Mr. Disraeli, who had in the mean time reorganised a strong Protectionist or old Tory party.

After holding office for some months, the Derby-Disraeli government broke down on the budget, and the celebrated Coalition Cabinet was formed with Lord Aberdeen at its head (December 1852). In this cabinet Lord Palmerston took the office of Home Secretary; and Lord John Russell held that of Foreign Secretary till February 1853, when he resigned it to Lord Clarendon. From February 1853 till June 1854 he preferred the somewhat anomalous position of a member of the Cabinet without office; but in June 1854 he accepted the office of Lord President of the Council. In this office, he brought forward in that year a new Reform Bill which he had prepared in the last year of his own premiership and had hoped then to carry. Both the country and Parliament however being then engrossed with the begin-

nings of the great Russian war, Lord John was obliged to abandon his favourite measure, or at least to postpone it to a more convenient time. Nor was it long before he found occasion to differ with Lord Aberdeen and the Peelite portion of the government on the conduct of the war. Refusing to share the unpopularity attached to the Aberdeen ministry on account of the disasters in the Crimea, Lord John resigned his connection with it before its final disruption in January 1856. Accordingly, when Lord Palmerston formed his ministry for the more vigorous prosecution of the war, Lord John consented to serve under him as Colonial Secretary. This connection between two men whose antecedents had made them to some extent rivals did not last long. When the Vienna conferences were agreed upon with a view to the conclusion of a peace between Russia and the Allies, Lord John accepted the offer made by Lord Palmerston that he should be British plenipotentiary at the Conferences. The issue of his lordship's negotiations in this capacity did not give satisfaction; and in June 1855 he resigned his place in the ministry, and left to Lord Palmerston the honour and responsibility of concluding the war in a manner that the nation would approve.

From that time till the moment at which we write (April 1857) Lord John's position in parliament has been that of an independent statesman—sometimes supporting and sometimes criticising Lord Palmerston's policy, and in the mean time waiting, it is supposed, till events recall himself to power and enable him to initiate a new era of Whiggism by another Reform Bill. He was one of that miscellaneous majority who supported Mr. Cobden's motion, condemning Lord Palmerston's government, on account of the hostile proceedings against Canton, and so occasioned the dissolution of parliament in March 1857. Public feeling so thoroughly going along with Lord Palmerston on this "China question," it was supposed that Lord John Russell would lose his seat for London, if he presented himself for re-election. Efforts were made to oust him; but he was bold enough to go to the poll; and the recollection of his past services so far prevailed over temporary dissatisfaction with him that he was returned third on the list. At the present moment (April 1857) there is much speculation as to what may be his future career. That he may yet lead the country in great home-questions is everywhere regarded as a likelihood; and it remains yet to be seen whether Lord Palmerston's relations to him and his to Lord Palmerston will be such in the new parliament that the country can have the services of both without the spectacle of their rivalry.

Lord John has been twice married—first to Adelaide, eldest daughter of Thomas Lister, Esq. of Armytage Park, and widow of the second Lord Ribblesdale; and secondly, to Lady Frances, second daughter of the Earl of Minto. He has a family. Among his literary appearances, besides those that have been mentioned, and besides numerous political letters, &c., are 'A Selection from the Correspondence of John, fourth duke of Bedford, from the Originals at Woburn Abbey, with an Introduction,' 1842-3; 'Memorials and Correspondence of Charles James Fox,' edited, &c., 1853 et seq.; and 'Memoirs, Journal and Correspondence of Thomas Moore,' edited &c. 1853-6. Lord John has also not unfrequently lectured at educational and other institutions: and some of these lectures have been published—the latest being one on 'The Obstacles which have retarded Moral and Political Progress,' delivered in Exeter Hall before the Young Men's Christian Association in 1856. He has recently announced his intention not to lecture in public any more—but to devote his time rather to furthering the cause of education as a statesman.

RUSSELL, LORD WILLIAM, was born in September 1639: his ancestors were early possessed of landed property in Dorsetshire. We find John Russell in 1221 the constable of Corfe Castle, and his descendants subsequently filling honourable situations: one of them, Sir John Russell, was Speaker of the House of Commons in the second and tenth year of Henry VI. A fortunate occurrence raised this family to wealth and honour; in 1506 Philip, archduke of Austria, having been driven by a storm into the port of Weymouth, was hospitably entertained by Sir Thomas Trenchard, a neighbouring country gentleman; and Sir Thomas, knowing that the then head of the Russell family had travelled and was a good linguist, invited him to meet his unexpected guest. During this visit Mr. Russell so pleased the archduke that he recommended him to the king, by whom he was appointed one of the gentlemen of the Privy Chamber. "He afterwards attended Henry VIII. in his expedition in France, and was present at the taking of Therouenne and Tournay. In 1522 he was knighted by the Earl of Surrey for his services at the taking of Morlaix in Bretagne, and was created Lord Russell in 1539." The lands of the abbey at Tavistock and of the dissolved monastery at Woburn were afterwards conferred upon him, and he was made Earl of Bedford. ('Life of Lord Russell,' by his descendant Lord John Russell, from whose work the principal part of this article is derived.) He died in 1555, and was succeeded by Francis, the second earl, who left no issue. The title now passed to the only son of Sir William Russell, by name Francis, who is known among other things for his drainage of the fens of Lincolnshire by the Bedford level. He died in 1641, and was succeeded by William Russell, who married Lady Anne Carr, daughter of the Countess of Somerset, known for her participation in Sir Thomas Overbury's murder, and had issue, three daughters and seven sons, of

whom Lord William Russell, the subject of this memoir, was the third. The eldest died an infant, and the second in 1678.

Lord William Russell was educated at Cambridge, afterwards resided at Augsburg, spent a considerable time in different parts of the Continent, returned to England at the Restoration, and was elected member for Tavistock. He married, in 1669, Rachel Wriothesly, second daughter of the Earl of Southampton, and widow of Lord Vaughan, the eldest son of Lord Carberry, a woman distinguished for ardent and tender affection, pious, reflecting, firm, and courageous; alike exemplary in prosperity and adversity, when observed by multitudes or hidden in retirement.

In the company of his excellent wife Russell would have continued to enjoy without interruption all the happiness of a private life, had the government been conducted with security and honour. But his indignation and fears being awakened by the hypocrisy and shameless venality of Charles II., and the avowed desire of the Duke of York to restore the Roman Catholic religion, he entered the lists of political contention, ranging himself with the defenders of Protestantism and the opponents of the king's devices. He gave great strength to the popular cause; "I never knew," says Burnet, "any man have so entire credit with the nation as he had. He quickly got out of some of the disorders into which the court had drawn him, and ever after that his life was unblemished in all respects. He had from his first education an inclination to favour the nonconformists, and wished the laws could have been made easier to them, or they more pliant to the law. He was a slow man and of little discourse; but he had a true judgment when he considered things at his own leisure. His understanding was not defective, but his virtues were so eminent that they would have more than balanced real defects if any had been found in the other." Lord Cavendish, Sir W. Coventry, Colonel Birch, Mr. Powle, and Mr. Littleton were the principal members of the party with which he acted, and which, by proceeding at first with moderation, gained so great an influence in the country, that the king suddenly prorogued the parliament, and when it re-assembled, found his opponents so strong that it was hopeless to attempt the continuance of the Dutch war. Thus the alliance with France was dissolved, and the troops by which Charles had wished to make himself absolute were dispersed; the Cabal ministry was broken up, and Buckingham and Shaftesbury were converted into popular leaders. The king's intrigues with France were speedily renewed, and engagements entered into, for the performance of which he was again to receive a stipulated sum of money. These intrigues were further opposed by Russell; the country party recommended war with France, promoted the impeachment of the king's minister and favourite Lord Danby, and voted the exclusion of the Duke of York from the succession to the throne. These were violent measures, but they were justified by the condition of the country, the king's baseness, and the fear of despotism and the re-establishment of the Roman Catholic religion. The struggle augured a second civil war, and had Charles, like his successor, attacked the church as directly as he did the constitution, an immediate civil war would have been the probable result; as it was, the foundation of a future revolution was laid.

Some of the principal Whigs were accused of having conspired to take the king's life, to raise a rebellion in the country, and to establish the Duke of Monmouth, the king's illegitimate son, upon the throne. This was called the 'Rye-house Plot,' from the name of a farm near Newmarket, at which it was said that the conspirators agreed to meet, in order to attack and dispose of the king as he returned from Newmarket races. There had doubtless been many meetings of disaffected persons, in which Russell took part. The court ascribed the king's safety to his return from Newmarket somewhat earlier than was expected, and prepared to take advantage of the opening which now offered for the annihilation of their political adversaries. Russell, Essex, Sidney, and a number of less important persons were immediately committed to the Tower. Some were convicted and executed before Russell was brought to the bar. On the 13th of July 1683 he took his trial at the Old Bailey for high treason. He was indicted "for conspiring the death of the king, and consulting and agreeing to stir up insurrection; and to that end to seize the guards for the preservation of the king's person." A full account of the proceedings is given by Lord John Russell ('Life,' p. 184), and in Phillips's 'State Trials.' We believe that the extent of his error was having attended a meeting where a general rising was spoken of, and where there was some discourse of the feasibility of seizing the king's guard. It was not shown that he consented to either of these schemes, which were never matured or determined on. An illegal construction was put on the 25th of Edward III., the statute under which he was indicted. The evidence against him was contradictory and insufficient; no one charge in the indictment was proved; but in the nomination of the panel, the sheriffs, who were creatures of the court, had secured his conviction. He was found guilty and sentenced to death.

From the time that the sentence was passed till the day of his execution, he manifested great piety, and maintained a dignified calmness. He was accompanied to the scaffold by Bishop Burnet and Dean Tillotson. Burnet, who likewise attended him during his imprisonment, has written an account of his latter days. He delivered to the sheriffs, at the time that he was beheaded in Lincoln's Inn Fields, on the 21st of July 1683, a paper containing an explanation and statement of his

conduct. Speaking of those who died for this plot, Fox says (Introductory Chapter to 'History of James II'), "that which is most certain in this affair is, that they had committed no overt act indicating the imagining the king's death, even according to the most strained construction of the statute of Edward III., much less was any such act legally proved against them; and the conspiring to levy war was not treason, except by a recent statute of Charles II., the prosecutions upon which were expressly limited to a certain time, which in these cases had elapsed; so that it is impossible not to assent to the opinion of those who have ever stigmatised the condemnation and execution of Russell as a most flagrant violation of law and justice." The firm and noble conduct of Lady Russell, who attended her husband during his trial to take notes and give him assistance, deserves the greatest admiration. The bitterness of their parting is described in the most pathetic terms, and a lasting grief is shown in her subsequent correspondence. She died at Southampton House, in September 1723, at the advanced age of eighty-six.

We have not mentioned the charge made against Lord Russell, in common with Algernon Sidney, and many others of less repute, of having received bribes from the French government. That he did receive money appears certain, unless the authority of Barillon can be overthrown, but that it was as a bribe to serve French interests we believe to be quite untrue. The character of both Russell and Sidney is wholly at variance with such an act. As a politician, Russell appears uniformly disinterested; he was zealous and energetic, though not conspicuous for ability, the high public estimation in which he was held being founded upon his sense, his judgment, and his integrity. The reader who wishes to inquire further into the subject must refer to the more lengthened biographies and the authorities there referred to; he will do well also to look at Macaulay's 'History,' and especially at the more calm and judicial investigation of Hallam in the second volume of his 'Constitutional History.'

Lord Russell's son was created Duke of Bedford; one of his daughters was married to the Duke of Devonshire, and another to the Duke of Rutland. An act for annulling his attainder, which passed in the first year of William and Mary, recites that "he was by undue and illegal return of jurors, having been refused his lawful challenge to the said jurors for want of freehold, and, by partial and unjust constructions of law, wrongfully convicted, attainted, and executed for high treason." After the executions which followed the Rye House Plot, the country party had little influence during the remainder of Charles's reign.

RUSSELL, WILLIAM, LL.D., the son of poor parents, was born in the county of Selkirk in 1741, and educated, very imperfectly, in the country and in Edinburgh. He served a regular apprenticeship as a printer, and, while working as a journeyman in Edinburgh, edited a collection of modern poetry, and executed a translation of a tragedy of Cr billon, which was submitted to Garrick, but rejected. In 1767 he went to London to seek his fortune, but for some time found nothing better than a place as corrector of the press for Strachan the printer. While so employed he contributed to periodicals, and published unsuccessfully several poetical and other volumes, among which was a 'History of America.' In 1779 appeared the first two volumes of the popular compilation by which he is now known, 'The History of Modern Europe.' The third, fourth, and fifth volumes, bringing down the narrative to 1763, were published in 1784. In 1787 he married, and took up his residence on a farm in Dumfriesshire, where he spent the remainder of his life. In 1793 he published the first two volumes of a 'History of Ancient Europe;' and he had also begun, in terms of an engagement with Mr. Cadell, to compose a 'History of England from the Accession of George III.' These unfinished works however, as well as several tragedies and comedies, were stopped by his death, which took place on the 25th of December 1793.

\*RUSSELL, WILLIAM HOWARD, who has earned celebrity by his picturesque and vivid descriptions of the operations of the armies in the Crimea, was born in Dublin in 1821, and was educated at Trinity College, Dublin. While here, in 1841, an uncle, who was engaged as a reporter on the 'Times' newspaper, proposed to him to write an account of the Longford election: this he executed most successfully. In the following year he came to London, in hopes of being engaged as a reporter; but failing at the time, he entered himself at Cambridge University, and supported himself by writing for various periodical works, among others for the 'Sporting Magazine.' After a short residence in Cambridge, he obtained the appointment of mathematical master in Kensington grammar-school. In 1845 however, when the monster-meetings for the repeal of the Union were taking place in Ireland, he was applied to by the managers of the 'Times' to attend and to write the descriptive portions of them, the speeches being reported by others; and he did this with a vividness, an energy, an accuracy, and a fearless honesty, that won him great applause. When the trial of O'Connell took place in Dublin, Mr. Russell was sent as reporter; and brought over the verdict, given at twelve o'clock on Saturday night, so as to publish it in the 'Times' on Monday morning. When the 'Daily News' was started in 1845, he was led to expect an engagement upon it offering him superior pecuniary advantages, and he resigned his connection with the 'Times;' but as this expectation was disappointed he entered himself at the Temple, and almost immediately made an arrangement with the 'Morning

Chronicle' as reporter, and in this capacity visited Ireland to investigate the consequences of the distress occasioned by the potato blight in 1846. In 1847 he returned to the 'Times,' for which he reported the trials of Smith O'Brien and his associates at Clonmel, the Kossuth demonstrations, the Queen's visits to Belgium and Ireland, ships launches, and many other things for which his picturesque and ready pen was adapted. On the sailing of the expedition to the Crimea, he was deputed by the 'Times' to accompany it in order to report its proceedings, and he proceeded thither with the first detachment. He soon distinguished himself by his intrepidity in taking up the most dangerous positions so as to enable him to see and describe the military events; he was present at the battle of the Alma; had more than one escape from shot, and more than a full share of the discomforts experienced by the troops, under which he more than once succumbed, and was dangerously ill. The most striking characteristics of his reports however were the quick-sightedness with which he discerned all the defects of arrangement, and the dauntless honesty with which he exposed them. His letters excited so much attention that, contrary to the almost uniform custom of the 'Times,' the name of the reporter became known, and was recognised in the paper. He returned to England, after visiting Moscow and describing the coronation of the czar. His letters, with some modification, have been published under the titles of 'The War, from the Landing at Gallipoli to the Death of Lord Raglan, 1855;' and 'The War, from the Death of Lord Raglan to the Peace at Paris, 1856;' in 2 post 8vo volumes; and he has since published 'The Expedition to the Crimea, with Maps and Plans,' issued in monthly parts. In 1856 he was created LL.D. of Trinity College, Dublin.

RUTHERFORD, DANIEL, was born at Edinburgh in November 1749, and was educated at the university of his native city. In 1772 he took his degree of M.D., and it was in the thesis which he printed upon this occasion, entitled 'De Aere Mephitico,' that he announced the discovery for which he is chiefly remembered, of the gas which has since been called azote or nitrogen; for Rutherford merely indicated its existence as a peculiar air, and neither gave it any name nor explained its properties. The same discovery was also made about the same time by Dr. Priestley, and was announced by him in his paper 'On the Different Kinds of Air,' which obtained the Copley medal, and was published in the 'Philosophical Transactions' for 1772. Dr. Rutherford was admitted a Fellow of the Edinburgh College of Physicians in 1777, and in 1786 he was appointed professor of botany in the university. He died on the 15th of November 1819.

RUTHERFORTH, THOMAS, D.D., was born in the parish of Papworth-Everard, Cambridgeshire, in the year 1712. Having taken his degree and obtained a fellowship in St. John's College, Cambridge, he was appointed Regius Professor of Divinity in the university, and created D.D. He was afterwards elected a Fellow of the Royal Society, and obtained the preferments of the rectory of Barley in Hertfordshire, Shenfield in Essex, and the archdeaconry of Essex. He died in October 1771.

Besides single sermons and charges to the clergy, Dr. Rutherford is the author of the following works:—'*Ordo Institutionum Physicarum, in privatis suis Lectionibus*,' sm. 4to, Camb., 1743; '*Essay on the Nature and Obligations of Virtue*,' 8vo, Lond., 1744; '*A System of Natural Philosophy, being a Course of Lectures on Mechanics, Optics, Hydrostatics, and Astronomy*,' 2 vols. 4to, Camb., 1748; '*A Letter to Dr. Middleton, in Defence of Bishop Sherlock on Prophecy*,' 8vo, 1750; '*A Discourse on Miracles*,' 8vo, 1751; '*Institutes of Natural Law, being the substance of a Course of Lectures on Grotius De Jure Belli et Pacis*, read in St. John's College, Cambridge,' 2 vols. 8vo, Lond., 1754-56. A list of his sermons, tracts, and charges is given in Watt's '*Bibliotheca Britannica*.'

RUTILIUS LUPUS, a Roman rhetorician, who was a contemporary of Quintilian (Quinct., '*Inst. Orat.*' iii., 1, p. 150, Bipont), but of whose life we have no particulars. We possess a small treatise of his on rhetoric, entitled '*De Figuris Sententiarum et Elocutionis*,' which we learn from Quintilian (ix. 2, p. 152) was taken from a work of a contemporary of the name of Gorgias, in four books. The treatise of Rutilius does not appear to have come down to us in the same state in which he wrote it. It is now divided into two books, whereas Quintilian says that it was only in one. It is several times quoted by Quintilian, and is still valuable for the quotations which it contains from writers now lost.

The work of Rutilius was originally published by Roscius Ferrariensis, 8vo, Venet., 1519; and afterwards by Ruhnkens, 8vo, Lug. Bat., 1768, the latter of which was republished by Frotscher, 8vo, Lips., 1831. There is also an edition by F. Jacob, 8vo, Lub., 1837.

RUTILIUS, NUMATIANUS, CLAUDIUS, a Roman poet at the beginning of the 5th century of the Christian era, was a native of Gaul, and held at Rome the high offices of *magister officiorum* or *palatii*, and *præfectus urbi*. Having occasion to return to his native country, he gave an account of his voyage, in a poem entitled '*Itinerarium*,' written in elegiac verse, and consisting of two books, of which the greater part of the latter is lost. Rutilius made the voyage in a small vessel, which put into shore during the night and sailed again in the morning. He describes with much beauty, and in the genuine spirit of poetry, the towns, ruins, and various objects of nature and art which he saw, and deeply laments the ravages which had been

committed by the barbarians of the north. Rutilius was a pagan, and in his voyage gives an account of the monks who lived at Capraria, and in other parts of his poem makes allusion to the state of Christianity at that time.

The poem of Rutilius was first printed in 1520, 4to, Bonon. The best edition is by Zumpt, Berlin, 1840. Other useful editions are by Damm, Brandenb., 8vo, 1760; by Kappius, 8vo, Erlang., 1786; and by Gruber, 8vo, Norimb., 1804.

RUYSCH, FREDERIC, a celebrated anatomist, was born at the Hague, in 1638. His father was secretary of the States-General of Holland. He studied medicine at Leyden, took his doctor's degree in 1664, and then returned to practise at the Hague. In 1665 he published his first work on the valves of the lymphatic vessels, and in the following year he was appointed to the professorship of anatomy at Amsterdam. From this time he devoted himself entirely to the study of anatomy, or rather to the formation of an anatomical museum, for he seems to have regarded the science of anatomy as a pursuit far inferior to the art of preparation-making. In this art he was unequalled by any of his contemporaries, and the accounts given by those who saw his museum, of the perfect state in which the bodies of children and animals were preserved, with all the apparent freshness and bloom of life, if they could be entirely credited, would be sufficient evidence that he has not yet had a rival in the preservation of bodies. In the art of dissecting and of injecting the blood-vessels however, in which Ruysch was supposed to be equally eminent, he has long been far surpassed; and it is probable that his best preparations of this kind were not superior to those which are ordinarily made at the present day.

Ey unceasing labour Ruysch collected a most extensive museum of anatomical preparations of all kinds, for which, in 1698, Peter of Russia gave him 30,000 florins. It was then conveyed to Petersburg, where, it is said, the greater part has since decayed, and become useless. After selling his first museum, Ruysch commenced with unabated ardour to collect a second, a part of which, at his death in 1731, was sold to the king of Poland for 20,000 florins.

Ruysch's merits as an anatomist have been greatly overrated. In all his works, which make up five large quarto volumes, there is no evidence that he was more than a plodding anatomical artist. Though he claimed many discoveries, those that really belong to him are few and not important; and in proportion to the labour expended in the pursuit of anatomy, few have contributed less to its progress as a science, for he did not even publish the modes of making his preparations.

RUYSDAEL, or RUYSDAAL, JACOB, a landscape-painter, was born at Haarlem, in 1635. He was originally brought up to surgery, which he practised for a short time, but he appears to have painted at an early age, and eventually he adopted painting as his profession. He most probably received the first instruction in his art from his elder brother Solomon, who was also a good landscape-painter, but his reputation has been lost, or rather obscured, by the superior name of his brother. Solomon was born also in Haarlem, in 1616, and died there in 1670; he was the scholar of Schoefft and Van Goyen. He distinguished himself by the invention of an admirable composition in imitation of variegated marbles.

Jacob Ruysdael became the friend of Nicolas Berghem, and, as has been reported, his scholar; but this, if we may judge from the extreme dissimilarity of their styles, is highly improbable. Ruysdael was a simple but accurate imitator of nature, and his taste inclined him towards the wild and the secluded. He displayed an exquisite judgment in the selection of his subjects, and for the power and at the same time the truth of his imitations he has scarcely been equalled. Woods and waterfalls are the prevailing subjects of his landscapes, and he rarely painted a scene without introducing either a cascade or a rivulet. He occasionally also painted marine pieces.

Ruysdael's works, independent of their powerful effect and masterly imitation, are distinguished from those of other masters by the peculiarity that the foregrounds generally constitute the pictures, the distances being introduced simply as accessories to complete the view, and he may be said perhaps never to have produced a mere scenic effect. His colouring, though warm, as his foliage, is that of a northern climate, and it is improbable that he ever visited Italy; he was fond of rather cold and cloudy skies with sudden and powerful masses of light and shade. Ruysdael never painted figures; those which are introduced into his compositions were painted by Ostade, Wouwer-manns, a Vandevelde, or Berghem.

His works are held in the highest estimation by collectors of old paintings. There are fine specimens of them in most of the principal collections of Europe though none in the National Gallery. The 'Stag-Hunt,' in the Royal Gallery of Dresden, the figures of which are by Vandevelde, is generally reputed to be his masterpiece; but there is a large woody landscape in the Doria Gallery at Rome, of surprising power and beauty, which is certainly unsurpassed by any production of its class. Ruysdael also etched a few plates in a very bold and effective style, but impressions from them are very scarce. He died at Haarlem in 1681, in the forty-sixth year of his age.

RUYTER, MICHAEL, was born at Flessingen in 1607, went to sea at eleven years of age as a cabin-boy, and rose successively until he became a warrant-officer, and in 1635 was made captain. He served for several years in the East Indies, and in 1645 was appointed rear admiral. In 1647 he attacked and sunk off Salée an Algerine squadron.

In 1652 he was employed in the war against England, and while accompanying a large convoy of merchantmen he met the English fleet off Plymouth. The combat was not decisive, but Ruyter succeeded in saving his convoy. In 1653 he commanded a division under Van Tromp, and was beaten by Blake, but he had afterwards an advantage over the English near the Goodwin Sands. In 1655 he was sent to the Mediterranean to chastise the pirates of Algiers and Tunis. In 1659, being sent by the States-General to the assistance of Denmark against Sweden, he defeated the Swedish fleet, as a reward for which the king of Denmark gave him a title of nobility with a pension. In 1665 he fought against Prince Rupert of England with no decisive result, and in July of the following year he was beaten by the English. In June 1667 he entered the Thames as far as the Medway, and destroyed the shipping at Sheerness. In 1671, war having broken out between France and Holland, Ruyter had the command of the Dutch fleet which was to oppose the French and the English: he fought several battles in the Channel and the German Ocean without any important result. In 1675 he was sent to the Mediterranean, and fought a desperate battle with the French admiral Duquesne, off the eastern coast of Sicily, in which his fleet was worsted, and Ruyter had both his legs shattered. He effected a retreat into the port of Syracuse, where he died of his wounds in April 1676. A splendid monument was raised to him at Amsterdam, and G. Brandt wrote his Life, which was translated into French, folio, Amsterdam, 1690. Even Louis XIV. expressed sorrow on hearing of his death, saying that "he could not help regretting the loss of a great man, although an enemy."

RYCAUT, or RICAUT, SIR PAUL, was the tenth son of Sir Peter Rycaut, a merchant of London. The date of his birth is unknown, but he took his bachelor's degree in 1650 at Cambridge. In 1661 he attended the Earl of Winchelsea as secretary, when that nobleman went out as ambassador extraordinary to Constantinople. During that embassy, which lasted eight years, he made himself acquainted with the manners, customs, and religion of the Turks, and published the 'Capitulations, Articles of Peace, &c., concluded between England and the Porte in 1663,' and also 'The Present State of the Ottoman Empire, in Three Books, containing the Maxims of the Turkish Politie, their Religion, and Military Discipline, illustrated with Figures,' folio, London, 1668, 1670. He was afterwards appointed consul at Smyrna, which situation he held during eleven years, and exerted himself diligently in extending the commerce of England with the Levant.

On his return to England, Rycaut employed himself chiefly in literary occupations. He published 'The Present State of the Greek and Armenian Churches, Anno Christi 1678,' folio, London, 1680, and a 'History of the Turkish Empire from 1623 to 1677,' folio, London, 1680, which is a continuation of Knollys's 'History of the Turks,' and contains much information concerning the political resources of the Turkish empire and the manners of the Turks. It has been translated into almost all the languages of modern Europe, and has been several times reprinted.

In 1685 the Earl of Clarendon, then Lord-Lieutenant of Ireland, appointed Rycaut secretary of the provinces of Leinster and Connaught, and James II. created him a privy councillor of Ireland, a judge of the Court of Admiralty, and a knight. The revolution of 1688 deprived him of all his employments, but in 1690 he was appointed resident to the Hanse Towns. He then went to reside on the Continent, and remained there till 1700, when he returned to England for the benefit of his health, and died on the 16th of December in the same year.

Rycaut was a member of the Royal Society of London, and, in addition to his high character as a diplomatist, was celebrated for his knowledge of the learned languages and of the modern Greek, the Turkish, Italian, Spanish, and French. Besides the works already mentioned, Rycaut published a 'History of the Turks from the year 1675 to 1679,' folio, London, 1700; an English translation of Garcilasso de la Vega's 'Royal Commentaries of Peru,' folio, London, 1688; an English translation of Platina's 'History of the Popes,' folio, London, 1685; and an English translation of 'El Criticon' of Baltasar Gracian, folio, London, 1681.

RYLAND, WILLIAM WYNNE, one of the best English engravers of the 18th century, was born in London in 1732. He was apprenticed to S. F. Ravenet, a French engraver, who was settled in England. After the completion of his term of apprenticeship he went to Paris, and studied there chiefly under Le Bas for five years. He did not confine himself however to engraving, but applied himself also much to drawing, under Boucher, a painter of eminence, and after whom he engraved, besides some others, an excellent plate of Jupiter and Leda; he also etched some plates after Oudry while at Paris, illustrating the fables of Fontaine.

Soon after his return to England Ryland was appointed engraver to George III., with a pension of 200*l.* per annum. He engraved two portraits of George III. after Ramsay, and one of Queen Charlotte holding the Princess Royal on her lap after Cotes. "It is greatly to be lamented," says Strutt, in his Dictionary of Engravers, "that Ryland's engagements in the mercantile line as a printseller, deprived him of so considerable and so precious a part of his time, and prevented his pursuing the arts with that alacrity the strength of his genius required, which seemed formed for great and extensive exer-

tions. The works which he has left behind him abundantly prove that he had sufficient knowledge and judgment to have carried them to great perfection." These last words refer to the sad event which abruptly put an end to Ryland's labours and life at once, but which Strutt, who must have known Ryland well, does not more particularly allude to. He was executed for forgery in the prime of life, July 23th 1783.

Strutt, whose work was published only two years after Ryland's execution, seems to have abstained, from delicacy probably towards his widow, from a more particular notice of the disgraceful termination to his brother engraver's otherwise successful career. As this case is not known and as Ryland persisted in his innocence to the last, it may be here briefly related as the facts appeared on the trial:—Ryland appears to have been a discounter of bills, and that he was otherwise commercially engaged as a printseller, has been already noticed. He had once failed in this business, but he afterwards honourably repaid all his creditors in full, though not bound to do so by law. In the spring of 1783 the agents and servants of the East India Company in London appear to have detected several forgeries of their bills, and suspicion attached to Ryland, apparently in more than one case. He received however intimation of his approaching arrest, and by the advice of his wife concealed himself, whereupon the East India Company immediately offered a reward for his detection. He had concealed himself in the house of a shoemaker at Stepney, under the name of Jackson: having however given the man some shoes to mend, the shoemaker discovered the real name of his lodger, and gave notice to the police. When Ryland found that he was discovered, in a fit of despair he attempted to cut his throat; the attempt failed, but he seriously injured himself. A true bill was found against him by the grand jury, June 5, and he was tried at the Old Bailey July 26, before Judge Buller. The specific charge against him was for forging and uttering knowing to be forged a bill of 210*l.* on the East India Company. The case for the prosecution was this: Ryland had uttered or negotiated two bills on the East India Company for 210*l.* and of the same date, the original bill in May 1782, and the forged bill in November of the same year. The two bills were so much alike that none could swear which was the true bill, except by two small holes through which a needle and thread had passed; and, what was of chief importance, the paper-maker gave evidence to the paper of the other bill being made after the date of the bill. The first bill had been fairly negotiated, but the party from whom Ryland asserted that he had received the second, a Mr. Hagglesstone, was nowhere to be found. These facts and the circumstances of his flight and attempted suicide were urged against him by the counsel for the prosecution. Ryland made his own defence, but owing to the soreness of his throat from his recent attempt, it was written, and read by the clerk of the court: the following were its concluding words, as reported in the 'Morning Herald' of July 28:—"The prosecution has endeavoured to substantiate my guilt by my flight; but let them figure to themselves the fears, the dread, the horrors, of an honest mind, pursued by officers of justice, to take my life, if I could not prove my innocence; let them reflect on the tears, the entreaties and prayers of a fond, loving, and beloved wife, and then conclude my guilt from my flight. They have also presumed to drag into evidence my attempt on my own life. I confess the attempt with shame, horror, and remorse; driven into a state of insanity, how then will they, how can they, torture insanity into a proof of my guilt! Two bills, one a good one, one a bad one, have been attempted to be proved in my possession; supposing that to be true, can any man say either is the forged one? Mr. Holt, from his infirmity, may easily make a mistake; and where then is any forgery? I cannot think that the court and jury will sacrifice my life to presumption, and, where there is a possibility of innocence, take it away on groundless suspicions." He was found guilty of uttering the bill knowing it to be forged.

After the verdict was pronounced, which he bore with the greatest calmness, he merely observed—"I dare not challenge the justness of my verdict: I am however conscious of my innocence; and I hope that my life will be preserved by the royal clemency of my sovereign, on whose bounty it has long subsisted." He heard his sentence pronounced without being moved, and retired from the court as if unconcerned in the proceedings. He was executed at Tyburn on the 29th of August, about twelve o'clock, in company with five other convicts, four of whom were executed for highway robbery and burglary, the fifth for forgery. The execution was delayed some time by a violent thunder-storm. A white handkerchief was bandaged round the cap of Ryland. The curiosity of the public was so great to witness the execution of this unfortunate man, that as much as ten guineas were paid for a single room which commanded a view of the barbarous and disgusting exhibition: so great a concourse of people had not met for a similar purpose since the execution of Dr. Dodd six years previously.

Character and probability were much in favour of Ryland's innocence, though circumstantial evidence was against him. He was wealthy, according to his own account. Besides the salary of 200*l.* per annum as engraver to the king, he exercised a very lucrative profession, possessed a great stock in trade, and had a large property in the Liverpool water-works; and many witnesses bore testimony to his high character. Strutt says of him—"He was a man respected and beloved by all that were acquainted with him; for few men in private

life ever possessed more amiable qualities than he did. He was a tender husband, a kind father, and a sincere friend. He frequently straitened his own circumstances to alleviate the sorrows of others; for his heart was always open to receive the solicitations of distress."

Ryland introduced chalk-engraving (lines composed of dots) into England, and in the latter years of his life devoted himself exclusively to engraving in this style, in which he had no equal, but chiefly, except a few drawings by the old masters, after the works of Angelica Kauffmann, a circumstance which is to be regretted, as the works of that lady have little to recommend them to the lovers of art. Ryland engraved twenty-four prints after Angelica, and one of these, 'Edgar and Elfrida,' a large plate, which was finished by Sharp for the benefit of Mrs. Ryland, is one of his principal works. 'King John ratifying the Magna Charta,' a large plate after Mortimer, and in a similar style, was generally bought as a companion to it. Ryland left this plate also unfinished, and it was completed by Bartolozzi, likewise for the benefit of his widow. It is his best plate in this style; but the best of these chalk engravings have a very inferior effect to etchings, or line and mezzotinto engravings; the style was, however, like the insipid drawings of Cipriani, much in vogue in the time of Ryland and Bartolozzi.

As an etcher, or where the needle and graver are combined, Ryland was also excellent. The prints which he engraved in France were executed in this style, and Watelet terms his execution in this style most picturesque, and adds that one would suppose his etchings to be the work of a painter. The chalk manner is exactly in its place in imitations of chalk drawings, of which there are no better examples than Ryland's own in the fine Collection of Drawings published by Charles Rogers, as the two of St. Francis, after Carlo Maratti and Guercino, and many others. This work is entitled 'A Collection of Prints in imitation of Drawings; to which are annexed Lives of their Authors, with explanatory and critical Notes, by Charles Rogers,' &c., 2 vols. folio, London, 1778; containing in all 116 prints, some of considerable size, of which 57 are by Ryland, besides the admirable mezzotinto portrait of Mr. Rogers at the commencement of the work.

RYMER, THOMAS, the learned editor of the great collection of documents relating to the transactions of England with foreign powers, popularly known as 'Rymer's Fœdera,' was one of the many sons of Ralph Rymer, of the neighbourhood of Northallerton, who had rendered himself obnoxious to the Royalists in the Commonwealth times in his office of Sequestrator, and becoming implicated in the northern insurrection of 1663, was thereupon executed. Thomas was born in 1638 or 1639, and educated under an excellent schoolmaster at the grammar-school of Northallerton, where he was a class-fellow with the learned Dr. George Hickes. He was removed to Sidney College, Cambridge, and was entered of Gray's-inn in 1666.

He does not appear to have attained any eminence in the law. He rather devoted himself to polite literature, till he was named the historiographer royal, and appointed editor of the 'Fœdera.' His first publication is a play, published in 1677, entitled 'Edgar, or the English Monarch.' This was followed in the next year by his letter to Fleetwood Shepherd, 'The Tragedies of the Last Age considered and examined by the Practice of the Ancients and by the Common Sense of all Ages.' In 1683 appeared his translation of the *Life of Nicias*, by Plutarch, which is found in the collection of the 'Lives translated into English by several Hands.' In 1684 he published a tract on the antiquity, power, and decay of Parliament, which was reprinted in 1714, on occasion of the expulsion of Richard Steele, Esq., the member for Stockbridge. In 1693 he published 'A short View of Tragedy; its Original Excellency and Corruption: with some Reflections on Shakspeare and other practitioners for the Stage.' This is the work in which he attacks some of Shakspeare's tragedies in a manner ludicrously absurd. In 1694 appeared his translation of M. Rapin's 'Reflections on Aristotle's Treatise of Poesie.' There are other minor tracts by him, among which is probably to be reckoned the 'Life of Thomas Hobbes,' printed 'apud Eleutherium Anglicum sub signo Veritatis, 1681.'

On December 23, 1692, he was made historiographer royal, a post which had been held by Shadwell and Dryden. The salary was 200*l.* per annum. There was at that time a scheme for publishing a corpus of the documents which remain connected with the transactions between England and other states. It was intended that it should be a large and comprehensive work, honourable to the English nation, and useful to the historical inquirers, not only of England but of all other countries. The patrons of this magnificent design were Montagu, who was afterwards Earl of Halifax, and Lord Somers. The execution of it was committed to Rymer. His duties were twofold: first, to collect the instruments themselves, which were to be found chiefly in the chronicles and in the depositaries of public records, particularly the Tower of London and the Chapter-House at Westminster; secondly, to print accurate copies of them. The first volume appeared in 1703, and it was followed by others in quick succession, the later volumes being carried through the press by Sanderson, who had assisted Rymer almost from the beginning.

The work did not disappoint the expectations of the public. It entirely changed the face of the histories of our own country, as may be seen by Rapin's History, and it was hailed with great satisfaction by all the historical writers of Europe. Large as the work was, there have been three editions of it. A fourth was undertaken by the

Commissioners on the Public Records, in which it was proposed to incorporate other documents, which had been discovered since the time of Rymer. This edition extends only to the close of the reign of Edward III. There are in the British Museum a great number of transcripts of documents made under Rymer's direction not used in his work.

Notwithstanding his appointment of historiographer, and whatever remuneration he might receive for his labours on the *Fœdera*, Rymer became exceedingly poor in the latter part of his life. He died December 14, 1714, in Arundel-street, in the Strand, and was buried in the church of St. Clement Danes.

RYSBRACK, RYSBRAECK, or RYSBRECHTS, PETER, was born at Antwerp, in 1657, and studied landscape painting under Francis Miló, whom he accompanied to Paris. He followed the style of Poussin, in imitating whom he was pre-eminently successful. Notwithstanding large offers and flattering encouragement to remain in France, he returned to his native city, and in 1713 was made director of the Academy there. The landscapes of Rysbrack are distinguished by grandeur of style, which, though founded on an imitation of the admirable productions of Nicholas Poussin, possess sufficient originality to secure him from the imputation of plagiarism. Indeed he painted in the spirit rather than copied the works of that great artist, though there is a want of variety in his pictures, which places them, in the estimation of connoisseurs, far below those of Poussin. Rysbrack's colouring is harmonious, his touch is bold and free, and he possessed great facility of execution. He died in 1716.

RYSBRACK, MICHAEL. The date of the birth and the birth-place of this distinguished Flemish sculptor are differently given by different writers; but Charles Rogers, the publisher of the *'Century of Drawings,'* &c., who was well acquainted with him, states that he was born at Antwerp, June 24, 1693. He was the son of the landscape-painter Peter Rysbrack, who, after he had given his son some instruction in design, placed him in 1706 with the sculptor Michael Vander Vorst, with whom he remained six years.

In 1720 Rysbrack came to London, and distinguished himself for his small models in clay. He was the first sculptor who was extensively employed in England, and he spread a general taste for the art over the country by his fine monumental works. His progress in London was at first slow, and his first work which attracted notice was a bust of the Earl of Nottingham. He was for some time engaged by Gibbs, who contracted with the original parties for monuments, for which he on his part contracted with Rysbrack, greatly to his own advantage. For instance, Gibbs received from Lord Oxford 100*l.* each for the statues on Prior's monument in the south transept (or Poet's Corner) in Westminster Abbey, while he gave Rysbrack only 35*l.* each. Rysbrack however soon became aware of his own merit, and shook off all dependence on Gibbs. Engagements crowded upon him, and there was not a work of sculpture of any consequence undertaken in England that was not intrusted to Rysbrack. When men found, says Walpole, that there was a man capable of furnishing statues, the taste for monuments was much improved and greatly spread.

Rysbrack, unlike most of the artists of his age, studied exclusively nature and the antique; he had no respect for the works of his great countryman Rubens, and those of Rembrandt he would not look at, in which he was of course actuated wholly by the feelings of a sculptor, form and character being his exclusive study. He was a most industrious sculptor: fine works are to be seen by him in many parts of England, but especially in Westminster Abbey, at Blenheim, at Stourhead, and at Bristol. In few sculptors' workshops has there been more activity than there was in those of Rysbrack in Vere-street, Oxford-street, during about forty years of the half century that he dwelt in England, though latterly, through his successful rivals Scheemaker and Roubiliac, his occupation sensibly diminished.

Rysbrack's busts were very numerous, and include those of many distinguished characters. His first great public work was the bronze equestrian statue of William III., which was made for the city of Bristol, and erected in Queen's-square in 1733. Scheemaker also competed for this statue, and his model was thought so excellent that he was presented with 50*l.*, though it was rejected for the design of

Rysbrack, who received 3000*l.* for it: Walpole says 1800*l.* The monument to Sir Isaac Newton in Westminster Abbey, which was exposed in 1731, was executed by Rysbrack from a design by Kent. One to Mrs. Oldfield, in the cloisters, put up the year before, was apparently his first independent monument in the abbey.

In 1735 he finished a colossal statue of George II. for the parade of Greenwich Hospital, at the expense of Sir John Jennings, the then governor: it was cut out of a single block of marble weighing eleven tons, which had been captured from the French by Sir George Rooke. He made also the statue of George II., which was in the old Royal Exchange, London. He obtained however most reputation by his monument to John, Duke of Marlborough, and his duchess in the chapel at Blenheim. They are represented with their two sons, who died young, supported by Fame and History; in the lower part is a basso-relievo of the surrender of Marshal Tallard: the style is however very far removed from the purity and severity of monumental sculpture of a high order. At Blenheim also, in the library, is a beautiful marble statue of Queen Anne: it was erected in 1726. In Christchurch College, Oxford, there is a statue of Locke by Rysbrack, executed in 1757. This college contains also some busts of distinguished members by Rysbrack. Besides what have been already mentioned there are the following monuments by him in Westminster Abbey:—to Admiral Vernon, and Richard Kane, governor of Minorca, in the north transept; to James, Earl Stanhope, in the north aisle; to John Friend, M.D.; and John Methuen, in the south aisle; to Sir Godfrey Kneller, in the nave; to John Gay, Nicholas Rowe, John Milton, and Ben Jonson, in the south transept, or Poet's Corner; and one to Daniel Pulteney in the cloisters.

The erection of Shakespere's monument by Scheemaker, in Westminster Abbey, is said to have greatly obscured the reputation of Rysbrack; but it only stimulated the industrious sculptor to make still greater exertions. This rivalry was the cause of his making his Palladio, Inigo Jones, and Flaminio, at Chiswick; and subsequently his masterpiece, the Hercules, at Stourhead, the seat of Sir Richard Colt Hoare. This Hercules is a species of historical figure, a record of the English gymnasium or amphitheatre for boxing, an institution which was put an end to, as the principal gymnasiasts generally ended their career by being hanged. The figure was made for Henry Hoare, Esq., who built a temple expressly for it. It is of the heroic size, seven feet high, and cost Rysbrack three years' labour. The head is copied from the Farnese Hercules; the limbs are taken from several different English frequenters of this gymnastic amphitheatre. 'The arms,' says Walpole, 'were Broughton's; the breast a celebrated coachman's, a bruiser; and the legs were those of Ellis the painter, a great frequenter of that gymnasium.'

There are many other statues by Rysbrack—as a Flora from the antique, at Stourhead; the Duke of Somerset, at Cambridge, presented by his daughters the Marchioness of Granby and Lady Guernsey; Charles Duke of Somerset and his Duchess, in Salisbury Cathedral; Sir Hans Sloane, in the botanical garden at Chelsea, and his bust in the British Museum; Lady Folkestone, Colleshill, Berks; Lady Beborough, Derby; the second, third, and fourth Dukes of Beaufort, at Badminton, Gloucestershire; Dr. Radcliffe, at Oxford; John Willet, Esq., Merly House, Dorsetshire; a statue of Charles I., for George Selwyn; and the following busts:—Pope, Gibbs, Sir Robert Walpole, Duke and Duchess of Argyle, Lord Bolingbroke, Wootton the landscape-painter, Martin Folkes, Ben Jonson, Butler, Milton, Cromwell, the heads in the Hermitage at Richmond, and those of the English Worthies which were executed for the Elysian Fields at Stowe: he made also a good bust of himself. Notwithstanding his industry, Rysbrack was not rich, and when at the age of seventy he gave up his profession, he made a sale of his principal effects—his remaining works and his collections of prints, pictures, drawings, marbles, casts, models, &c., including a large collection of his own drawings, which, says Walpole, were conceived and executed in the true taste of the great Italian masters. The chief amusement of the last three years of his life was in making such drawings in bistre, and many were sold at two auctions of his effects which took place after his death. He died January 8, 1770.

## S

SAAD-ED-DEEN (KHOJA SAAD-ED-DEEN MOHAMMED EFFENDI), the most celebrated of the Turkish historiographers, was born in the early part of the 16th century of our era. Hassan-Jan, his father, a Persian by birth, held a post in the household of Sultan Selim I., and was highly esteemed by that ferocious monarch, whom he attended in his last moments. His son Mohammed received his education among the pages of the imperial palace, and having devoted himself to the study of Moslem theology and jurisprudence, became a muderris, or professor in the college attached to the great mosque of St. Sophia. The talents and learning which he displayed in this capacity gave him high celebrity, and he was appointed by Selim II., in 1573, khoja, or preceptor to his son Mourad, the heir apparent, who then held the government of Magnesia. The death of Selim, in December 1574,

called Mourad to the throne; and Saad-ed-deen was nominated cadhiasker, or military judge; but he continued to retain almost unlimited influence over his imperial pupil, who had recourse to his advice in matters of government so constantly as to excite the jealousy of the vizirs; and an attempt was made to ruin him by representing the erection of an astronomical observatory, which the sultan had founded at his instigation near Top-khana, as an evil omen for the stability of the empire. But though the observatory was demolished by the superstitious fears of Mourad, the favour with which he regarded Saad-ed-deen was unimpaired; and Mohammed III., who succeeded in 1595, continued to entrust the confidential adviser of his father with the management of the most secret diplomatic relations of the empire. The Khoja-Effendi (as Saad-ed-deen is fre-

quently termed by Oriental writers) even attended Mohammed in the Hungarian campaign of 1596; and the victory of Keresztes is ascribed in a great measure to his exhortations, which prevented the sultan from abandoning the field at the moment of extreme peril. He however incurred a temporary disgrace immediately afterwards by his advocacy of the cause of the fallen vizir Cicala; but he was speedily restored to favour, and on the death of the Mufti Bostan-Zadah, March 1598, was raised to the highest ecclesiastical dignity by the sultan, in spite of the opposition of the Grand-Vizir Hassan, who proposed the elevation of the celebrated poet Baki. He did not however long survive his exaltation, dying suddenly in the mosque of St. Sophia, as he was preparing for prayers on the anniversary of the birthday of the prophet, October 2, 1599 (not 1600, as stated in the 'Biog. Univ.'), A.H. 1008, and was interred in the cemetery of the mosque of Ayub, whither his remains were borne by his four sons, two of whom at subsequent periods also held the dignity of mufti.

The great historical work of Saad-ed-deen, composed by order of Mourad III. (who created for the author the new office of Shahnamahdj, or imperial historiographer), is entitled 'Tad-jal-Towarikh,' or the crown of histories, and gives a full and copious narrative of the history of the empire, from its foundation in 1299 by Othman, to the death of Selim I. in 1520; the materials are principally drawn from the previous works of Neshri, Moulana-Edris, and Kemal-pasha-Zadah; but its chief merit, in the estimation of the Turks, consists in the florid and elaborate beauty of the diction, in which the author is certainly unrivalled by all other Turkish historians. Sir W. Jones has pronounced that "for the beauty of its composition and the richness of its matter, it may be compared with the finest historical pieces in the languages of Europe;" but the meaning is too often concealed by a cloud of rhetorical tropes, and it is impossible to forget in the perusal of the work that it is the production of a courtier. It is singular that this valuable work has never yet been printed at the imperial press of Constantinople; but manuscript copies are frequent in European libraries, and an Italian version was published by the Ragusan Vincenzo Bratutti (4to, part i., Vienna, 1646; part ii., Madrid, 1652), under the title 'Cronaca dell' Origine e Progressi degli Ottomani, composta da Saidino Turco, e tradotta in Italiano;' small portions have also been translated by Kollar, and by Grangenet de la Grange. A Turkish abridgement of the work, with a continuation, was published in 1696 (A.H. 1108), with a dedication to Sultan Mustapha II., by Saadi-Effendi of Larissa; and the resemblance of name has often led to this work (which served as the basis for the inaccurate compilation of Cantemir) being confounded with the great history of Saad-ed-deen. (See Von Hammer, in 'Journal Asiatique,' January 1824.) Besides this great work, Saad-ed-deen was the author of the 'Selim-Nameh,' a history of Selim I., or rather a collection of anecdotes of that prince, related to him by his father Hassan-Jan; this compilation, which is divided into fourteen sections, is valuable for its authenticity. His descendants appear to have flourished for several generations, and to have inherited the talents of their ancestor; two of his sons, as already noticed, Mohammed-Effendi and Assaad-Effendi, attained the rank of mufti; and a grandson or great-grandson of the latter, Mollah-Fayez, is mentioned as an eminent legist by Sheikhi, who notices his death in 1724.

(Von Hammer, *Histoire de l'Empire Ottoman*; D'Herbelot; *Bibliographie Universelle*; *Journal Asiatique*.)

SAADI, or (as his name is written in full in Arabic or Persian) SHEIKH MOSLIM EDDIN SAADI ALSHIRAZI, the first part of the name being a title of honour, the two next words his epithet, and the last expressive of his being a native of the city of Shiraz, where he was born in the year of the Hegira 571 (A.D. 1175-76). He is probably better known by name to the European reader than any other poet or writer of the east except Mohammed; and while this European reputation may be in some measure attributed to his renown amongst his own countrymen, a circumstance which would naturally recommend his work for perusal and translation to the few Persian students of two hundred years back, it may be also in a great degree ascribed to the simplicity and elegance of his style, so like that of the best periods of Christian literature, and so unlike that of the great mass of Persian writers. Saadi led the life of a dervish, or wandering monk, and passed most of his early years in travelling from one country to another. In the course of these journeys he was taken by the Crusaders and put to labour on the fortifications of Tripoli. He was redeemed from this slavery by a rich merchant, who afterwards gave him his daughter in marriage, with a dowry of an hundred pieces of gold. This is alluded to in the 'Gulistan' (tale xxxi. of ch. ii., p. 99 of Gladwin's translation, London, 1808). The lady sorely exercised the poet's patience. "Once," says he, "she reproached me, saying, Art thou not he whom my father redeemed from captivity amongst the Franks for ten dinars? I answered, Yes, he ransomed me for ten dinars, and put me into your hands for a hundred." A story of a livelier character is told of his meeting with a brother poet, Hemám of Tabriz, who, ignorant of the name, and knowing only the birthplace of his companion, held out to him the bottom of a cup (the Shirazians were noted for their early baldness), and asked, "Why are the heads of the Shirazians like this?" The dervish turned the hollow of the cup to Hemám, and asked, "Why are the heads of the Tabrizians like this?" Hemám asked his companion if he knew any of the verses of

Saadi, and the dervish repeated some of the most beautiful. He then inquired, "Do they make much esteem there of the poems of Hemám?" Saadi elegantly quoted a couplet of his companion's:—

"Between the object of my love, Hemám, and me, a veil is drawn,  
But it is time the veil should be drawn back, and we enjoy the sight of one another."

and thus the illustrious poets were made acquainted.

Another anecdote shows, in the fanciful language of Persian imagination, the high esteem in which the writings of Saadi were held even during his lifetime. Indeed he was fortunate enough to add a large share of this enjoyment of fame to the renown which 600 years have not diminished. A holy man of Shiraz, says the story, dreamed that he heard all the angels of heaven singing a verse which he could not understand, but which he was told was a couplet of Saadi's and that it would be sung in heaven for a year to come. In the morning he went to the cell of the now recluse poet, and found him repeating the distich:

"On the green trees the clear eye of the wise beholdeth  
In every leaf a book of the wisdom of God."

Saadi died in 1291, at the age of 116 years, having spent, it is said, thirty years in travelling and in military service, during which, his wanderings reached as far as India on one side, and Asia Minor, or perhaps Eastern Europe, on the other; thirty years in religious solitude, digesting the results of his life of observation; and the twelve last years of his life in putting into a permanent form the fruits of the preceding sixty. During this long life he performed the pilgrimage to Mecca fifteen times; the first time in the company of his teacher, Abdolkadir Ghiláni. He lived under the patronage of the Atabeg princes, Saad Ben Zenghi, and his successor, Abubekir Ben Saad. From the former of these princes, his father, who was in the royal service, gave his son the name of Saadi: this in the East is a not unusual mode of naming both men and books, and the name is often so contrived as to form a sort of 'jeu de mots.'

The works of Saadi, collected by Ahmed Nasik Ben Sesán, consist of the *Gulistan*, *Bostan*, *Gazels* (or odes), *Kasaid* (or elegies), *Mokataat* (fragments), *Rubayat* (quatrains), and essays of various kinds in prose. Of all these the best known are the *Gulistan* and the *Bostan*. The former is a collection of stories, in prose, but intermixed with verses of the author's own composition, or borrowed from the writings of others, a mode of writing which the Eastern imaginative writings much affect. The *Gulistan* is divided into eight chapters: on the morals of kings; on the morals of dervishes; on the excellency of contentment; on the advantages of taciturnity; on love and youth; on imbecility and old age; on the effects of education; and rules for conduct in life. The first seven chapters consist chiefly of moral stories, some of them apparently from real history, others fables, each in some degree bearing upon the subject of the chapter, and having its moral interwoven in its texture. The last chapter is rather a collection of apophthegms, though a part of this also is narrative. These stories are not connected by a general thread of narrative, as is the case with most oriental collections (the reader will remember the general and subordinate stories which connect the histories of the Arabian Nights and the Fables of Pilpay); they follow one another without any link, except that of their allusion to a common subject. Of this book there have been many translations: into French by Du Ryer, who was French consul at Alexandria, Paris, 1634; by Du Ryer, from the original by Gaudin, 1789; and by Semelet, Paris, 1834; into German by Olearius, who, in his preface, acknowledges the assistance of an old Persian translator named Hakwird, and mentions an earlier German translation made from the French of Du Ryer, and soon after the appearance of the latter. The translation is spirited, and so are the copper-plates. This version was published at Sleswig in 1654, and a Dutch translation from the German appeared at Amsterdam in the same year. Olearius also translated the *Bostan* (a somewhat similar collection to the *Gulistan*, but all in verse) into German. A recent German version is that of K. H. Graf, Leipzig, 1846; who also made a translation of the *Bostan* (*Lustgarten*), 2 vols. 1850. The *Gulistan* was translated into English by Gladwin, London, 1808; by Ross for the Asiatic Society; and by Eastwick, in prose and verse, Hertford, 1852. This is an excellent translation, and a beautiful specimen of typography.

The whole works of Saadi, in the original Persian and Arabic, were printed at Calcutta, in 2 vols., small folio, edited by Harrington (1791). The text of the *Gulistan* appeared first in the edition of Gentius, Amsterdam, accompanied by a Latin translation and notes. Gladwin published the text at Calcutta in 1806, which was reprinted in London in 1809. The text, with the translation in parallel columns (by Jas. Dumoulin), was printed at Calcutta in 1807, and there have since been more than one lithographed edition, one of which, we believe, has the *Bostan* on the margin—a form in which the two works often appear in manuscripts. Professor Falconer has given the Persian student an elegant selection from the *Bostan*, lithographed, containing about one-third of the whole work, and has also inserted in the 'Asiatic Journal' several excellent versions of detached stories, accompanied by the text, as collated from several copies, and by critical notes. Dr. A. Sprenger published an edition with punctuation and vowel marks at Calcutta, 1851; and Mr. Eastwick printed an edition collated with several original manuscripts, and accompanied with a vocabulary, Hertford,

1850. The Gulistan is one of the best text-book for learning Persian. A good Life of Saadi is given in the introduction to Harrington's edition of his works (a translation from the Persian of Dowlet Shah); a briefer notice in D'Herbelot; and one of some length in Von Hammer's 'History of the Elegant Rhetoric of Persia' ('Geschichte der Schönen Redekünste Persiens.')

SAAVEDRA, MIGUEL DE CERVANTES, the celebrated author of 'Don Quixote,' was born at Alcalá de Henares, on Sunday, the 9th of October 1547, of an ancient family originally from Galicia, which had for some time been established in Castile. His grandfather, Juan de Cervantes, was corregidor of Ossuna. His mother belonged to the illustrious family of Barajas. Very little is known of the early life of Cervantes, except that he received his first education at the place of his birth, and gave very early proofs of talent. Having attained the proper age, Cervantes repaired to Salamanca, where he entered himself as a student at the university, and remained two years. He then went to Madrid, where his parents placed him under the tuition of Juan Lopez de Hoyos, a learned theologian, who filled the chair of belles-lettres in that city. Under him Cervantes seems to have made considerable progress. He himself informs us ('Viage al Parnaso,' p. 54) that he composed several romances or ballads, besides a pastoral called 'Fleusa,' and when, in 1569, his master published a collection of poems on the death of Isabella of Valois, wife of Philip II., there appeared, among the rest, two poetical compositions by Cervantes, whom he calls "our dear and beloved pupil."

In 1568 Cervantes entered the household of Cardinal Aquaviva, then at Madrid, and accompanied that prelate on his return to Rome. He remained with him one year, after which he entered the army, and served as a volunteer under Marco Antonio Colonna, the commander of the papal forces against the Turks. He greatly distinguished himself at the battle of Lepanto (October 7, 1571). Though suffering at the time from intermittent fever, he took an active part in the combat, and received three arquebuse wounds, two in the breast, and one in his left hand, which maimed him for life. He continued to serve under Don Juan of Austria, and his successor in command, the Marquis of Santa Cruz, until 1575, when he revisited his native country, and spent some time at Madrid among his friends and relations. Having early in 1576 obtained a command in a regiment about to be sent to the Low Countries, Cervantes embarked with his elder brother Rodrigo, also a soldier, on board the Spanish galley *El sol* (the sun). On the 26th of September however, the galley was suddenly surrounded by an Algerine squadron, under the command of Arnaut Mami, who, after a most obstinate defence, boarded and took it, and carried his prize into Algiers. The crew and passengers were sold as slaves. Cervantes, who had fought with desperation on the boarding of the galley, was reserved by Mami for himself.

The numerous interesting details which Cervantes has given us in his novel 'El Cautivo' (the captive), and which have also come down to us from undoubted and impartial sources, display so much gallantry and magnanimity on his part, that they cannot be read without calling forth our admiration. After many bold but unsuccessful attempts to regain his liberty, by which he ran great risk of losing his life, Cervantes was redeemed in 1580 by the Fathers of Mercy, established for that purpose at Algiers, who paid to Hassan Aga, then his master, the enormous sum of 500 gold ducats, which had been raised among his friends and relatives. On his return to his native country, Cervantes, being destitute of all resources, again resumed the military profession, and served in three successive expeditions against the Azores. It was not till his return to Spain in 1584 that he appeared as an author, having soon after published his 'Galatea,' a pastoral romance in prose and verse, in imitation of 'La Diana' of Montemayor—a species of composition much in fashion at that time. In this romance Cervantes personified himself, as well as the lady of his love, Doña Catalina Palacios y Salazar, whom he married in the same year (1584) under the names of Elicio and Galatea. He next devoted all his attention to the composition of dramas, of which he wrote upwards of thirty, and which, he informs us, were all acted with considerable applause. These are however all lost with the exception of two, 'El Trato de Argel' ('Algerine Dealing'), and 'La Numancia.' But notwithstanding his theatrical success, Cervantes must have been in bad circumstances, since in 1588 we hear of him at Seville, where he filled the office of assistant-purveyor to the Indian fleets. That he was not content with his situation, and that it was an insignificant one, would appear from the fact of his having shortly afterwards, in 1590, made an application to be employed in the New World. At length, the purveyorship having been abolished, and his office suppressed in 1596, Cervantes earned a scanty livelihood by becoming agent to various municipalities, corporations, and wealthy individuals. We have few traces of the mode in which he exercised his pen during this interval, and with the exception of two burlesque sonnets ('estrambotes'), one of which was intended to ridicule the ostentatious arrival of the Duke of Medina at Cadiz, after this town had been plundered and abandoned by the Earl of Essex, we hear of no other productions of his genius. It is probable however that during his stay at Seville he wrote some, if not all, of his 'Novelas Exemplares,' which he subsequently published.

From 1598, when he left Seville, to 1602, when we hear of him at Valladolid, there is a gap in the history of this great man, which all the diligence of his biographers had hitherto failed in filling up, it not

being known where he resided or what pursuit he was engaged in. Some indeed are willing to supply the deficiency by supposing him to have been engaged as tithe-collector in La Mancha, and they add, that whilst fulfilling the duties of his office he was put in prison by the alcaide of Argamasilla, a small town of that province, and that he thus wrote the first part of his 'Don Quixote' in confinement. The accuracy with which the country of La Mancha and the manners and customs of its inhabitants are described in that work, is certainly in favour of the conjecture that he resided some time there; but Navarrete ('Vida de Cervantes,' p. 95) has shown that the report of his imprisonment rests on no other foundation than vague tradition. However this may be, Cervantes was at Valladolid in 1602. Three years after he published the first part of his 'Don Quixote,' which he dedicated to Don Alonso Lopez de Zuñiga y Sotomayor, seventh duke of Bejar. Though the work excited no great attention at first, it suddenly came into vogue, and was eagerly read by all classes of society. No less than four editions of it were printed in various parts of the Peninsula within the first year after its appearance (1605); two at Madrid, one at Valencia, and another at Lisbon. Its fame spread rapidly to all the neighbouring countries. But notwithstanding this enthusiastic reception of his work, Cervantes continued poor, and he was accordingly engaged by the Duke of Lerma, the minister of Philip III., to write an account of the festivities, bullfights, religious ceremonies, and so forth, with which Lord Howard, ambassador of James I., was received at Valladolid in 1605. On the return of the court to Madrid in 1606, Cervantes followed it, and he continued to inhabit that city to the end of his life. In 1606 he brought out a correct edition of the first part of 'Don Quixote,' and in 1613 his 'Novelas Exemplares' (Exemplary Tales), twelve in number, by which his literary reputation was greatly increased. In 1614 he published his 'Viage al Parnaso' (Journey to Parnassus), a work which cannot properly be ranked in any particular class of literature, but which, next to 'Don Quixote,' is the most exquisite production of its immortal author. This work however being intended as a satire upon the bad poets of his time, some took offence at it, and became Cervantes' bitterest enemies. One, among others, published under the assumed name of Alonso Fernandez de Avellaneda, a continuation of 'Don Quixote,' full of invective and abuse (Tarragona, 1614). This probably hastened the publication of the second part, which was sent to press early in 1615, with a dedication to his patron the Conde de Lemos. His other works are a collection of comedies and 'entremeses' (interludes) written in the fashion of the new school introduced by Lope de Vega, but which were never acted ('Mad., 4to, 1615); and a novel entitled 'Persiles y Sigismunda,' composed in a style very different from that of his other works, and certainly the least successful of all his productions. (Madrid and Barcelona, 1617.)

Cervantes died at Madrid on the same day as his great contemporary Shakespere, on the 23rd of April, 1616, being then in his sixty-ninth year. He was buried without the least pomp in the convent of the nuns of the Trinity in the Calle del Humilladero, where his daughter Doña Isabel had four years before taken the veil. But the nuns having removed to another convent in the Calle de Cantaranas, the old one was pulled down, and the remains of Cervantes were lost. Within the last few years however two monuments have been erected in Madrid to the memory of this great man: one, in the Plaza de las Cortes, consisting of a beautiful bronze statue upon a square pedestal of granite, on the sides of which are bas-reliefs representing subjects taken from 'Don Quixote'; the other is his bust in white marble over the door of the house in the Calle de Fraccos, where he lived and died.

His works have been too often analysed to render it necessary here to dwell upon their merits. His first publication, 'Galatea,' is beautiful in its spirit, interesting and pleasing in its details, but not original; as a work, it is cast in the same mould as other pastorals written before his time. Cervantes had imagination and invention; he always wrote with purity, frequently with elegance; but he was not a poet; he wanted that severe taste, that power of concentration and perfect ear for harmony which form poetry. His plays therefore are, generally speaking, bad. But his master-work, 'Don Quixote,' is perfect in all its parts. The conception is admirable and the author shows in every page a highly philosophic mind, the noblest sentiments expressed with inimitable simplicity, and a perfect knowledge of the human heart. Of his 'Novelas' or 'Tales,' it may be said that they are not only interesting and amusing, but perfectly moral. The 'Voyage to Parnassus' is in many respects a master-piece of art, and the weapon of satire is handled dexterously, but without ill nature.

The Life of Cervantes has been written at great length by some of the most eminent Spanish authors: Father Sarmiento, Mayans, Los Rios, Fernandez, and Navarrete. The last has spared no trouble in investigating the most minute incidents of the life of Cervantes, and has produced a work which, accompanied as it is by many original documents, leaves nothing to desire. The editions of 'Don Quixote,' published in and out of Spain since the death of the author, have been so numerous as to render it almost impossible to give anything like a correct list of them. We shall therefore mention only a few of the best:—Madrid, 4 vols. 4to, 1780, with engravings on copper; London, by Bowle, 6 vols. 4to, 1781; Madrid, by Pellicer, 5 vols. 8vo, 1797;

Madrid, by the Royal Academy of History, 5 vols. 8vo, 1819; and the edition, with a full commentary and critical notes by the late Don Diego Clemencin. As to translations, it is well known that within a few years after the publication of 'Don Quixote,' it was rendered into almost every European language, and that no nation on the Continent has so fully appreciated its standard merits as our own, since we possess no less than eight different English versions, besides several other works more or less relating to it. Thomas Skelton was the first who translated it, London, 2 vols. 4to, 1620. Edmund Gayton next published his 'Pleasant Notes upon Don Quixote,' London, fol., 1654. J. Philips was the next who translated it, London fol., 1687. Motteux (Peter), a Frenchman by birth, published also a version, London, 4 vols. 12mo, 1712. Ozell (John), London, 4 vols. 12mo, 1725. Thomas D'Urfey, London, 2 vols. 8vo, 1729. Jarvis (Charles), London, 2 vols. 4to, 1742. Smollett, London, 2 vols. 4to, 1725. Wilmot, London, 2 vols. 8vo, 1755. By far the best translation, as coming closer to the original than any other, is that of Jarvis, which has often been reprinted.

In the year 1848 Don Adolfo de Castro published at Cadiz a small work of less than fifty pages of large type, professing to be 'El Buscapié,' or 'The Squib,' a dialogue written by Cervantes in defence of 'Don Quixote,' and of which Señor de Castro declared that he had purchased a manuscript copy in the preceding year at the sale of the library of an advocate named Don Pascual de Gándara. A book with the name of Cervantes was sure to attract attention, and the 'Buscapié' was soon translated into French, Italian, Portuguese, German, and English—in our own language twice, once by 'a graduate of Cambridge,' and once by Thomasina Ross. The authenticity of the discovery was however doubted from the first, both in Spain and in other countries, and Mr. Ticknor, in the third volume of his 'History of Spanish Literature,' gives a long list of reasons for drawing it in question, concluding thus—"If Don Adolfo wrote it, he has probably always intended in due time to claim it as his own; if he did not write it, then he has I think been deceived in regard to the character of the manuscript, which he purchased under circumstances which made him believe it to be what it is not." To some of the observations of Mr. Ticknor, Don Adolfo de Castro has published an elaborate reply in the appendix to an illustrated edition of 'Don Quixote,' issued at Madrid in 1850, but he gives no direct reply to the passage we have quoted, and this, with other circumstances, induces us to believe the 'Buscapié' of Cervantes on a par in authenticity with the 'Vortigern' of Shakspeare or the 'More dun' of Walter Scott.

\* SAAVEDRA, ANGEL DE, DUKE DE RIVAS, a Spanish poet, painter, soldier, and statesman, of considerable eminence in all four capacities, was born at Cordova on the 10th of March 1791, the second son of the then Duke de Rivas. He received his early education chiefly from French emigrants, and was in his youth distinguished for his vivacious manners and his passion for drawing. He was afterwards sent to the Royal Seminary for nobles at Madrid, and thence transferred to the military service, having been already entered at the age of seven as a captain of cavalry. He had lost his father in 1802; and in 1806, when he was about to be sent on foreign service under the Marquis de Romana, whose adventures in Denmark form an interesting episode in the early history of the Peninsular war, his mother interposed and procured his exchange into the regiment of body guards of the king, in which his elder brother the then Duke de Rivas was one of the officers. The two brothers were on guard at the Escorial, when after the great outbreak of the 2nd of May 1809 General Frere, who commanded a body of French troops in occupation of the palace, called together the Spanish guards and informed them that Murat desired the assistance of a squadron of their number to march with the French to suppress an insurrection in Segovia. Angel de Saavedra, then a youth of eighteen, burst out with an indignant refusal, which was followed by the other officers; the French proposal was rejected, and shortly after the guards were ordered to march to Madrid. Rumours were rife of their intended massacre; many of them broke up and dispersed, and Saavedra and his brother set out in disguise to make their way to Saragossa and join the army of Palafox. In this they failed after going through many dangers, but they succeeded in joining the Marquis de Palacios, and for the rest of the war were actively employed. Saavedra shared in the battles of Riosoco, Tudela, Ucles, Ciudad Real, and Talavera. At a skirmish at Antigola, on the day before the battle of Ocaña, he was left for dead in the field with eleven wounds, was found at midnight by a soldier in search of spoil, who carried the news to the Duke de Rivas, and on the next day, when the Spaniards lost the battle of Ocaña, Angel de Saavedra amidst the crowds of fugitives was abandoned in a cart by all but two brother officers, who at last brought him to a place of safety, where finally, after receiving extreme unction, he recovered. Later in the war he was taken prisoner by the French under Sebastiani. At its close he retired from the service with the rank of colonel, and took up his residence at Seville.

In the year 1813 he made his first appearance as an author in a volume of 'Ensayos Poéticos' ('Poetical Essays'), which met with sufficient favour to call for a second edition in two volumes in 1820-21. He also in the years 1815 and 1816 produced some tragedies which were acted with moderate applause. The character of all these productions was that of classicism and stiffness, and the author's models

were evidently French. A tragedy entitled 'Lanuza,' on the fate of the Justiza of Aragon, executed by order of Philip II., had more interest than its predecessors from its political tendency. Saavedra joined with enthusiasm in the Spanish constitutional movement of 1820, and 'Lanuza' was acted at Seville with much applause before the suppression of the constitution by the second French invasion of Spain. Its author was chosen deputy to the Cortes for his native city of Cordova. On the downfall of the constitution he took refuge in London, where he commenced an epic poem on the classic model, entitled 'Florinda;' but he soon found that the climate of England was too severe for his health. He removed to Italy, but was refused permission to continue there by the Tuscan and Roman governments, and then withdrew to Malta, where fortunately for him the English flag was flying over a climate like that of Spain. In Malta he remained for about five years, from 1825 to 1830, and while his political principles were confirmed his literary principles underwent a thorough transformation. An intimacy with Mr. Hookham Frere, who, as deeply acquainted with Spanish literature, was glad to converse with a literary Spaniard, led Saavedra to study the English language, to which he had hitherto been a stranger, and he read, under Frere's advice, the best works of English authors, in particular of Shakspeare, Byron, and Walter Scott. The result was an ardent enthusiasm for English literature, and a determination to transplant if possible some of the beauties he admired to the soil of Spain. He commenced the poem of 'El Moro Exposito,' or 'The Moorish Foundling,' the ground-work of which is the old Spanish legend of Mudarra and the Infants of Lara, but the execution of which is intended to emulate some of his English models. This was completed during Saavedra's residence in France, to which country he removed in 1830, and where he earned his support by opening a drawing-school, and by labour as an artist, several portraits from his hand being noticed with approbation by the critics, in the exhibitions of modern artists at the Louvre. The hopes with which he had removed to France were not gratified till January 1834, when he was permitted to return to Spain.

Soon after his restoration to his native country, the death of his elder brother without issue transferred to him the title and estates of the Duke de Rivas. On the establishment of the Athenæum of Madrid, which may be called the university of that capital, he was almost unanimously chosen its president, and he was named by the crown vice-president of the Chamber of Peers. His career as a statesman was as usual in that country stormy and dangerous. As a member of the Isturiz ministry he proposed in 1836 a new plan of public education, and a few months after, on the occurrence of the disgraceful revolution of La Granja, he was obliged to fly for his life, and was concealed in the house of the English ambassador for twenty-two days. He escaped to Lisbon in disguise, and afterwards in an English steamer to Gibraltar, where he found in the governor, General Woodford, one of his old Maltese friends. The storm subsided almost as rapidly as it had risen, and in about a twelvemonth, having given his adhesion to the new constitution of 1837, he was not only permitted to return to Spain and put in possession of his estates, but chosen by various constituencies, and among others by Cadiz, to represent them in the Cortes. His subsequent history has been less marked by vicissitude. He has been a member of several administrations, and was for some years Spanish ambassador to Naples, where he wrote a history of Masaniello's insurrection. The last mention of him that has appeared in the English newspapers was on the occasion of his attending the funeral of Quintana [QUINTANA] in March 1857. He still gives his leisure to poetry and the arts, and some years ago presented four paintings executed by himself to the choir of the cathedral of Seville.

It is agreed on by all the Spanish critics, that the writings of Saavedra have been of much higher value since his literary conversion than they were before. His principal poem is the 'Moorish Foundling,' which was some twenty years ago in the enjoyment of a high reputation, which has now lost some of its lustre. Its merit perhaps consisted more in the novelty of its style and manner to Spanish readers, than in any sterling vigour or spirit of the author's own. His tragedy of 'Don Alvaro,' which was produced shortly after his return from his ten years' exile, is decidedly the most forcible of his dramas, and is like the 'Foundling,' remarkable for its innovations on the established forms. Among his shorter poems, 'El Desterrado' ('The Exile'), which was printed in the 'Ocios,' a Spanish magazine published in London during the author's residence in England, and an address, 'Al Faro de Malta' ('To the Maltese Lighthouse'), are the most successful.

SABATINI, FRANCISCO, a Spanish architect, was born at Palermo in 1722. Having completed his studies in literature and mathematics in his native city, he made choice of architecture as a profession, and visited Rome for the purpose of perfecting himself in it. On leaving Rome for Naples, he was employed as the second overseer of the works at the palace of Caserta, under his father-in-law Luigi Vanvitelli, the architect of that immense edifice. While thus employed, the king bestowed upon him a commission of lieutenant in the artillery, and charged him with the erection of the cavalry barracks near the Ponte della Maddalena, and the arsenal armoury. When, on the death of his brother Ferdinand, the king succeeded to the throne of Spain as Charles III. in 1759, Sabatini settled at Madrid, where, besides being

extensively employed in his profession, he rose to considerable military rank, being made lieutenant-general in 1790, and inspector-general of engineers in 1792, and had various appointments and distinctions conferred upon him. He made some additions and alterations at the royal palace of Madrid, and also at those of Aranjuez and the Pardo. Among his chief works in the capital are the Aduana, or custom-house; the gate of Alcalá (a magnificent façade, with three lofty arches and two other entrances, making in all five openings through both fronts), and that of San Vicente; and the royal porcelain manufactory at Buen Retiro. He also designed the mausoleum of Ferdinand VI. in the church of de las Salesas, the chapel in honour of Palafox in the cathedral of Csmá, the grand altar in that of Segovia, and various other structures, both ecclesiastical and secular, including the arsenal at Caracas, and other works in Spanish America. He died at Madrid on the 19th of December 1798, with the reputation of great skill and judgment in his profession, and of an unusually correct taste.

SABELLIUS, an African bishop or presbyter, from whose teaching originated the heretical Christian sect of the Sabellians. Of Sabellius himself little is known. He appears to have been a Libyan, and Theodoret says he was a native of the Libyan Pentapolis. From the circumstance of Dionysius of Alexandria, the great opponent of Sabellianism, speaking of the heresy as originating in the Pentapolitan Ptolemais, it is supposed that Sabellius resided in that town. He seems to have first put forth his peculiar doctrines about the middle of the 3rd century. The intervention of Dionysius, who had been appealed to both by the Sabellians and their opponents, is placed by Tillemont in 257, but by some other historians a few years later. Whether Sabellius himself was then living is not known: Dionysius does not at any rate appear to have engaged in controversy with him personally, but with the bishops who had adopted his views. The doctrines of Sabellius caused great excitement among the Christians of the Pentapolis, and quickly found numerous adherents. The Sabellians held that there was only one person in the Godhead, namely, the Father; that Christ was a mere man, and that there resided in him a certain energy proceeding from God, or a portion of the divine nature; and they likewise deemed the Holy Spirit merely a divine energy, or an emanation proceeding from God. They illustrated their doctrines by comparing God to the sun, the Word to its illuminating power, and the Holy Ghost to its warming energy. They were successfully opposed by Dionysius of Alexandria, but continued for a long time to be an important sect. (Lardner, *Credibility and History of Heretics*; Tillemont, *Mémoires*; Neander, *Kirchengeschichte*; Mosheim, *Ecclesiastical History*, and the ancient authorities there cited.)

SABINIANUS of Volterra was elected Bishop of Rome after the death of Gregory I., or the Great, A.D. 604. He had been employed on a mission to the court of Phocas, the usurper of the Eastern empire. He is said to have shown himself avaricious and fond of hoarding, and to have thereby incurred the popular hatred. If such was the case, he was very different from his predecessor, who was very generous towards the poor. Sabinianus died in about eighteen months after his election, in 605; and was succeeded, after a vacancy of nearly one year, by Boniface III., the first bishop of Rome who was acknowledged by the imperial court of Constantinople as primate of the whole Church.

SABINUS, AULUS, a Roman poet, was a contemporary and friend of Ovid, whom he followed and imitated in that species of poetry of which Ovid has left specimens in his 'Heroides.' All we know of him is that he died at an early age, and that he wrote a series of 'Epistles' (Heroides), supposed to be addressed by heroes to heroines, and to be the answers to those epistles which Ovid has addressed to the heroines in the name of the heroines. The Heroides of Sabinus, according to Ovid ('Amor,' ii, 18, 27, &c.), were—Ulysses to Penelope, Hippolytus to Phædra, Æneas to Elissa, Demophoon to Phyllis, Jason to Hypsipyle, and Phaon to Sappho. (Comp. Ovid, 'Ex Pont,' iv, 16, 18.)

There are extant only three Heroides, Ulysses to Penelope, Demophoon to Phyllis, and Paris to Oenone, which are generally ascribed to Sabinus. It has been doubted, by G. Vossius and others, whether these poems really belong to Sabinus; but J. Ch. Jahn ('De Publ. Ovid. Nason. et A. Sabini Epistolæ Dissert.,' pars. i, Lips., 1826), and nearly all modern editors of Ovid, have maintained that they belong to Sabinus; Gläser however ('Der Dichter Sabinus' in the 'Rheinisches Museum' for 1842) is of opinion that they belong to a much later writer. They are in every respect inferior to the poems of Ovid; the style is deficient in animation, and the poet's imagination seems to have been very limited.

The poems attributed to Sabinus are generally printed at the end of the works of Ovid, and also in the separate editions of the Heroides of Ovid. (See Ovidii et Auli Sabini Epistolæ, cum annotat., &c., by Vitus Loers, 8vo, Colonia, 1829-30.) This edition is preceded by a valuable introduction on the poems of Ovid and Sabinus.

SABINUS, CÆLIUS, M., a Roman jurist, and the successor of Cassius Longinus. He was made Consul Designatus by Otho (Tacit., 'Hist.,' i, 77); and his consulship belongs to the year A.D. 69, in which Otho died and Vitellius became emperor. He belongs chiefly to the time of Vespasian. He wrote a work, 'Ad Edictum Edilium Curulium,' which is cited by other jurists (Gaius, 'Dig.' 20, tit. 1, s. 20); but there is no excerpt from Cælius Sabinus in the 'Digest.' He also wrote on

other subjects ('Dig.' 35, tit. 1, s. 72, § 7). The extract in Gellius (vii, 4, 'Pileatos servos,' &c.) is probably from the treatise 'Ad Edictum;' for Gellius in another passage (iv, 2) speaks of Sabinus as the author of such a treatise, though he calls him in this passage, according to some manuscripts, Cælius. He is often cited in the 'Digest' simply by the name of Sabinus or Cælius ('Dig.' 20, tit. 1, s. 14, 17, 65). Cælius Sabinus is cited by Gaius in his 'Institutiones' (iii, 70, 141).

SABINUS, MASSURIUS, a Roman jurist, a pupil of Aelius Capito, and the contemporary of Cocceius Nerva. He lived under Tiberius; but he did not die in that reign, as is generally asserted, if the passage of Gaius (ii, 218) refers to Massurius Sabinus, of which indeed there can be no doubt. Massurius Sabinus gave the name of Sabiniani to the school which was opposed to that of the Proculiani. He was near fifty years of age when he was raised to the equestrian rank, and was in such poor circumstances that he was mainly supported by the fees of his pupils. (Pompon., 'Dig.' i, tit. 2, s. 2, § 47.) It is said of him by Pomponius 'publicè primus respondit' ("he was the first who gave opinions publicly"). Though the word is 'respondit' in the common editions of the 'Digest,' the passage is quoted thus by Zimmern, 'publicè primus script.' It follows however from what Pomponius says, that with Massurius began the practice of giving written opinions, which were sealed with the seal of the jurist ('responsa signata').

The reputation of Sabinus is shown by the publicity of his name, which was equivalent to the title of a great lawyer (Persius, 'Sat.,' v, 90; Arrian, 'Epictetus,' iv, 3); and by giving his name to the school, of which his master Capito was considered to be the real founder. This is evidence of the greater originality and more enlarged views of Sabinus. His great work was 'Libri III. Juris Civilis,' from which there is no direct excerpt in the 'Digest,' though there are various fragments in Gellius (iv, 1; v, 13, &c.). The system followed in this work had a great influence on subsequent writers. Pomponius wrote at least 36 Libri ad Sabinum, Paulus 47, and Ulpian 51. The arrangement of the matter of the work of Sabinus is made out conjecturally by J. Gothofredus from the labours of his three commentators. (Zimmern, p. 313, n. 7.)

The other works of Sabinus were—'Commentarii de Indigenis,' 'Libri Memorialium,' 'Fasti,' books of 'Responsa,' a commentary 'Ad Edictum,' and 'Libri ad Vitellium.'

(Zimmern, *Geschichte des Röm. Privatrechts*; Index to A. Gellius, ed. Gronov., 1706; Grotius, *Vite Jurisconsultorum*.)

SACCHETTI, FRANCO. This eminent contemporary of Boccaccio, who was distinguished, like him, though in less degree, as an Italian novelist, was one of the earliest cultivators of a prose style in the language. The precise date of his birth is not known, but Bottari has fixed it about 1335, for which he alleges various proofs derived both from Franco's own writings and other circumstances. His father was Benci di Ugucione, of the Sacchetti family, one of the most considerable in Florence. He appears to have received an education of a superior kind, and to have been well versed not only in polite literature, but in severer studies; and that he was above the prejudices of his age is proved by one or two of his tales, wherein he derides the pretended science of astrology, and inveighs against that false and mistaken devotion which substitutes superstitious observances for genuine piety. Literary studies however were to him rather relaxations from more serious duties than his chief occupation; for he was actively engaged in public life, and at various times filled many important offices, which were conferred on him by his fellow-citizens. From what he says in one of his canzoni, it appears that in the earlier part of his life he visited Selavonia, for he describes the rude unpolished habits and manners of the people, and his eagerness to see Florence again. It is probable therefore that he was engaged there in commercial affairs, it being then the custom for Florentine and other Italian merchants to establish themselves in foreign countries. In 1383 he filled the office of one of the magistrates Degli Otto, or Council of Eight, at Florence; and two years afterwards was chosen, much against his inclination, as ambassador from the republic to Genoa; but he escaped that honour by happening at the same time to be elected podestà, or chief magistrate, of Bibbiena. He afterwards held the same office, first at San Miniato, and in 1396 at Faenza, which latter he accepted merely because its emoluments were of consequence to him in his then straitened circumstances.

The time of his death is as much matter of uncertainty as that of his birth. Crescimbeni makes him live till after 1410, while Bottari conjectures that he must have died shortly after the beginning of the century. He was thrice married: first in 1354 to Felicità, daughter of Niccolò Strozzi, to whom he was greatly attached, and by whom he had several children; secondly, in 1387; and lastly in 1396, when, supposing him to have been born in 1335, he was in his sixty-first year, which is one of the reasons brought forward by his biographer for assuming that he could not have been born much earlier than the date he assigns; yet in itself it is a most inconclusive circumstance. By his first wife he had several children, of whom only Filippo and Niccolò survived him. The latter, who was gonfaloniere at Florence in 1419, had a son named Franco, a person of some literary distinction among his contemporaries, which circumstance has led several writers to confound the grandfather and grandson, or rather to attribute the

works of both to the same individual, whom they describe as an eminent poet and historian, and writer of tales.

Although his sonnets, canzoni, capitoli, and other metrical compositions obtained for him great repute as a poet among his contemporaries and his countrymen, it is chiefly by his 'Novelle' that the elder Franco is now known as a writer. It is singular however that although the 'Novelle' had previously been quoted as authorities for the language in the dictionary 'Della Crusca,' and spoken of by critics as next, both in style and merit, to those of Boccaccio, they existed only in manuscript copies until 1724, when they first issued from the press, edited by Bottari. The collection originally consisted of three hundred tales, but of that number only two hundred and fifty-five now remain. They do not show much invention, nor indeed do they correspond to their title, being for the most part not narratives, but merely short anecdotes, whose matter is frequently very trivial, owing to which their interest now consists almost entirely in their relating to historical personages, and in their throwing light upon many customs and other obscure matters. Some of them have been appropriated and adapted by modern writers; Bürger, for instance, has taken Sacchetti's fourth novella, and transformed it into his popular comic ballad entitled the 'Emperor and Abbot,' without mentioning the source of it.

Bottari mentions a comic poem entitled 'La Battaglia delle Vecchie colle Fanciulle,' existing in manuscript in the Gaddi Library, as attributed to Sacchetti, merely observing that he had never been able to procure a sight of it. This production, which is in two cantos, and consists altogether of only one hundred and thirty stanzas in rima ottava, was printed for the first time at Bologna in 1819, and dedicated to Lord Byron; and was reprinted in the 'Scelta di Poemi Giocosi,' published by Bettoni at Milan, 1833. Amati, the first editor, supposes it to have been written about 1354, and it may be allowed to entitle Sacchetti to the honour of being considered the father of Italian heroic-comic poetry.

SACCHETTI, GIAMBATTISTA, was born at Turin, where he studied architecture under Juvara, who, in his last illness, recommended him as his successor for carrying into execution the designs for the new palace at Madrid. He was accordingly summoned to that capital by Philip V. in 1736. The original design by Juvara was upon a most extraordinary scale, the plan forming altogether a square of 1700 feet to the side; but as the king insisted upon the new edifice being erected on the precise site of the former one (destroyed by fire in 1734), notwithstanding all remonstrances and advice to the contrary, both on the part of the architect and of many other individuals, Juvara's design was laid aside altogether, and his successor had to prepare an entirely new one, in which the plan was greatly curtailed, being reduced to a square of 470 feet. Even thus abridged, the present edifice (begun in April, 1737) is a vast pile, and one of unusual loftiness; for, owing to the great declivity of the ground, the height in some parts is about 150 feet, and, including those in the substructure and basement, there are no fewer than nine different floors. But so many different ranges of windows do not contribute to grandeur; on the contrary, they occasion a certain character of littleness, and give the whole the appearance of being too much cut up and crowded. This important work occupied Sacchetti so much as to leave him little leisure for anything else of importance, except completing the façade of the palace of St. Ildefonso as designed by Juvara. He was also director of the public school of architecture at Madrid; and on the Academy of St. Ferdinand being established, 1752, he was complimented with the honorary title of director in it, being excused, on account of his other avocations, from attending to its duties. Ill health at length compelled him to resign his professional engagements altogether in 1760, some time previously to his death, which did not happen till December 3, 1764.

SACCHI, ANDREA, one of the greatest masters of the Roman school of painting, was the natural son of Benedetto Sacchi, an obscure painter, and was born in the vicinity of Rome, about 1599. He acquired the rudiments of his art from his father, who, perceiving the ability of his son, placed him at an early age in the studio of Albano, with whom he remained several years. He soon distinguished himself as the most promising of all Albano's scholars, and in a short time surpassed his master also, whom while still his pupil, he excelled in every respect.

Sacchi enjoyed a local reputation while very young, and upon the accession of Urban VIII. in 1623, through his interest with the Barberini family, he was appointed to execute one of the great altarpieces of St. Peter's; and he painted a large picture for the altar of Gregory the Great, representing the performance of a miracle by that saint. This piece, which in 1771 was copied in mosaic by Alexander Cocchi, is equally conspicuous for correctness of design and simplicity and harmony of colouring, and it established Sacchi's fame. A great allegorical composition, representing the Divine Wisdom, which he executed in fresco in the Barberini Palace for Cardinal Antonio Barberini, the nephew of Urban VIII., gained for Sacchi the reputation of being the greatest painter in Rome. He painted many other works for the same cardinal, who granted him a pension for life.

His next great work was St. Romualdo relating his vision to five monks of his order, which is considered Sacchi's masterpiece, and not-

withstanding its remarkable simplicity, both of composition and colour, has been generally pronounced to be one of the finest works in Rome. The scene is in the valley of Camaldoli in the Apennines, and the saint is represented seated at the foot of a great tree; the monks are standing in simple and attentive attitudes around him; all the figures are similarly attired in white, but the shadow of the tree is so admirably arranged as to give the whole a pleasing and grand effect. This picture was carried away by the French, but it is now in the museum of the Vatican; it has been excellently engraved by Frey. Sacchi also executed the following great works: the Death of St. Ann (also engraved by Frey); the miracle of St. Antony; St. Joseph; St. Andrew; and eight pictures from the life of John the Baptist, for the church of San Giovanni in Laterano; and others of less importance.

Considering the great powers of Sacchi and the age to which he lived, he produced remarkably few pictures. It was a maxim with him that the merit of a painter consisted not in executing much of moderate merit, but little and excellent; he was however a man of decidedly dilatory habits. He spent much of his time in contemplating the great works of his favourite masters, and of all the pictures in Rome those which he most admired were the 'Transfiguration' by Raffaele, the 'Communion of St. Jerome' by Domenichino, and 'St. Peter healing the Cripple' by Cigoli (since destroyed). When reproached for his inactivity, he used to reply that Raffaele and Annibal Caraoci had disheartened him and filled him with despair. His admiration of Raffaele amounted to absolute veneration; his contemporary Passeri relates that occasionally when some one of his scholars had shown him a study from that great painter, he has been led away from the consideration of the design before him into the contemplation of the great powers of the designer, and has passionately exclaimed, "What! they would make me believe that Raffaele was a man; no, he was an angel." And when he made a tour through the north of Italy, subsequently to his painting the St. Romualdo, for the purpose of examining the works of the Lombard and the Venetian masters, being much struck with the delicacy and richness of effect of Correggio and Titian, he expected to feel a deficiency in the works of Raffaele upon his return to Rome; but immediately he saw the 'Mass of Bolsena' in the Vatican he exclaimed, "here I find not only Titian and Correggio, but Raffaele also."

Sacchi's manner of execution was very broad, and his colouring subdued and perfectly harmonious; he is considered one of the best colourists of the Roman school. His design was pure and elevated; and his composition natural and simple: repose and dignity of character prevail throughout all his works. His forms are classical, though natural; he was thoroughly acquainted with the great works of antiquity. Sacchi died in 1661. He had many imitators, and notwithstanding the rivalry of Pietro da Cortona and the opposition of Bernini, he formed a numerous and celebrated school. Nicolas Poussin attended his academy, but his greatest scholar was Carlo Maratta, who, after the death of Sacchi, became the leader of the faction which was opposed to the imitators of Cortona.

SACCHINI, ANTONIO GASPARO, a composer, whose strains once resounded in every lyric theatre in Europe, but of whom little more than the name remains, was born at Naples, in 1735, and there educated, at the 'Conservatorio di Santa Maria,' under the once famous Durante, who himself is now nearly forgotten. So successful were Sacchini's studies, that the moment they were completed he was engaged to compose an opera for Milan, whither he proceeded for the purpose; but there the prima donna made so sudden and so deep an impression on a mind always too susceptible, that to her he devoted the time that ought to have been bestowed on his work, which at length he was compelled to begin and finish, we are told, in four days. This was 'L'Isola d'Amore,' an opera that pleased not only the public, but the critics. Sacchini then went to Venice, next to Stuttgart, afterwards to London, and finally to Paris, in which cities his numerous operas were performed, but with most success in the last, where he set his music to French words for the Académie Royale. The Parisians, Dr. Burney tells us, almost adored Sacchini, and when he died—overwhelmed with debt and exhausted with gout—in 1786, he was honoured with a splendid public funeral, at which Piccini, once his rival, now his panegyrist, spoke his éloges.

SACHEVERELL, HENRY, D.D., was descended from a family which, according to Boyer ('Reign of Queen Anne,' p. 406), had in one of its branches made a considerable figure in Derbyshire. His grandfather, John Sacheverell, who had been educated for the Church, joined the Puritans in the reign of Charles I., and, after the overthrow of episcopacy, officiated as Presbyterian minister at Wincanton in Somersetshire; but, refusing to conform, was of course silenced at the Restoration, and, being afterwards apprehended at a conventicle, endured an imprisonment of three years, which is said to have occasioned his death. Joshua, his son by a first marriage, however grew up a zealous churchman, and died minister of St. Peter's church, Marlborough, leaving a widow, with a numerous family, in very poor circumstances. Henry, one of the sons, the subject of the present notice, who appears to have been born about 1672, was adopted by one Edward Hearst, an apothecary of the place, who was his godfather; and by Hearst's widow he was, after having attended the grammar-school of Marlborough, sent to Magdalen College, Oxford.

At college Sacheverell was chamber-fellow with Addison, and they remained intimate friends till politics separated them thirty years after. To Sacheverell Addison inscribed in a very affectionate dedication his 'Farewell to the Muses,' written in 1694, when he intended to enter into holy orders. Sacheverell himself also cultivated both English and Latin poetry; several of his pieces in Latin verse (some ascribed to his pupils, but others with his own name affixed to them) are contained in the 'Musæ Anglicanæ' and he is the author of a translation into rhyme of part of Virgil's 'First Georgie,' dedicated to Dryden, which is printed in the third volume of Nichols's 'Collection of Poems.'

Sacheverell became a Fellow of his college, and appears to have been rather celebrated and successful as a college tutor. The Whig accounts of him indeed are full of stories to his disadvantage in this as in every other part of his career, but they have all the air of the inventions or exaggerations of party malice. Among other things it is asserted that he was refused ordination by Dr. Lloyd, bishop of Lichfield and Coventry (afterwards of Worcester), on the ground of his deficiency both in divinity and classical knowledge; but afterwards, it is added, he was, on the recommendation of the bishop of Oxford, admitted into holy orders by this same Lloyd, "with particular marks of favour." He took his degree of M.A. in 1696, of B.D. in 1707, and of D.D. in 1708. The first living he held was Cannock in Staffordshire, but in 1705 he was appointed preacher of St. Saviour's, Southwark; and it was while in this situation that he delivered his two famous sermons, the first at the assizes at Derby, on the 15th of August, 1709, the second before the lord-mayor at St. Paul's, on the 5th of November in the same year. These discourses, having been printed, were both in December following brought under the notice of the House of Commons, which passed a resolution denouncing them as "malicious, scandalous, and seditious libels, highly reflecting upon her majesty and government, the late happy revolution and the Protestant succession as by law established, and both houses of parliament, tending to alienate the affections of her majesty's good subjects, and to create jealousies and divisions among them." The author and printer were at the same time ordered to attend at the bar of the House, which they did accordingly on the next day (14th December); and then, after he had admitted the authorship of the sermons, it was moved and carried that Sacheverell should be impeached of high crimes and misdemeanours. It is asserted by Swift and other authorities that Sacheverell's real offence, in the eye of the Whig ministry of the day, was his having in one of his two discourses pointed, as was conceived, at the lord-treasurer Godolphin, in a passage about "the crafty insidiousness of such wiley Volpones." Volpone seems to have been before this a popular nickname of Godolphin.

After various preliminary proceedings, the trial commenced before the House of Lords in Westminster Hall on the 27th of February 1710, and lasted till the 20th of March, on which day a majority of their lordships (69 to 52) pronounced Sacheverell guilty; and three days after, sentence was passed, adjudging him not to preach for three years ensuing, and ordering his two sermons to be burnt by the common hangman. The populace, who had espoused the cause of the accused, considering him, with the great majority of the clergy, as the champion of the Church, celebrated this impotent conclusion of the affair with bonfires and other rejoicings both in London and all over the kingdom; and when, in May following, he set out to take possession of the living of Salatin in Shropshire, to which he had been presented, his journey to Oxford, and thence by Banbury, Warwick, and Wrexham to his preferment, was a continued triumph; which was prolonged as he returned to London through Shrewsbury, Bridgenorth, Ludlow, Worcester, and other towns. It is admitted on all hands that nothing had so much effect as this affair of Sacheverell's in influencing the general election which took place this same autumn, and the immediate consequence of which was the overthrow of Godolphin and his colleagues.

On the expiration of his sentence in March 1713, Sacheverell preached at St. Saviour's church, on the Christian triumph, or the duty of praying for our enemies, and again published his discourse. "I have been reading Sacheverell's long dull sermon, which he sent me," says his friend Swift, in his Journal to Stella, under date of April 4th; "it is the first sermon since his suspension has expired, but not a word in it upon the occasion, except two or three remote hints." In a preceding entry he mentions that Sacheverell himself had told him the bookseller had given him 100*l.* for the sermon, and intended to print 30,000. "I believe," adds Swift, "he will be confoundedly bit, and will hardly sell one-half." Of his St. Paul's sermon, Burnet states that about 40,000 copies were supposed to have been printed and dispersed over the nation. The new House of Commons, by way of marking their disapprobation of the former proceedings against him, appointed him to preach the sermon before them on the anniversary of the Restoration; and the court followed in the same course. Within a month after the removal of his suspension the queen presented him to the valuable rectory of St. Andrew, Holborn; and it appears that he had interest enough with the new ministers to procure also a handsome provision for one of his brothers. He had besides the good fortune to have a considerable estate at Callow in Derbyshire left to him by his kinsman, George Sacheverell, Esq. He never appeared again as an author, except in a dedication prefixed to a volume of posthumous ser-

mons by the Rev. W. Adams, published in 1716; but he is stated to have made some noise in the world by his quarrels and law-suits with his parishioners—a sort of stimulus which his system possibly required after his having played so remarkably a part in the greater field of national affairs; but he was evidently a weak and excessively vain and selfish man. He was also suspected of being concerned in the alleged plot of his friend Atterbury, who is believed to have written the defence which he delivered on his impeachment, and to whom, then in exile, he left a legacy of 500*l.* at his death, which took place on the 5th of June, 1724. From the Stuart papers it would seem that he was certainly concerned in the plot for restoring the Stuarts, as in the 'Minute of what was resolved on by his Majesty (the Pretender) and Earl Bolingbroke, October 14, 1715,' quoted by Lord Mahon, 'Hist. of Eng.,' i., chap. 2, is this entry:—"Sacheverell to make his way to the king (on his landing), unless he can be more useful in London."

(*State Trials*, vol. xv., pp. 1-522; *Parliamentary History*, vol. vi., pp. 805-887; Burnet, *History of his Own Time*, ii., 537, &c.; Boyer, *History of the Reign of Queen Anne*, pp. 406, &c.; Tindal, *Continuation of Rapin*, vol. iv., pp. 149, &c.; Swift, *Journal: Four Last Years of the Queen*, and other works; Duchess of Marlborough, *Account of her Conduct*. A note in Howell's 'State Trials,' vol. xv., p. 14, informs us that "there is a curious passage about Sacheverell in Harris's 'James II.,' p. 184;" but Harris wrote no life of James II., nor can we find Sacheverell mentioned in any of his other lives.)

SACHS, HANS, whose real name is said to have been LOUTZDORFFER, was the most eminent poetical genius that Germany produced at the period of the Reformation, to the doctrines of which he became a convert, and assisted the cause of Protestantism by his pen. This most prolific as well as original and highly-gifted writer, was born on the 5th of November 1494 at Nürnberg, where his father was a tailor; and after studying at the Latin schools, he was put to be instructed in the business of a shoemaker.

About two years after he entered his apprenticeship, that is, about the age of seventeen, Hans became the disciple of Leonard Nunnenbeck, a weaver by trade, but also a meistersinger, who initiated him into the mystery of weaving verses. As soon as his apprenticeship expired he set forth on his wanderings through Germany in his double capacity, making it a point to visit those cities which were most renowned for their poetical societies and corporations of singers. Having finished his pilgrimage, he returned and settled at Nürnberg, where in 1519 he married Kunegunda Kreutzer, who proved an excellent wife, and bore him five sons and two daughters. She died in 1560 (after surviving all her sons); and in the following year, when he was sixty-six, Sachs married Barbara Harscher, which union proved no less happy than the former one. His eyesight becoming impaired, and his hearing still more so, he withdrew from society, and shut himself up with his books; his natural serenity and cheerfulness of temper however were not disturbed by these misfortunes. Thus tranquilly he reached his eighty-seventh year, dying January 25, 1578.

If his literary character be estimated by the number of his productions, Hans Sachs was literally one of the greatest writers Germany has ever produced, for they amounted altogether to upwards of six thousand different compositions, of which only a portion are contained in the five folio volumes of his pieces printed at Nürnberg, 1576-79. He may therefore very well be paralleled to Lope de Vega; and considering that he had another business, the fertility of his pen is even more surprising than that of the Spaniard's. Such extraordinary writers however pay a double penalty: their productions are of necessity only extemporaneous effusions upon paper, and by far the greater bulk of them must be consigned to oblivion. By posterity they are known only as recorded literary phenomena: they preserve a name in the annals of poetry, and as much as that has been accomplished by a single composition, such as the 'Elegy in a Country Churchyard,' and 'Julius von Tarent'—productions that immortalise the names of a Gray and a Leisewitz. For the student who is desirous of tracing the formation of the language and literature of Germany, the works of Sachs possess considerable interest independent of their intrinsic merits, which however, to be fairly appreciated, must be considered with reference to his own times and country. They display great shrewdness, liveliness, and keenness of satire, together with a steady manliness of tone. But they also frequently offend both modern taste and modern ideas of decorum. Their failing in that respect is the very reverse of refined immorality. Nor is that by any means their sole defect; for, as might indeed be expected, they are overlaid with a great deal of mere garrulous prosing, unrelieved by any charm of versification. Another great fault is, that all the subjects are too much in the same strain, stamped by the same manner; wherefore it has been remarked, that two or three of his pieces serve to render us acquainted with the whole. Yet it is easier to point out faults and imperfections of the kind above mentioned, than to estimate such a writer critically. Göthe to a certain extent imitated Hans Sachs in his 'Faust.' Sachs has been eulogised for "the fidelity of colouring with which he exhibits the characters and times which he paints." But this remark must be taken with great limitation, and with reference only to the manners of his own age, for his anachronisms against history, costume, and probability are frequently quite startling—Semiramis and Cleopatra, Agrippina and Clytemnestra, appear together in the same piece. In fact, according to his own confession, he was acquainted

with neither Greek nor Latin, and knew the works of the ancients only through such translations as were then to be procured. Yet, though excluded from the learned languages, his reading was remarkably extensive. After all, whatever imperfections criticism may allege against the writer, biography has none to record against the man, save those which are common to human nature. He uniformly employed his pen with the best of motives—to reform and instruct; and not only was his personal character irreproachable, but the amiable ‘bon-homme’ of his disposition such as to obtain for him the appellation of ‘Honest Hans Sachs.’

SACHTLEVEN (or ZACHTLEVEN), CORNELIUS, was born at Rotterdam in 1606. It is not known under what master he studied, but it is apparent that he was a careful observer of nature. He settled at Antwerp, and gained great reputation by painting subjects from low life in imitation of Brauer. His corps-de-garde are much praised for their judicious grouping and truth to nature. He painted also the interiors of farmhouses, and the sports and recreations of the villagers, in the style and manner of D. Teniers. Though much inferior to the two great artists whom he chose for his models, his works have considerable merit, and are found in the best collections. He died in 1685.

SACHTLEVEN, HERMAN, was born at Rotterdam in 1609, and studied under John van Goyen. He did not however confine himself to the style of his master, but applied with the greatest diligence to the study of nature, making numerous sketches and designs, which are highly esteemed by the curious. The scenery of the Netherlands not being suitable to his taste, he visited the countries on the banks of the Rhine and the Meuse, which afforded him more picturesque subjects. Some writers have affirmed that he visited Italy, but the Dutch biographers appear to have proved that he never travelled farther from home than to the countries above mentioned. His pictures are highly finished, with a light free touch, and a skilful management of the aerial perspective. He generally introduces into his landscapes a great number of figures and boats, which are drawn with great correctness and spirit. His skies and distances are in general clear, and he often endeavours to express the effects of the vapour between the eye and remote objects, like Berghem and Wouvermans. His merit was appreciated by his contemporaries, and his best pictures, which are not common, are still highly esteemed. He died in 1685, at the age of seventy-six.

SACKVILLE, THOMAS, EARL OF DORSET, was born in 1536, at Buckhurst in Sussex. He was the only son of Sir Richard Sackville, the representative of a very ancient family, who had been high in office under Edward VI., Mary, and Elizabeth. After studying some time both at Oxford and Cambridge, and taking the degree of M.A. in the latter university, he removed to the Inner Temple, and was called to the bar. Shortly afterwards he was elected a member of the House of Commons. His youth, though passed in dissipation and extravagance, was not wholly mispent, as is shown by his poems, which were written at an early period of life, and were the first-fruits of his vigorous and fertile mind. At the time of his father's death, in 1566, he returned from the Continent, which he had visited after his marriage. In the same year he was created Lord Buckhurst by Elizabeth, and having on a sudden reformed his habits of profuseness, received from that time various marks of royal favour. In 1570 he was sent on an embassy to France, to treat of the marriage then proposed between the queen and the Duke of Anjou; and in 1587 was employed as ambassador extraordinary to the United States of the Netherlands, to adjust the differences between them and the Earl of Leicester, whose anger he drew upon himself in the discharge of this duty. He was in consequence imprisoned till the death of his formidable enemy in 1588, after which event he was at once restored to Elizabeth's confidence, and filled a variety of state offices. In 1598, on the death of Burghley, he was made lord-treasurer, which situation he held during the next reign till his death, April 19, 1608, having, with rare good fortune, had his great services fully appreciated by two royal personages of very different character. His letters, many of which are preserved in the Cotton Collection in the British Museum, show that he was distinguished by the qualities which befit a statesman, and they confirm the judgment of his contemporaries.

His poems are—the tragedy of ‘*Ferrex and Porrex*’ (called in a later edition ‘*Gorboduc*’); ‘*The Induction*,’ or poetical preface to ‘*The Mirror for Magistrates*’; together with ‘*The Complaint of the Duke of Buckingham*,’ in the same collection. Of these ‘*The Induction*’ possesses great merit, and reminds us of the poems of Spenser, to which, though inferior in richness of imagery, it bears great resemblance not only in the curious exactness with which the lively portraiture of allegorical personages is made out, but in the language and metre. The earnestness and quaintness of antiquated forms of speech, and the stately structure of the verse, contribute much in the compositions of both poets to the solemn effect of the pictures which are presented in succession to the reader. Warton, in his ‘*History of English Poetry*,’ considers Dorset to have furnished the model upon which Spenser formed his style. For some further information see Wood's ‘*Athenæ Oxonienses*’ (Bliss).

SACKVILLE, CHARLES, EARL OF DORSET, was born January 24, 1637. In his youth he travelled into Italy, and returned a little before the Restoration; he afterwards sat in parliament for the borough of East Grinstead in Sussex. Being, like most young noblemen

of his day, of a dissolute turn, he engaged in no public employment, and he became a great favourite with Charles II. In 1665, being then Lord Buckhurst, he attended the Duke of York as a volunteer in the Dutch war; and on the eve of the battle in which the enemy were defeated, and Opdam, their admiral, killed, he is said to have composed the celebrated song beginning ‘*To all ye ladies now on land*.’ He was employed after this in short embassies to France. Having become Earl of Dorset by the death of his father, 1677, he soon after chose for his second wife a daughter of the Earl of Northampton.

Dorset was favourably noticed by James II., but ceased to be one of his adherents as he grew more violent in his measures. After the king's departure, he sat with other peers in council to preserve the public peace. At the accession of William III. he was appointed lord-chamberlain of the household, and received other marks of royal favour. His health after this declined, and he died at Bath, January 19, 1705-6. A rare felicity, both in speech and action, seems to have distinguished Dorset above all his contemporaries. This is admitted by those of his brother courtiers who were themselves most remarkable for wit and address. Something of the ease and sprightliness of his conversation has been transmitted to us through his poems, though there is little to justify the extravagant praises of Dryden and others, these compositions being few in number and on trifling subjects. They are printed among the minor poets. An elaborate panegyric by Prior, and a biography by Johnson, abridged from a longer one by Cibber, may be consulted for his life. See also Walpole's ‘*Royal and Noble Authors*’ (Park).

SACKVILLE, LORD GEORGE, a younger son of the ducal house of Dorset, was born January 26, 1716. During the reign of George II. he was actively engaged both as a statesman and a politician; he served at Dettingen and Fontenoy, and at the battle of Minden, fought in 1759, he commanded the British forces under Prince Ferdinand of Brunswick. To this he owes the greater part of his notoriety: having failed to execute the prince's orders to charge, by which default the victory was rendered less decisive than it might have been, he was insulted by his commander, and, at his own request, recalled to England, where he demanded, and with some difficulty obtained, a court-martial, by which, April 3, 1760, he was adjudged incapable of serving thereafter in any military capacity. George II., who was highly incensed at Sackville's conduct, took every means of rendering his punishment most galling; and among other things, erased with his own hand, in council, Lord George Sackville's name from the list of privy-councillors. In the reign of George III., to whom he was personally acceptable, he returned to public life; and having attached himself to Lord North, was made secretary of state for the colonies in 1775, and had the direction of the American war: with what success need not be here said. In 1782, he, with his leader, retired from office, having just before been raised to the peerage by the titles of Viscount Sackville and Baron of Eblebrook, titles united to the dukedom of Dorset by the accession of Lord George's eldest son to that superior dignity. In 1770 Lord George Sackville took the name of Germain, for an inheritance, under which name he is equally well known. He died August 26, 1785.

Two explanations may be found of his misconduct at Minden: one, lack of personal courage, of which he had before been suspected; the other, personal pique against Prince Ferdinand, indisposing him to act with vigour. The latter is perhaps less creditable than the former. It is to be added however that some inconsistency seems to have existed in the orders delivered to him, which may have given rise to hesitation in a man unequal to the emergency, without gross cowardice or wilful and predetermined betrayal of trust. Of his political career nothing need be said.

SACRO-BOSCO, JOHANNES DE, an eminent English mathematician of the 13th century, contemporary with Roger Bacon. The place of his birth is generally supposed to have been Holywood, but is not positively known, there having been at that period at least two towns in England of that name. According to Mackenzie, who has claimed him for a native of Scotland without any satisfactory evidence, he was admitted a member of the University of Paris in the year 1221, where he afterwards greatly distinguished himself as professor of mathematics. All the biographers agree in asserting that he spent the greater part of his life in Paris, and it is equally certain that he was some few years at Oxford, where he is said by Whethamstede to have lectured before large audiences with great applause. He died at Paris in the year 1256, as appears from the inscription on his monument in the cloisters of the Mathurine convent at that place. As an author, he is more distinguished by a few elementary works which he left behind him, and which obtained a most extended popularity, than for much originality of talent. His treatise ‘*De Sphæra Mundi*,’ which is merely a paraphrased translation of a portion of Ptolemaeus's ‘*Almagest*,’ continued to be used in the schools for nearly four centuries; it was printed for the first time in the year 1472, passed through more than twenty editions, and was commented on by several first-rate astronomers. In 1244 he composed a tract, ‘*De Computo Ecclesiastico*,’ which contains the common rules of that science; a curious colophon, which Wallis and Vossius give from old manuscript copies, is our authority for the date of its composition. Perhaps however his most popular work is a tract ‘*De Algorismo*,’ one of the earliest known works on arithmetic in which the Arabic numerical notation is em-

played. This latter work, which is very common in manuscript, is printed in Halliwell's 'Rara Mathematica,' pp. 1-26, and a nearly contemporary English translation of it is preserved in manuscript in the Ashmolean library at Oxford.

SACY, ANTOINE ISAAC SILVESTRE DE, was born at Paris, on the 21st of September 1758. His father, Jacques Abraham Silvestre, practised as a notary in that capital. At the early age of seven De Sacy lost his father, but his mother took great care of his education, which, owing to the delicate state of his health, was directed by a tutor under his maternal roof. His progress in classical studies was very rapid, as appears from his intimate acquaintance both with Latin and Greek literature. At the age of twelve he became acquainted with Dom Berthureau, a Benedictine of St. Germain-des-Prés, who was then engaged in preparing a collection of such Arabian historians as have written on the Crusades, and who inspired him with a taste for Oriental languages. Having finished his classical studies, De Sacy began the study of Hebrew. From Hebrew he proceeded to the Syriac, Chaldee, and Samaritan, and thence to Arabic and Ethiopic. With these laborious pursuits De Sacy combined the study of the Italian, Spanish, English, and German languages, with all which he made himself well acquainted. He soon added to his knowledge of Arabic that of Persian and Turkish, two languages which, being then very little known in Europe, required new investigations on his part.

De Sacy's first literary labours were directed towards Biblical researches. In 1780 at the age of twenty-three, he undertook the examination of a Syriac manuscript in the Bibliothèque Royale, which contained a translation of the Fourth Book of Kings, and he made some notes on the subject which appeared in Eichhorn's 'Biblical and Oriental Repertory' (Leyden, vol. vii., p. 227, et seq.). In 1785 he was elected a titular member of the Academy of Inscriptions and Belles-Lettres. Immediately upon his appointment he wrote two memoirs, one upon the breaking of the dike of Irem in Arabia Felix, the other on the original vestiges of Arabian literature ('Recueil de l'Acad. des Inscriptions,' vol. xlviii., old series; vol. x., new series). In the same year De Sacy was nominated a member of a committee of the Academy which was appointed to make analyses and extracts from the most important inedited works in the Royal Library; and there is scarcely a volume of the collection entitled 'Notices et Extraits,' &c., which does not contain some notice by him of a Persian or Arabic work. Among his contributions the most remarkable are his 'Biographies of Persian Poets' (vol. iv.), and a notice on four Arabic works relative to the conquest of Yemen by the Othomans in the 16th century (vol. iv.). Shortly after he wrote his admirable memoirs on various antiquities of Persia, and deciphered the Pehlvi inscriptions of Nakshi-Rostem, near the ruins of the ancient Persepolis. He also gave the various readings on the medals of the Sassanian kings, together with an abstract of their history translated from Mirkhond. The whole was published in 1793, in 1 vol. 4to.

During the revolutionary period De Sacy withdrew with his family to a small country-house some leagues from Paris, and devoted himself entirely to the study of Oriental literature. Among his labours at that time are his 'Researches into the Religious Tenets and Customs of the Druses,' which however were not published till shortly before his death. In 1795 a school for teaching living Oriental languages being instituted by a decree of the Convention, De Sacy was appointed professor of Arabic. He then gave all his attention to the composition of an Arabic grammar, which he compiled chiefly from the works of native grammarians; and about the same time (1799) he published his 'Principles of General Grammar,' of which a third edition appeared in 1815, 12mo, Paris. In 1805 De Sacy was sent by the imperial government to Genoa for the purpose of examining certain Arabic manuscripts which were said to exist in the archives of the city; and on his return to Paris in 1806 he made a report to the Academy on the historical documents which he had found there. In the same year De Sacy was appointed professor of Persian, and he published his 'Chrestomathie Arabe,' or a selection of extracts from various Arabian writers, both in prose and verse, by far the most valuable work for the use of students that has yet appeared. In 1810 his Arabic Grammar, the fruit of fifteen years' almost incessant labour, was published, as well as his translation of Abd-al-latîf's account of Egypt ('Relation de l'Egypte,' &c., 4to, 1810). About the same time he published a 'Memoir on the Orthography and Manner of reciting the Korân' ('Not. et Ext.,' vol. viii.), and was likewise one of the most zealous contributors to the 'Magasin Encyclopédique,' the 'Mines de l'Orient,' and the 'Annales des Voyages.'

On the return of the Bourbons in 1814, De Sacy, who had received from the imperial government the title of baron, became a member of the Chamber of Deputies, and was also appointed a member of the Council for Public Instruction. He took a prominent part in founding the Asiatic Society of Paris, of which he was the first president. In 1816 he published, under the title of 'Calila et Dinna,' the Arabic text of the Fables of Bidpai, and the Moallakah (or suspended poem) of Lebid, with a French version and critical notes. In 1819 appeared the 'Pend-Nameh' (Book of Counsels), in Persian and French, with copious notes. The whole of the 'Makamat' (Sessions) of Hariri, in Arabic, with a commentary also in Arabic, was his next publication, the edition being made with so much care that it met with a ready

sale even in eastern countries. In 1826-27 De Sacy published a new edition of his 'Chrestomathie Arabe,' with corrections and considerable additions; and in 1829 he added a supplementary volume, entitled 'Anthologie Grammaticale Arabe.' The second edition of his Arabic Grammar appeared in 1831. In 1832 Louis-Philippe elevated De Sacy to the peerage, and appointed him keeper of the Oriental manuscripts in the King's Library, and perpetual secretary to the Academy of Inscriptions. De Sacy's last work was his 'Exposé de la Religion des Druses,' which appeared at the beginning of 1838, in 2 vols. 8vo. On the 19th of February of the same year, as De Sacy was returning from the Chamber of Peers, where he had taken an active part in the debate, he fell in the street in a fit of apoplexy. He was removed to his house, where he died on the following day, in the eightieth year of his age.

Oriental literature is greatly indebted to the labours of this distinguished scholar. He not only contributed to extend our knowledge of every branch of Oriental literature, but it was on his recommendation that professorships of Chinese, Sanskrit, and Hindostanee were established in Paris; and it was also under his direction that the Russian and Prussian institutions for Oriental studies were raised to their present eminence. A very able paper, giving an account of De Sacy's life and writings, was read on the 23rd of June 1838 before the Academy, by M. Reinaud, who was his personal friend. It has since been published under the title of 'Notice Historique et Littéraire sur M. le Baron Silvestre de Sacy.'

SADI. [SAADI.]

SADLER, SIR RALPH, the eldest son of Henry Sadler, Esq., was born at Hackney in Middlesex, in 1507, where his family had been for some time settled. In early life he gained a situation in the family of Thomas Cromwell, earl of Essex, who introduced him to the notice of Henry VIII., by whom he was employed in the dissolution of the religious houses, and he had his full share of their spoil. In 1537 he commenced a long series of diplomatic services in Scotland; in the first instance, chiefly with the view of detaching that country from its close alliance with France, and persuading the king of Scotland to imitate his uncle's conduct towards the see of Rome and the clergy. In these objects however he failed. In 1540 he lost his patron Cromwell, who was beheaded; but he retained his favour with Henry, who again sent him to Scotland in 1541. Upon the death of James V., Sadler lent his aid to the match projected by Henry VIII. between his son Edward and the young queen of Scotland, but this ended so unsuccessfully, that in December 1543, Sadler was obliged to return to England, and Henry declared war against Scotland. In the meantime Henry was so satisfied with Sadler's services, even in this last negotiation, that he included him by the title of Sir Ralph Sadler, Knight, among the twelve persons whom he named as a privy-council to the sixteen nobles to whom in his will he had bequeathed the care of his son and of the kingdom. When this will was set aside by the protector Somerset, and it became necessary to conciliate the king's executors and privy-councillors by wealth and honours, Sir Ralph Sadler received a confirmation of all the church lands formerly assigned to him by Henry, with splendid additions. At the battle of Pinkie, Sir Ralph Sadler greatly distinguished himself, and was raised to the degree of knight-banneret on the field of battle; but we hear nothing more of him during the reign of Edward VI., except that in the fourth year of that king we find him mentioned as master of the great wardrobe. In Queen Mary's reign, although he appears to have been in her favour, he retired to his estate at Hackney, and resigned the office of clerk of the hanaper, which had been conferred upon him by Henry VIII.

On the accession of Elizabeth he again appeared at court, was called to the privy-council, and retained to his death a large portion of the esteem of that princess. He was a member of her first parliament as one of the knights of the shire for the county of Hertford. When Elizabeth thought proper to favour the cause of the Reformation in Scotland, and to support the nobility who were for it against Mary, Sir Ralph Sadler was her principal agent. He was also concerned in the subsequent measures which led to the death of Mary, and was appointed her keeper in the castle of Tutbury; but such was Elizabeth's jealousy of this unfortunate princess, that even Sadler's watchfulness became liable to her suspicions, and on one occasion a heavy complaint was made against him that he had permitted Mary to accompany him to some distance from the castle of Tutbury, to enjoy the sport of hawking. Sir Ralph Sadler expostulated upon the miserable life which he passed at Tutbury, and upon the misconstruction put upon his actions, and Mary was finally committed to a new keeper. Elizabeth however did not withdraw her confidence from Sir Ralph Sadler in other matters, and, after the execution of Mary, employed him to go to the court of James VI. to dissuade the Scotch king from entertaining thoughts of a war with England on his mother's account, to which, there was reason to think, he might have been excited. In this Sir Ralph had little difficulty in succeeding, partly perhaps from James's love of ease, and partly from the prospect he had of peaceably succeeding to the throne of England. This was the last time Sir Ralph Sadler was employed in the public service, for soon after his return from Scotland he died, at his lordship of Standon in Hertfordshire, March 30, 1587, in the eightieth year of his age, and was buried in the church of Standon, where his monument was

decorated with the king of Scotland's standard, which he had taken at Pinkie.

The transactions of Sir Ralph Sadler's most memorable embassies are recorded in 'Letters and Negotiations of Sir Ralph Sadler, &c., printed at Edinburgh,' 8vo, 1720, from manuscripts in the Advocates' Library; but a more complete collection was published of his 'State Papers and Letters,' edited by Arthur Clifford, Esq., of Tixal, his descendant, in 2 vols. 4to, in 1809, to which was added, a 'Mémorial of the Life of Sir Ralph Sadler,' by Mr. (afterwards Sir) Walter Scott, with historical notes: to which the preceding account is principally indebted.

SADOLETO, JACOPO, was born at Modena in 1477, and studied at Ferrara, and afterwards at Rome. He applied himself especially to the Greek and Latin classics, and became a distinguished scholar. Leo X. appointed him one of his secretaries, together with Bembo, and afterwards made him bishop of Carpentras in the county of Avignon, but still kept him at Rome. After Leo's death, his successor, Adrian VI., who had no partiality for learned men, neglected Sadoleto, who repaired to his diocese of Carpentras. When Clement VII. ascended the pontifical throne, in 1523, he appointed Sadoleto his secretary. But Clement's tortuous and selfish policy disgusted Sadoleto, who asked and obtained leave to return to his diocese, and accordingly he left Rome about a month before Bourbon and his band sacked the city. At Carpentras he wrote several works; among the rest, a learned commentary on the Epistle of St. Paul to the Romans. Some expressions in this commentary, which referred to the abstruse doctrines of predestination and grace, were considered heterodox at Rome, and his work was prohibited. Sadoleto wrote to Paul III., who had succeeded Clement VII., an explanation of his opinions, which satisfied the pope, and Sadoleto was cleared of all suspicion of heresy. Soon after he was made a cardinal, and was employed in several important affairs. In 1542 he was sent as legate to Francis I., to mediate a peace between that king and the Emperor Charles V., in which however he did not succeed. In 1544, being old and infirm, he obtained leave to resign his see of Carpentras in favour of his nephew Paul Sadoleto, whom he had educated himself, and withdrew into retirement. He died in 1547. His unspotted character, the mildness of his manners, his sincere piety, and his love of letters, have caused him to be compared with Fénelon.

Sadoleto wrote a work on education, 'De Liberis recte Instituendis,' which contains much excellent advice. He also wrote a disputation, in two books, on the merits of philosophy, on the model of Cicero's 'Tusculanae,' which Bembo praised greatly, as worthy of the Augustan age. A poem which he wrote in Latin hexameters, on the discovery at Rome of the group of the Laocoon, was likewise much admired.

SAFARIK, PAL JOZSEF, is the Bohemian form of the name of an eminent antiquarian and philological author, who has adopted the Bohemian language as the vehicle of his literary productions, after having composed his early writings in German, in which his name is generally spelt Schafarik, or Schaffarik. He was born on the 30th of May 1795, at Kobeljarowo in Northern Hungary, where the Slovakian, which is the common language, is so akin to the Bohemian spoken in the neighbouring kingdom, that Safarik, the principal native prose writer, and Kollar [KOLLAR], the leading native poet, have both ranged themselves in the ranks of Bohemian authors. After studying in his native country, and then at the University of Jena, Safarik became a professor at the college of Neusatz in Southern Hungary, where a different Slavonic dialect is the language spoken; but in 1833 he threw this up, and fixed his residence at Prague, to devote himself to the study of Bohemian, and to edit the 'Journal of the Bohemian Museum,' which remained under his management from 1832 to 1842. In the year 1848 he was appointed keeper of the university library at Prague, and he took a great share in the Bohemian agitation of that year, which was crushed by the cannon of Windischgratz. [PALACKY.] This did not prevent his appointment by the Austrian government, in 1849 and in 1851, as president of the committee, to examine the old legal technical terms and invent new ones, in connection with the project of publishing the laws in each of the five Slavonic languages of the Austrian empire—the Bohemian, Ruthenian, Croatian, Serbian, and Slovakian. Safarik's writings are numerous, but all have a bearing on the subject of the Slavonic languages and literature. The principal is his 'Geschichte der slavischen Sprache und Literatur nach allen Mundarten' (a 'History of the Slavonic Language and Literature in all its Dialects'), Buda, 1826, which is a great storehouse of literary information, but rather a bibliographical catalogue than a history, the principal feature being its very full lists of titles of books. His 'Slowanské Starozitnosti' ('Bohemian Antiquities'), Prague, 1837, and his 'Slowansky Narodopis' ('Slavonic Ethnology'), Prague, 1842, contain the results of his researches into the origin and early history of the Slavonic nations. They have been translated into various languages, and are now among the first books referred to by all investigators of the subject. His other works are chiefly dissertations of less extent on kindred themes.

SAGE, LE, ALAIN-RENÉ, was born May 8, 1668, at the village of Sarzeau, which is situated on the peninsula of Ruis in the département of Morbihan, in France, about ten miles from Vannes, the capital of that département. His father, Claude Le Sage, who was a lawyer, and held the office of registrar of the Cour Royale of Ruis, died in 1682;

he bequeathed a moderate property to his son, and entrusted both son and property to an uncle, who sent young Le Sage to be instructed in the Jesuits' college at Vannes, where he became an especial favourite of Père Bochard, then at the head of that college, who bestowed much pains on his education. The uncle is said to have dissipated the property, and young Le Sage, on leaving the college, appears to have obtained and held for five or six years an office in the collection of the taxes in his native province of Brittany.

Le Sage, having been deprived of his office, went to Paris in 1692, with the intention of going through a course of philosophy and law, and at the same time of making interest to obtain another situation. His handsome person and agreeable manners, his talents, and his taste for elegant literature, procured him admission to the best society. In 1694 he married the daughter of a citizen of Paris. Danchet, with whom he had become intimate while prosecuting his studies in the University of Paris, persuaded him to produce, from the Latin version of Jaques Bongars, the Letters of Aristænetus, which is rather an imitation than a translation. It was printed in 1695 at Chartres, but with the imprint of Rotterdam, 1 vol. 12mo, at the expense of Danchet, who was then professor of rhetoric at Chartres.

Le Sage had been admitted avocat au parlement de Paris, but he subsequently dropped the designation, and also relinquished some small office which he held, in order that he might devote himself to literature. The Abbé de Lyonne became his patron, and bestowed upon him a pension of 600 livres; and to him also Le Sage appears to have been indebted for his introduction to the Spanish language and literature. He now produced 'Le Traître puni,' a comedy in five acts, imitated from the 'Traición busca el Castigo' of F. de Roxas (Paris, 1700); 'Don Felix de Mendocé,' taken from a piece by Lope de Vega (Paris, 1700); and 'Le Point d'Honneur,' a comedy in five acts, from the 'No hay Amigo para Amigo' of F. de Roxas, which was performed at the Théâtre Français, but with little success. The two first plays were not represented, and the last, when he afterwards reduced it to three acts, and brought it out at the Théâtre Italien in 1725, under the title of 'L'Arbitre des Différends,' was only played twice. Le Sage's next effort was 'Les Nouvelles Aventures de Don Quichotte,' translated from Avellaneda's frigid continuation of the work of Cervantes (2 vols. 12mo, 1704-6). This translation obtained as little favour from the French public as the original had from the Spanish.

Le Sage was now thirty-eight years of age, and his labours had hitherto been to little purpose; but he had been training himself for a brighter display of his powers. He had made himself familiar with the literature of the Spanish drama, unrivalled for its richness of invention; he had been filling his mind with Spanish scenes, and incidents and characters drawn from that great storehouse; and he had been perfecting his style, originally formed on the sound principles of a classical education, by free translations. In 1707 'Don César Ursin,' a comedy in five acts, imitated from Calderon, was performed at the Théâtre Français without success, while a little piece of his own, 'Crispin, Rival de son Maître,' played at Paris on the same day, had a brilliant run, and indeed is said, in liveliness, interest, and especially truth of dialogue, to be hardly inferior to Molière. Soon afterwards appeared his 'Diable Boiteux,' of which he had borrowed the name and the leading idea from 'El Diabolo Cojuelo' of Luis Velez de Guevara, and of which indeed it is properly a continuation (Paris, 1707). Its success was prodigious, which was no doubt in a great measure owing to much of the satire being aimed at contemporary characters of eminence in Paris; but the true drawing and rich colouring of its pictures, which are copied from all ranks of society, and its nervous, clear, and correct style, have made its reputation lasting. In 1726 he augmented the work by an additional volume, and in 1737 added to it the 'Entretien des Cheminées de Madrid,' and 'Les Bequilles du Diable Boiteux,' the first a continuation of the work by Le Sage himself, and the last a eulogy of it by the Abbé Bordelon.

Le Sage had offered to the Théâtre Français a piece in one act called 'Les Etrennes,' which was to have been performed January 1, 1708, but the actors refused to play it; upon which Le Sage extended it to five acts, and gave it the title of 'Turcaret.' The piece was levelled at the corruptions of those who managed the revenue and farmed the taxes, the maltotiers, traitants, and others of that class. This powerful body being aware of the aim of the piece, of which Le Sage had read some parts to his literary friends, used their utmost exertions to prevent its performance, and even offered the author, it is said, 100,000 francs to suppress it, but he refused the bribe. They had better success however with the players, and would have triumphed, if an order of Monseigneur, dated October 13, 1708, had not been addressed to the actors in these terms:—"Monseigneur having been informed that the king's company object to perform ('font difficulté de jouer') a piece entitled 'Turcaret, ou le Financier,' commands them to learn it and to play it forthwith." The performance took place February 14, 1709, and the success was even greater than had been anticipated. This comedy is entirely Le Sage's own, and is greatly superior to any of those which he had borrowed from the Spanish. A little piece called 'La Tontine,' which had been accepted at the Théâtre Français, was, owing to intrigue within or without the theatre, not performed till 1732. Disgusted with this and other conduct of a similar kind, Le Sage resolved to relinquish the legitimate drama and the royal

theatre. We find him in 1710 assisting his friend François Petis de la Croix, who was then beginning to publish his 'Mille et Un Jours,' by correcting the language and improving the style of the translation.

Le Sage's next work was his novel of 'Gil Blas de Santillane,' 2 vols. 12mo, were published in 1710, vol. 3 in 1724, and vol. 4 in 1735.

Three different and indeed discordant charges have been made against this work.

The first charge was made by Bruzen de la Martinière, and followed up by Voltaire, who says ('Siècle de Louis XIV.') that the novel is entirely taken from the 'Relaciones de la Vida del Escudero Don Marco Obregon' of Vincent Espinel. This charge was soon found to be as absurd as it was malignant, by merely looking into Espinel's work, which presents no resemblance to the work of Le Sage either in the narrative, the characters, or the dialogue.

The next charge was made by the Jesuit Father Isla, who translated 'Gil Blas' into Spanish, and gave it the title of 'Gil Blas de Santillana buelto á su Patria.' This work was completed by the Père Isla at Bologna in Italy, in 1781, but was not published till 1787 (Madrid, 4 vols. 4to). Isla died in 1783. He asserts that 'Gil Blas' was originally written in Spanish in 1635; that the work was denounced to the government of the day, which prohibited the printing of it, and seized the manuscript; but that the author, having had time to take a copy, fled with it to France, where he died in 1640; that this manuscript having accidentally fallen into the hands of Le Sage, he formed his 'Gil Blas' out of it. It has been asserted that a manuscript, apparently that which had been seized from the author, is still in the Escorial, and that this manuscript is evidently not a translation from the French work. This statement is disproved by the facts that Isla translated Le Sage's work, and not the original, that such original has never been published, and that there is no evidence of its having ever been seen.

These two charges were examined and refuted by Le Comte François de Neufchâteau, in an 'Examen de la Question de savoir si Le Sage est Auteur de Gil Blas, ou s'il l'a pris de l'Espagnol,' 1819.

Another charge was made by the Jesuit Llorente, in a small volume published in 1822, 'Critical Observations on the Romance of Gil Blas,' in which he asserts that it is taken from an unpublished work called 'The Bachelor of Salamanca.' We have not the means of examining into the particulars of this charge, but have no doubt that it is just as unfounded as the two former.

Le Sage had ceased, as we have said, to write for the Théâtre Français, but he had three sons and a daughter, for whom the means of respectable subsistence must be procured. Le Sage's character was one of independence, and he seems to have had a preference for the fruits of honest industry at a time when place and pension were eagerly and unscrupulously sought for by literary men in France. High as his reputation had now become, he was not ashamed to employ about six-and-twenty years of his life—1713 to 1738—in writing small pieces for the theatrical exhibitions at the fairs of St. Germain and St. Laurent. Fuzelier, D'Orneval, Autrau, Piron, Lafont, and Fromaget were his fellow-labourers. Upwards of one hundred pieces were produced in the period above mentioned, of which Le Sage was the sole author of twenty-four, and conjointly of many of the others. These pieces, with hardly an exception, were excessively popular. He published the greater part of them, in conjunction with D'Orneval, in a collection which they called the 'Théâtre de la Foire,' 9 vols. 12mo, and 10 vols. 12mo.

In the meantime however Le Sage was occupied with other compositions. His 'Roland l'Amoureux,' an imitation rather than a version of Bojardo's 'Orlando Innamorato,' was published in numbers from 1717 to 1721. He is said to have got rid of most of the exaggerations of the Italian, but to have lost his fire. In 1732 appeared 'Les Aventures de Guzman d'Alfarache,' a compressed imitation of 'La Vida y Hechos del Picaro Guzman de Alfarache' of Aleman, but superior to the original, and which has entirely superseded the previous translations. In the same year he published 'Les Aventures de Robert dit le Chevalier de Beauchesne,' 2 vols. 12mo. This work is not properly a fiction, but a narrative of the extraordinary adventures of a pirate, extracted from the memorials furnished by his widow. This was followed in 1734 by the two first parts of 'L'Histoire d'Estevanille Gonzalez, surnommé le Garçon de bonne Humeur,' 2 vols. 12mo, which Le Sage professes to be an imitation of 'El Escudero Obregon' before mentioned, but to which it bears little resemblance except in a few circumstances of narrative which have been borrowed. In 1735 he published 'Une Journée des Parques,' 12mo, a dialogue full of philosophy and wit, the thoughts bold and original, and expressed with great energy. This was also the year in which he completed 'Gil Blas,' a work which he seems to have written especially for posterity, and to which he devoted a large portion of the best period of his life. In 1738, the year in which he produced the last of his little operas, he published 'Le Bachelier de Salamanca,' 2 vols. 12mo, and in 1740 'La Valise trouvée,' 12mo, anonymously, which consists of about thirty letters, supposed to be written by different persons, on satirical subjects. His last work was 'Un Mélange amusant de Saillies d'Esprit et de Traits Historiques les plus frappants,' 1 vol. 12mo.

Le Sage appears to have passed his life of literary activity in great domestic happiness, which was only disturbed by his eldest and his

third son having become actors, a profession to which Le Sage had a strong dislike. He had brought his eldest son up to the bar, but he left it, and, under the assumed name of Montménil, acquired a high reputation as an actor. Le Sage had ceased to have any intercourse with him; but the second son, who had obtained the preferment of a canon at Boulogne-sur-Mer, contrived, by a *manœuvre*, to get the old man to see his son play a character in 'Turcaret,' with which he was so much delighted that a reconciliation took place, and they afterwards lived on terms of the greatest friendship. It is related that while Montménil was at the theatre, Le Sage passed his evenings at a café in the neighbourhood of his residence, where the company used to assemble round him, and to get upon chairs and tables to listen to "the old man eloquent." The death however of this favourite son, in September 1743, at the age of forty-eight, was a severe blow for him.

At the end of 1743 he retired to Boulogne, with his wife and daughter, in order to be near his son the canon, and here he died November 17, 1747. His wife survived till 1752: both of them died at the age of eighty.

The great work of Le Sage is his 'Gil Blas,' perhaps of its kind the first of all novels, and one that has the rare merit of always being read with new pleasure. This superiority is not owing to the interest of the story, for when a story is well known a novel loses that part of its attraction, and its permanent success must depend on other qualities. When a person has finished a chapter of 'Gil Blas,' he will generally have nearly equal pleasure in beginning to read it over again; and the reason is this—'Gil Blas' is a series of pictures of human life under all its aspects. The various adventures of Gil Blas concern us little; we only recollect him because of the persons with whom through him we become acquainted. We neither like him nor dislike him; we certainly do not admire or respect him. He introduces us to a great variety of personages of all classes and conditions, whose failings and vices are painted in enduring colours. Though somewhat of the interest of the novel arises from the great variety of adventures, and the delineation of manners peculiar to Spain, it is as a gallery of portraits that the work will always maintain its interest. It is true that the author generally gives us the portraits of rogues or fools, or of persons whose distinguishing trait is some weakness of character; but it is also true that the portraits are likenesses, and represent a large class. As in all great works of the kind, the author is never obtruded on us. We think not of the wonderful art which has produced what appears to be completely simple and natural. It would be difficult to find an idle or unmeaning phrase in the whole book—at least in the first two volumes, which in many respects are the best. The expression is suited to the thought with perfect propriety; there is nothing superfluous, and nothing wanted in the way of explanation. While we admire the innumerable delicate touches which make up the whole of a picture, we find them blended in one harmonious whole, to which each part bears its just proportion; a merit which arises from the author's clear perception of what was required for the delineation of each character, and the exquisite taste which guided him to the adoption of a pure, simple, and nervous style of expression. A great work or a great intellectual power of any kind is always the fruit of mature years. Le Sage, as already observed, published the first two volumes of 'Gil Blas' in 1715, when he was forty-seven years of age, and the fourth and last in 1735, when he had attained his sixty-seventh year.

The greater part of the works of Le Sage were collected and published under the title of 'Œuvres Choies de Le Sage,' 15 vols. 8vo, Paris, 1783, and 16 vols. 8vo, 1810. Most of his novels have been frequently reprinted, but especially 'Gil Blas,' which has appeared in all forms, from the most splendid typography and embellishments to the humblest. It has been translated into all the languages of Europe: the English translation is by Dr. Smollett. 'Le Diable Boiteux' is translated into English under the title of 'The Devil on Two Sticks;' and we have also translations of the 'Bachelor of Salamanca,' and of most of the other novels.

SAID IBN BATRIC, the name of a person more commonly known by the appellation of EUTYCHUS (Εὐτυχίος, Arabic Εὐφίστιχους), which signifies 'Happy' in Greek, as 'Said' does in Arabic. He was born A.H. 263 (A.D. 875), at Fostat in Egypt, and was originally brought up as a physician; and we are told by Ibn Abi Osaibiah ('Oïon Al-Ambâ fi Tabacât Al-Atebbâ,' 'Fontes Relationum De Classibus Medicorum,' cap. 14, sec. 10) that he excelled both in the theory and practice of that profession, and that he composed a work on the subject of medicine. But it is as an historian that he is best known, and as one of the Melchite patriarchs of Alexander, to which dignity he was raised A.H. 321 (A.D. 933), and assumed upon the occasion the name of Eutychius. He died A.H. 328 (A.D. 940). His principal work is a general history of the world, from the creation to his own time, written in Arabic, and edited by Pocock, 2 vols. 4to, Oxon, 1656, Arab. and Lat., with the title 'Nadhm Al-Jauahir: Contextio Gemmarum, sive Eutychii Patriarchæ Alexandrini Annales' (both the title and the date however vary very much in different copies: see Nicoll and Pusey, 'Catal. MSS. Arab. Bodl. Biblioth.,' pp. 47 and 501). This is styled by Gibbon, chap. 51, note m., "a pompous edition of an indifferent author, translated by Pocock to gratify the Presbyterian prejudices of his friend Selden," who defrayed the expense of the work, and promised to add some annotations, which however his death in 1654 prevented

him from contributing. He had himself published a small portion of the same work, entitled 'Eutychie Egyptii, Patriarchæ Orthodoxorum Alexandrini—Ecclesiæ suæ Origines,' Arab. and Lat., 4to, Lond., 1642, with a learned commentary. He selected this particular chapter, because his "Presbyterian prejudices" were delighted at finding in it that St. Mark, in founding the church at Alexandria, appointed a college of twelve presbyters, or elders, who, whenever the patriarchate was vacant, elected one of their own number to fill the office. This little extract of Selden's was very severely criticised in a work entitled 'Eutychiuss Patriarcha Alexandrinus vindicatus, et suis restitutus Orientalibus; sive Responsio ad Joannis Seldeni Origines, auctore Abrahamo Eccheleni, Maronita ex Libano,' 4to, Romæ, 1661. Three other smaller works are mentioned in Wüstenfeld, 'Gesch. der Arab. Aerzte,' but this only has been published. (Nicoll and Pusey, *Catal. MSS. Arab. Biblioth. Bodl.*; D'Herbelot, *Biblioth. Orient.*; Schnurrer, *Biblioth. Arab.*, p. 144.)

SAINT-ARNAUD, MARÉCHAL LEROY DE, was born in Paris, of poor parents, on the 20th of August 1798. Having entered the Royal Body-Guards at the age of sixteen, he rose to the rank of sub-lieutenant in the infantry of the line in 1818. Owing to some youthful vagaries, he left the army shortly after and embraced the theatrical profession, when he first performed at the suburban Théâtre des Batignolles. In this new vocation he continued upwards of ten years, but the revolution of July revived his taste for martial life; he returned to the army in 1831, and having entered the 64th regiment as sub-lieutenant, was made full lieutenant within six weeks. The insurrection of the partisans of the Duchesse de Berri, in La Vendée, soon afforded him an opportunity of earning the favourable notice of Marshal Bugeaud. He was subsequently appointed to the charge of the citadel of St. Blaye, where the Duchesse de Berri was confined—a post in itself from the circumstances somewhat painful to an honourable man, and his conduct in it incurred for him considerable odium.

In 1836 Saint-Arnaud was sent to join the army in Algiers, with the rank of captain; he behaved with much gallantry at the siege of Constantine, and received the decoration of the Legion of Honour. The brilliant courage he displayed in these campaigns obtained for him the rank of commandant of the 18th regiment of infantry in 1840, but his erratic disposition induced him to quit it to enter the Zouaves the same year. In 1842 he was created lieutenant-colonel; and in 1844, on the recommendation of Bugeaud, he became colonel of the 32nd regiment. During the next three years he was constantly in the field, his reputation increased, and he was made major-general in 1847. In 1850 he was appointed to command the province of Constantina, which was then in a very unsettled state; but he subdued the whole country within the year. In the early part of 1851 General Saint-Arnaud was despatched on an expedition against the Kabyles, which was entirely successful, and was considered one of the most brilliant campaigns of the French in Algeria. His little army did not amount to 7000 men, and with this he overran that rugged country, and in spite of a desperate resistance he conquered the whole province. This was the service which fixed upon him the attention of the president of the republic.

Saint-Arnaud returned to Paris in the autumn of 1851 as general of division. Louis Napoleon at once took him into his confidence, giving him the command of the second division of the army of Paris immediately after his arrival, and then appointing him minister of war. He acted cordially with the prince-president: "Nothing," he wrote to his mother, November 19, 1851—"nothing in this world is wanting, but to go straight forward and be bold." In the famous coup d'état of the 2nd of December following he was the prince's chief adviser and instrument. Honours now accumulated upon him: he was made marshal of France, then a senator, and received the grand cross of the Legion of Honour in 1852. His health had gradually declined under so harassing a life; yet he so strongly solicited the command of the French army intended for the east, at the outbreak of the war with Russia, that his request was granted. The events of that war are so recent that we need not dwell upon them. It will be enough to say that Marshal Saint-Arnaud entered upon it with the utmost eagerness. He evidently felt that a splendid chance was afforded of professional distinction. For a time his impetuosity enabled him to bear up under his constantly-increasing malady. The landing in the Crimea, which he calls his "favourite idea," he tried to the utmost to hasten forward; and fearing at last that his life was ebbing, he insisted on forward movements, regardless of the opinions of his colleagues. On the morning of September 20, 1854, Marshal Saint-Arnaud mounted his horse with great difficulty, and by the constant exercise of great spirit sustained all the fatigues of command during the battle of the Alma. He exhibited the same energy in his despatch after the victory, but the intensity of his feelings is only fully seen in his letters to his wife, published in the collection referred to below. But the effort proved too much for his remaining strength: his malady increased daily, and on the 27th he was obliged to embark on board the Berthollet to return to Constantinople. He died on the 29th of September, whilst yet on his passage.

The career of Marshal Saint-Arnaud, almost up to the outbreak of the Russian war, shows him too much in the light of a daring and not very scrupulous adventurer; and he did not live long enough, when a nobler field was opened to his ambition, to show whether he

possessed the abilities of a great general. But while in his last days, as in his earlier, he exhibited the most brilliant and dashing courage, combined with judgment and energy, devotion to his duty was never so strongly evinced as at the close of his career. Two volumes of his private letters have been published by his brother, 'Lettres du Maréchal de St.-Arnaud,' Paris, 1855, which, though exhibiting many suppressions, give much curious information respecting the last twenty-five years of his remarkable career.

SAINT-CYR, MARÉCHAL LAURENT-GOUVION DE, was a native of Toul, where he was born, April 13, 1764. His father, though but a poor tanner, contrived to give his son a good education. Young Gouvion, who had a natural taste for drawing, desired at first to become an artist, and spent some years as a professional drawing-master. In 1785 he was induced to try his fortune on the stage, and frequently appeared at the Salle-Beaumarchais, in the Marais, in the part of a brigand. His fine stature appeared to favour his pretensions; but he was shy and nervous, and lisped a good deal.

In 1789, after the capture of the Bastille, Saint-Cyr embraced with ardour the principles of the revolution. In August 1792 he enlisted as a chasseur, and was sent to the frontier; but his large stature, and the advantages he derived from a good education, drew notice upon him, and in 1793 he was already a captain. He then became assistant (adjoint) to the adjutant-generals, and whilst in that post served under Custine, Beauharnais, Landremont, Carlen, and others, most of whom were sent to the guillotine. For a time he steadily refused promotion, and courted obscurity to save his life; but the year 1794 saw him both a general of brigade and a general of division. In 1796 he served under Jourdan on the Rhine, and then under Moreau, both of whom he has since severely criticised in his military 'Memoirs.' In 1797 the Directory appointed him commander-in-chief of the army of Rome, where the cruel extortions of Massena had excited great murmurs. In 1804 he was made colonel-general of the Cuirassiers, and in 1805 grand officer of the Legion of Honour. General Gouvion Saint-Cyr behaved with great gallantry at Castel-Franco, November 18, 1805; and having again distinguished himself during the campaigns of Prussia and Poland, he was named governor of Warsaw in 1807.

He was next sent to the peninsula, where he added to his reputation by the defeat of Castro, and the capture of Barcelona. He now stood very high in the confidence of Napoleon I., and having been called to take part in the campaign of 1812, on the invasion of Russia, he received the command of the 6th corps d'armée, with generals De Wrede and Deroi as his lieutenants. On the 18th of August 1812 he fought the battle of Polotsk against Wittgenstein, defeated that general with the loss of 7000 Russians, and left the field with a loss on his side of scarcely 2000 men. For this brilliant achievement he was at once created a marshal. After the battle of Leipzig, Marshal Saint-Cyr was under the necessity of capitulating with his corps of 16,000 men. He took no part during the Hundred Days; and having joined the fortunes of the Bourbons, and steadfastly adhered to them, he was loaded with favours by Louis XVIII. and Charles X. In 1817 he was appointed governor of the 5th Military Division; he then received the grand cross of the order of St. Louis; and was made a count, and finally a marquis. In September 1818 he became minister of war. Marshal Gouvion de Saint-Cyr died at the Hières on the 12th of March 1830, and his body having been removed to Paris, he was buried in the noble church of the Invalids, between Turenne and Lannes. He was the author of several military works which are still held in high esteem.

ST. EVREMOND. [EVREMOND, ST.]

\* SAINT-HILAIRE, AUGUSTE, a French botanist of eminence, was born at Orleans (Loire), in France, on the 4th of October 1799. He is more especially known for his travels in the Brazils and his great work on the Brazilian Flora, entitled 'Flora Brasiliæ Meridionale,' which was published with plates in folio at Paris in 1825. He has also published smaller works on the more remarkable plants of the Brazils, and those which are most common in that country. His travels in the diamond districts of the Brazils and in the provinces of Rio de Janeiro and Minas Geraes have been published in separate volumes. They contain a large amount of information on the natural products as well as of the inhabitants and other particulars of the interior of this part of South America. His works have deservedly obtained for him a high position amongst travellers and botanists. He is a member of most of the great Societies of Europe that cultivate the natural sciences. Besides the works above mentioned he has contributed a large number of papers, more especially on botanical subjects, to the scientific journals of Paris. He has also published on the plants of France, and is extensively acquainted with the plants of Europe.

SAINT-HILAIRE, GEOFFROY-ETIENNE, was born at Etampes, in France, the 15th of April 1772. He was destined by his father for the church, and received the appointment to a canonry in his twelfth year. He was however sent to the college of Navarre, where Brisson lectured on experimental philosophy, and under him he acquired a taste for the natural sciences. He first devoted himself to mineralogy, in which Haüy was his preceptor. On coming to Paris he studied very diligently, and in 1793 was appointed subcurator and demonstrator of the Natural History cabinet, in the Jardin des Plantes. He was subsequently appointed professor of zoology, and lectured conjointly with Cuvier. In 1798 he accompanied the French expedition

to Egypt. He was made a member of the Institute in 1807, and appointed professor of anatomy and physiology in the faculty of sciences in 1809. He was sent by the government on a scientific expedition to Portugal in 1808. In 1815 he was returned as a member of the Chamber of Deputies for his native city of Etampes. He died at Paris in July 1844.

Geoffroy St-Hilaire was one of the most assiduous cultivators and ablest expounders of what is called philosophical anatomy. The idea on which this department of science was founded had been developed in Germany, and successfully applied to zoology and comparative anatomy during the latter part of the last century. It was however amongst the rich collections of the Jardin des Plantes, and the activity and zeal of such men as Cuvier, Lamarck, Temminck, Desmarest, Valenciennes, Serres, and St. Hilaire, that it received its most important applications and its greatest development. The fundamental idea of this system is the unity of the composition of the various parts of an organic body, and that this unity is capable of expression in a few simple laws. What, in fact, might be predicated in botany of the various parts of a plant by a knowledge of the structure of the leaf, might, in the same way, be predicated of the structure of animals by a knowledge of certain fundamental parts of their organisation. Thus Geoffroy St-Hilaire, amongst his other labours, established the fact that the numerous bones of the head of the fish, and by consequence those of the higher animals, were transformations of the simple vertebra; and that the laws of development which applied to the one applied to the other.

These views equally applicable to every organ of the body, were generally developed by St. Hilaire in a work published in 1818, entitled 'Philosophie Anatomique,' which was illustrated with an Atlas of folio plates. He also published several papers and essays on the principles of philosophical anatomy. In 1828 a small work appeared as an introduction to the lectures delivered on natural history in the Jardin des Plantes on the principle of the unity of organic composition, with the title, 'Sur le Principe de l'Unité de Composition Organique,' 8vo. Although previous to the time of Geoffroy the morphological idea lying at the basis of philosophical anatomy had been applied to the explanation of the phenomena of abnormal forms of animals, just as it had been of plants, yet the subject had not been fully developed. In 1822 he published his great work on the anatomical philosophy of human monsters. These beings, which had formerly been regarded as mere unaccountable freaks of nature, were now found to be the result of the action of fixed laws, and their various forms susceptible of the strictest classification. This work contained a new classification of monsters, with a description and comparison of their different forms, and a history of the various causes supposed to produce them. It also comprehended some new views on the nutrition of the fœtus, and an accurate estimate of the phenomena attending the development of the sexual organs in the male and female fœtus, in which the author pointed out the fact of a unity of composition in the reproductive apparatus of the two sexes in birds and mammalia.

A list of the papers which St. Hilaire contributed to the various departments of natural history would be very long. There is scarcely a branch of zoology to which he did not successfully apply the great principles of his anatomical philosophy; and few indeed are the works on natural history published during the present century that do not bear testimony to the great influence he has exerted. At the same time the views held by the school, at the head of which Geoffroy St. Hilaire may be justly placed, have led to great controversy. Fully as Cuvier was impressed with the importance of Geoffroy's works, he opposed him in some of his conclusions, and this led to a controversy which developed, in these inquiries, a theological element; Geoffroy St. Hilaire opposed the doctrine of final causes, as being in opposition to the theory of a unity of composition. In his philosophy he states that he knows nothing of 'intentions' or 'objects' in creation; and when Cuvier spoke of the part an animal "had to play" in nature, he rejoined that there were no "animals which had a part to play in nature." This controversy has since, in this country, assumed a popular form; and it is obvious, from the use made by the advocates of the doctrine of final causes, of the principles of the 'Anatomical Philosophy,' that this theory is not incompatible with their views. We may add that Owen and other great comparative anatomists of the present day are strongly opposed to many of the conclusions of M. Geoffroy St. Hilaire.

A complete edition of the works of Geoffroy St. Hilaire has been published in France under the title of 'Professional Studies of a Naturalist,' in 42 volumes. Etienne Geoffroy St. Hilaire left behind him a son, Isidore, who has successfully cultivated the favourite science of his father. A complete list of Etienne Geoffroy St. Hilaire's works will be found in Callisen's 'Medicinisches-Schriftsteller Lexicon.'

ST. JOHN. [BOLINGBROKE.]

\* ST. JOHN, JAMES AUGUSTUS, was born in Caermarthenshire, about the beginning, or a little before the commencement of the present century. He was instructed in the village grammar-school, where he distinguished himself by his early proficiency, and by his efforts at self-culture, acquiring, in addition to the classics there taught, a knowledge of the French, Italian, Spanish, Arabic, and Persian languages. When only seventeen he came to London, and commenced

writing for the press, an occupation he has since steadily followed. For a while he was editor of a newspaper published at Plymouth in which he advocated principles of freedom far in advance of those then in fashion. His first work was 'Abdallah,' an oriental poem; and soon after returning to London, he became sub-editor of the 'Oriental Herald,' then issued by Mr. James Silk Buckingham; and for this he wrote a history of the rise and progress of the British power in India. In 1827, in conjunction with Mr. D. L. Richardson, he started the 'Weekly Review,' in opposition to the 'Literary Gazette,' but it failed of success. In 1829, he with his family, visited Normandy, and a 'Residence in Normandy' was the result, published in two volumes. In 1830 he removed to Paris, where he wrote 'The Lives of Celebrated Travellers,' for Colburn's 'National Library,' and published a collection of his earlier essays under the title of 'The Anatomy of Society.' In 1832 he went to Switzerland, where he left his wife and family, and travelled over a great part of Egypt, visiting on his way back Malta, Sicily, and Naples. On his return to England in 1834 he published the result of his travels in a work called 'Description of Egypt and Nubia;' and in 1834-35 were published 'The Hindoos,' in two volumes, for 'The Entertaining Library,' issued under the superintendence of the Society for the Diffusion of Useful Knowledge. In 1835 he returned to France, taking up his abode at Chantilly, where he prepared his work 'On the Manners and Customs of the Ancient Greeks,' which however was not published till 1842, in three volumes. In the latter part of his labours on this work he was afflicted with blindness, and his son Bayle St. John acted as his amanuensis. He has also written three novels, 'Tales of the Ramadhan,' 'Margaret Ravenscroft,' and 'Sir Cosmo Digby;' with other works, as 'Isis, an Egyptian Pilgrimage,' 'There and Back Again,' 'The Nemesis of Power, or Causes and Forms of Revolution,' 'Philosophy at the Foot of the Cross,' with innumerable contributions to periodical works. He has likewise edited the works of Locke, the prose works of Milton, Sir Thomas More's 'Utopia,' Sir Thomas Brown's 'Religio Medici,' and Bunyan's 'Pilgrim's Progress.' Three of his sons, Bayle, Percy, and Horace, have also attained some celebrity in the literary world.

\* ST. LEONARDS, EDWARD BURTENSHAW SUGDEN, BARON, was born in London in 1781, devoted himself to the study of the law, entered himself at Lincoln's Inn, and was called to the bar in 1807. But earlier than this he had manifested his eminent qualifications for the profession he had chosen by the publication, in 1805, of 'A Concise and Practical Treatise of the Law of Vendors and Purchasers of Estates.' This work "was certainly the foundation of my early success in life," as he himself states in a thirteenth edition, published in 1857. It supplied a want, its value was recognised by all professional men, fresh editions were repeatedly called for, and the author took care, by improving upon each, to add to his reputation, which also concurred to increase his practice as a conveyancer, to which branch of his profession he at first confined himself. In 1808 he published his 'Practical Treatise on Powers,' which has gone through seven editions; and which possesses great legal excellence, but like the previous work, derives its character and its value from his knowledge and exposition of laws, orders, precedents, and decisions, rather than from any wide view of the equitable principles upon which they are founded, or ought to be founded. Of a more popular character was his next work, 'A Series of Letters to a Man of Property, on Sales, Purchases, Mortgages, Leases, Settlements, and Devises of Estates,' a small volume published in 1809, of which several editions have been printed. The letters were intended as a practical guide to unprofessional men, and were written so as to be intelligible to all, enabling any one to judge how far he could depend upon his own ability in managing his transactions, and where he should have recourse to professional assistance. In 1811 he published 'The Law of Uses and Trusts,' a posthumous work of Chief Baron Gilbert, the principal value of which consists in the Introduction and Notes supplied by the editor. The character of these various works had procured for him an extremely large business as conveyancer and chamber counsel, with frequent occasions for acting as counsel in the common law courts, and he ceased to appear as an author, except in occasional pamphlets upon legal subjects, and in preparing new editions of his previous works. In 1817 he gave up his chamber practice and confined himself to that of the chancery bar, where in a short time his assistance was eagerly sought in all the most complicated cases, and when in 1822 he was made king's counsel he obtained the leading business in that court. In 1828 he entered Parliament as member for Weymouth. He was not distinguished as a debater, but his knowledge of law made him a valuable adherent, and in 1829 he was promoted to the office of solicitor-general and knighted under the administration of the Duke of Wellington. His tenure of office only lasted till the accession to office of Earl Grey and the Whigs in 1831. In 1835, during the short administration of Sir Robert Peel, Sir Edward Sugden was Lord Chancellor of Ireland. Returning to England he took an active part in the House of Commons as member for Ripon, and on Sir Robert Peel's accession to office again in September 1841 he resumed the duties of Lord Chancellor of Ireland, which he continued to perform with general satisfaction till July 1846, when Lord John Russell succeeded Sir Robert Peel. During his release from professional duties, he prepared a volume entitled 'A Treatise on the Law of Property,

as administered in the House of Lords,' published early in 1849, in which he examines and criticises the decisions given in the House of Lords, when acting as a court of appeal; and in 1851 'An Essay on the New Real Property Statutes.' In February 1852, on the accession of the Earl of Derby to the ministry, Sir Edward Sugden was appointed Lord Chancellor of England, and created a peer, as Lord St. Leonards. While acting in this capacity he issued a set of rules and orders for proceedings in Chancery, of which the advantages were considered very doubtful, but his judgments were generally prompt, and the reasons assigned for them clear and satisfactory. In December of the same year, he had again to resign his post, but has continued to take an active part in politics as an adherent of the party that looks up to the Earl of Derby as its head.

SAINT-SIMON, LOUIS DE ROUVROY, DUC DE, the writer of the celebrated 'Memoirs of the Court of France under Louis XIV. and his Successors,' was born of a family who claimed descent from the old counts of Vermandois, on the 16th of January 1675. He was presented at the font by Louis XIV. and Maria Thérèse of Austria, and received a careful education at home. When quite a youth he was entered in the corps of Mousquetaires, made his first campaign under Marshal Luxembourg in 1692, and distinguished himself by his valour at the siege of Namur and at the battles of Fleurus and Neerwinden. He rose rapidly to the rank of major-general, obtained the government of St. Blaye, and on the death of his father succeeded to his title. He then abandoned the military career, and resolved to devote himself to the court and diplomacy, for which his tastes and his talents more peculiarly fitted him. He had married, in 1695, the daughter of the Marshal de Lorges, his connections were high, and no one seemed more likely to succeed in his new course than himself; but Louis XIV. overlooked him, chiefly it is said on account of his independent character, so that, having abandoned arms and receiving no other employment, he occupied himself in studying and recording the characters of the court, the courtiers, and the ministers. A staunch aristocrat and a supporter of Jansenism in the latter days of Louis XIV., he became an opponent of Madame de Maintenon and the legitimate princes, a friend of Fénelon, and an active adherent of the Duke of Orleans, whose claims to the regency he powerfully advocated among the nobility of France even before the death of Louis. On the accession of Orleans to the regency he was made one of the council, and possessed considerable influence over the regent; but he declined being appointed governor to the young king. St. Simon however, though esteemed by the regent, and supporting his measures generally, was too independent to follow him servilely. He opposed the pretensions of the Jesuits; he strongly advised Orleans to preserve the parliament from its threatened destruction by Cardinal Dubois; he remonstrated against the financial projects of Law; but he was a peer and an aristocrat, though an honest one, and he equally opposed all measures of reform. In 1721 he was sent to Spain to negotiate a marriage of Louis XV. with the infanta, and another of the Prince of Asturias with a daughter of Orleans; and though the first failed, and the second was unhappy, he received testimonies from both courts of their satisfaction with him, and was created a grandee of Spain and knight of the Golden Fleece. On Louis XV. coming of age, in February 1723, the regency of Orleans terminated, and he died in the same year. With the death of Orleans the political life of St. Simon ended; he retired to privacy at his estate of La Ferté, occupied himself in writing his 'Memoirs,' and died at Paris on the 2nd of March 1755. His 'Memoirs' terminate with the death of the regent, though the writer lived so long after. The work, written with his own hand, was deemed by his family unfit for immediate publication (and indeed Saint-Simon had forbidden it), as many of the characters described were yet alive. They accordingly applied for and obtained a *lettre de cachet* for the deposition of the original manuscript among the national archives. Various applications were subsequently made at intervals by the family for the restoration of the manuscript, but ineffectually. After one of these applications, on the accession of Louis XVI., the Abbé Voisenon was appointed to examine it. The work was retained, but he made copious extracts and copies of it; these were surreptitiously obtained by means of a faithless servant, and printed in 7 vols. in 1788 and 1789. When the liberty of the press was proclaimed, Soullavie issued an edition in 1791, increased by some useless notes, in better order, but still incomplete, in 13 vols. 8vo. It was not till 1829-30 that, by the liberality of Louis XVIII., a complete edition was given under the title of 'Mémoires complets et authentiques du Duc de Saint-Simon sur le Siècle de Louis XIV. et la Régence; publiés pour la première fois sur le manuscrit original, entièrement écrit de la main de l'auteur, par M. le Marquis de Saint-Simon, Pair de France, &c., &c.,' in 21 vols. 8vo. In 1856-57 a new edition, printed in the first style of typography, collated with the original manuscript by M. de Chéruef, with an introductory notice by M. Sainte-Beuve of the French Academy, was issued at Paris in 20 vols., and no less than five other editions were published in Paris at the same time. The ground-work of the 'Memoirs' is the life of the author, but it is neither a history, journal, or a series of biographical characters, but a most interesting compound of all three. The style is somewhat rough, but the sincerity and honesty of the author, joined to his clear-sightedness in all that did not come into conflict with his immediate prejudices, and even these do not mislead his love

of truth, his vivid perception and lively delineation of character, and his store of illustrative anecdotes, constitute the work an invaluable picture of the historical events and of the life and manners of the age of Louis XIV. and of the regency. A translation by Bayle St. John of select portions of the 'Memoirs,' is now (May 1857) in the press.

SAINT-SIMON, CLAUDE-HENRI, COMTE DE, a man whose influence on the social philosophy of modern France, and to some extent also on the general thought of Europe, has been very great, was born at Paris on the 17th of October 1760. His grandfather was the Duc de Saint-Simon of the preceding article; but his father having lost the ducal title and property, St. Simon began life from a lower rank among the old French noblesse. After having received a general training under D'Alembert and other teachers, he adopted the course of life usual with young French nobles, and in 1777 went to America as an officer in the French army sent by Louis XVI. to assist the American colonists in their revolt against Great Britain. Even at this early age he was remarkable for restlessness, eccentricity, and a conviction that he was born to play a great part. His servant had instructions to awaken him every morning with these words: "Levez-vous, M. le Comte, vous avez de grandes choses à faire." After serving under Bouillé and Washington, and travelling in Mexico and other parts of the American continent, he returned to France. Here he held the honorary rank of colonel, but sought no farther opportunity of active service; being already convinced, he says, that his proper business was to "study the march of the human spirit in order eventually to labour for the advancement of human civilisation." His father's death in 1783 left him more his own master; and in 1785 and subsequent years he travelled in Holland and Spain. While in Spain he availed himself of his connections with the court there to press some projects for the material improvement of the country, and among them, one for making a canal to unite Madrid with the sea. The passion for social rectification was already strongly developed in him; but as yet there was little appearance of its assuming any definite or systematic form. Though he had returned to France in 1789, just before the outbreak of the revolution, and though—notwithstanding his aristocratic birth—his sympathies seem to have been wholly on the side of the movement, he did not, like Mirabeau and others of his order, take any direct part in it, but looked on as a mere spectator. In partnership indeed with a Prussian, Count de Redem, he bought a large quantity of the confiscated national lands, with some notion of founding a great scientific and industrial school; but the scheme came to nothing, and in 1797 Saint-Simon separated from Redem, and backed out of the speculation with a sum of 145,000 livres (6800*l.*) as the amount of his remaining fortune.

It was about this time, when he was already in his thirty-eighth year, that he began in earnest his career as a social theorist and reformer, or rather his studies preparatory to that career. His life, hitherto, had been vague and erratic; he had a conviction that human society required radical changes, and that men ought to be directed into new paths of activity; but, as to the precise nature of the social changes to be effected, or of the principles that ought to regulate men for the future, he was still ignorant. A "physico-political" reformation was necessary—that was all he could say; except this besides, that he felt himself called upon to be the reformer. For this purpose, he must educate himself systematically, furnishing himself with all the knowledge of the world up to his own day, so that he might start from the exact point at which humanity had arrived. In this extraordinary course of education he spent about ten years. It divided itself into two parts—first, that which was sheerly theoretical and intellectual; and, secondly, that which was experimental and emotional. 1. 'Theoretical Education.' This must consist, he said, in thoroughly acquiring all those contemporary scientific generalities in which the entire knowledge of the race was condensed and formulised. In this, notwithstanding his early education under D'Alembert and others, he considered himself deficient, and he set about remedying the deficiency. "Taking up his residence near the École Polytechnique, he devoted his whole attention for three years, according to his own methods, and with all the appliances that money could purchase, to the study of the physical sciences—mathematics, astronomy, general physics, and chemistry. Satisfied with his progress in these, he removed in 1801 to the neighbourhood of the École de Médecine, in order, in a similar manner to add to his stock of ideas regarding inorganic nature all the general science attainable regarding organised beings. Here, accordingly, in the company of eminent savans, he traversed the whole field of physiological science. Having thus imbibed all the contemporary scientific thought of France, it was necessary, according to his plan, that he should visit England and Germany, least, in either country, any ideas should be lurking of decided European value, though France had not recognised them." Out of these countries however he derived nothing which he thought important out of the circle of principles already accessible in France; and he accordingly "concluded that, in having made these principles fully his own, he had taken in the entire essence of all the contemporary thought of the world." 2. 'Experimental Education.' This, as distinct from the first, was to consist in "the actual realisation in his own person of the whole range of human situations and emotions," so as to break down the limits which begirt him as a nobleman and a Frenchman, and enable him to fraternise with humanity in every phase. One of his first experiments

was marriage. The lady he married was Mademoiselle de Champgrand, the daughter of one of his fellow officers in the American expedition. The experiment did not answer; it was ended after a few years by a divorce by mutual consent; and, childless by the first marriage, the lady contracted a second. "Both during and after his marriage," says one of Saint-Simon's biographers, "he continued to pursue, in the most indefatigable manner, his prescribed career of experimentation. Balls and dinners followed each other in rapid succession; every new situation that money could create was devised and prepared; good and evil were confounded, play, discussion, and debauch were alike gone into; the experience of years was crushed into a short space; even old age was artificially realised by medicaments; and, that the loathsome might not be wanting, this enthusiast for the universal would inoculate himself with contagious diseases." Such a course Saint-Simon justified to himself by distinguishing between a man who undertook it from sheer love of pleasure and a man who undertook it in the spirit of the highest theoretical philosophy and for great ends. The one was going to perdition; the other would emerge supremely virtuous. Saint-Simon himself, at all events, emerged supremely poor. In 1807, about which time his course of education ended, he was in such abject poverty that he was glad to accept the post of clerk in a Mont de Piété, or Government Loan-office, at a salary of about 40*l.* a year. Subsequently he lived on the charity of an old friend named Diard; on whose death, in 1812, he was again destitute.

It was high time now that Saint-Simon should be setting about his "mission." He was now fifty-two years of age, about which time, according to his own scheme of a model life, a man, after having gone through the process of education, ought to begin "to resume his observations and to establish theories." Accordingly it was in 1812, when his circumstances were at their worst, that he gave to the world his first publication, entitled 'Letters from an Inhabitant of Geneva to his Contemporaries.' In this work he propounded the germs of his social philosophy, and in particular that peculiar distinction between the spiritual and the temporal powers to which his system attached so much importance—the distinction being in fact an adaptation of the mediæval distinction of the Romish Church to modern society, so as to make all men of thought take the place of the spiritual order, while the rest of society should constitute the temporal. "The spiritual power in the hands of the *savans*; the temporal power in the hands of the men of property; the power of naming the individuals called to perform the functions of leaders in the hands of the masses; for salary to the governing class, the consideration which they receive." Such was the compendium given of the Saint-Simonian politics. The 'Letters' were followed by an 'Introduction to the Scientific Labours of the Nineteenth Century,' suggested by the demand which Napoleon I. had addressed to the Institute, for a general account of the progress of science in Europe since 1789. In this work, Saint-Simon denounced what he called the "anarchy" prevalent in the intellectual world, and propounded his notions as to the means of attaining intellectual order.

It was about the time of the Restoration that, struck by the originality of the thought and the style of the foregoing works, a few ardent young men gathered round Saint-Simon, as pupils round a master. Among his first disciples were M. Olinde Rodrigues, a young Jew; M. Augustin Thierry, since so well known as a historian; and M. Auguste Comte, the future author of the so called 'Positive Philosophy.' Such pupils probably brought as much as they received; but Saint-Simon exercised over them the fascination of an enthusiast, and implanting in them his general doctrines, he directed their efforts and prescribed their separate tasks. In 1814, there appeared, 'The Reorganisation of European Society; or on the necessity and the means of uniting the peoples of Europe into one body-politic, preserving to each its own nationality; by Henri Saint-Simon and Augustin Thierry.' Besides this work in conjunction with Thierry, Saint-Simon published in 1819 a small pamphlet entitled 'Parabole,' in which the superiority of the industrial classes on the one hand and the intellectual classes on the other, over the classes usually held in social esteem, was asserted with much pungency and wit. A prosecution was grounded on this tract as being of revolutionary tendency; but the result was an acquittal. The doctrines of this tract were more methodically expressed in subsequent writings—particularly in the 'Catechisme des Industriels.' In this work "he takes a retrospective view of the course of French history, dividing it into several epochs and showing what interests were predominant in each. Then, having established these two propositions—first, that the industrial classes are the most useful to society; and secondly, that the proportion of these classes to the rest of society has been continually increasing—he proceeds to predict the downfall of the existing military and feudal régime and the establishment in its stead of a new or industrial régime." In this work Saint-Simon announced another, in which the 'Scientific System of Education' corresponding to the coming era should be discussed theoretically, under his auspices, by his pupil M. Auguste Comte. When the 'Système de Politique Positive' of M. Comte however did appear (the germ of the work subsequently developed into the well-known 'Cours de Philosophie Positive' of the same author) Saint-Simon was but partially pleased with it. It expounded his system of politics, he said, from the Aristotelian point of view, and neglected too much the sentimental and religious elements.

New pupils—including M. Bazard and M. Enfantin—were attaching themselves to the little Saint-Simonian band; but still the progress was so small, that the founder in his poverty and obscurity began to despond. On the 9th of March 1823 he attempted suicide; but, the pistol being misdirected, he recovered with the loss of an eye. Clearly by this time his faith in his own views and in his own destiny, had passed the ordinary bounds of intellectual dogmatism and had assumed something of the character of a 'craze.' His last bequest to the world was to be a new Religion! The exposition of this new Religion was given forth in his 'Nouveau Christianisme' (1825), which may be regarded as Saint-Simon's own final summary of his views. "In this work the ruling idea is that Christianity is a great progressive system, rolling, as it were, over the ages, acting on the thoughts and actions of men, but continually imbibing in return fresh power out of the mind of the race and retaining only as its eternal and immutable principle this one adage 'Love one another.' Of this great progress of Christianity, the first stage, according to Saint-Simon had been Catholicism. After it had come the Protestantism of Luther. Lastly, he, Saint-Simon, was the harbinger of a new and triumphant stage—the Saint-Simonian phase of Christianity." So far as the nature of this new or Saint-Simonian Religion was defined, its peculiarity was to rest on two principles—the one relating to the end after which humanity was to strive; the other to the means whereby this end was to be attained. "The most rapid possible amelioration, physical and moral, of the condition of the class the most numerous and poor;"—such was the first principle, defining the end prescribed by the new Religion for all the efforts and labours of humanity. To the attainment of this end, however, a right organisation of society was indispensable; and the principle of this organisation or reconstruction was formulised as follows:—"To each man a vocation according to his capacity, and to each capacity a recompense according to its works." From this last principle it will be seen that Saint-Simon was the reverse of an Equalitarian or Communist. The cardinal maxim of his system, indeed, was that nature had made men unequal in capacities, and that the right organisation of society was that of a hierarchy of ranks, graduated according to capacity and not according to any artificial method.

In order to assist in the popular diffusion of his views, Saint-Simon, with the assistance of his pupils, founded a journal called 'Le Producteur.' This was the last act of his life. On the 19th of May 1825, he died, after much ill-health and suffering, at the age of sixty-five. His favourite pupils—Rodrigues, Thierry, Comte, Bazard, and Enfantin—were with him to receive his last instructions. "It has been imagined," he said, "that all religion must disappear. But religion cannot disappear from the world: it can only change its form. Do not forget this, and remember that, in order to do great things, one must be enthusiastic (pour faire de grandes choses il faut être passionné)." This was said especially to Rodrigues, and probably with some reference to Comte, whose difference from his master in the matter in question was already decided.

The history of Saint-Simonianism after Saint-Simon's death is very curious. The 'Producteur' was carried on by Rodrigues, with the help of Bazard, Enfantin, and others, while Comte seceded and struck out a career of his own, in the course of which, according to some, he has been rather unfair to the memory of his master. In the 'Producteur' however there were expounded only the more practical views of Saint-Simon relating to the re-organisation of industry and the like: the more esoteric views being kept back. Some of the liberal politicians of France who had no affection for Saint-Simon or his doctrines—as, for example, Armand Carrel—were thus among the writers in the journal. Meanwhile, however, the more fanatical Saint-Simonians were active in other ways; and Saint-Simonianism, as a religion, and not a mere collection of doctrines which might be criticised and discussed, was spreading among the younger minds of France. At last, M. Bazard, clothing himself in the mantle of his dead master, announced himself as his successor, and advertised a course of lectures on his creed. Rodrigues and Enfantin joined him, and fresh pupils attached themselves, some of whom, as MM. Hyppolite Carnot, Michel Chevalier, and Charles Duveyrier, have since acquired a high name in France, quite apart from Saint-Simonianism. These formed a little church; a kind of mystical theosophy was propounded, with the ideas of Saint-Simon in the middle of it; and the believers regaled each other with speculations as to the coming future of the world, when society should be arranged on Saint-Simonian principles, and the supreme law should reside in a Saint-Simonian pontiff or universal chief, topping a magnificent hierarchy of intellectual men, all working and all paid according to their capacities. While indulging in these dreams however the sect did not lose sight of actual society and actual politics. They directed their assaults in particular against the law of inheritance, as a part of the existing system which, in the interests of Saint-Simonianism, they ought to break down. That men should bequeath property, and thus place their heirs in artificial places of power, was contrary, they said, to the true idea of hierarchy according to personal merit.

In 1830 the Associates started a weekly journal in Paris called 'L'Organisateur.' They also dwelt together in the Rue Monsigny—Bazard and Enfantin acting as joint-presidents of the establishment. These two men were very different in character—Bazard being the more shrewd and logical, Enfantin the more fervid and fanatical.

Scarcely had the Saint-Simonian establishment been formed, when the revolution of July 1830 occurred. The Associates, like other sects, did not miss the opportunity of making a demonstration; and for some days all Paris was puzzled with a placard signed "Bazard-Enfantin," which was posted on the walls. When the government of Louis-Philippe was established, some inquiries were made as to the proceedings of the Saint-Simonians, and they were denounced in the Chamber of Deputies as holding and propagating dangerous doctrines, more especially the doctrines of communism and of community of women. In reply they stated that, while they desired some changes in the laws of property, their system was based on principles directly contradictory of community; also, that they did not attack the institution of marriage, but desired to see women possessed of full social and civil rights. On the whole, the sect made great progress during the first months of Louis-Philippe's reign. Among their most celebrated converts was M. Pierre Leroux, then at the height of his reputation as a philosopher and editor of 'The Globe' newspaper. By his accession this important journal became the professed organ of Saint-Simonian opinions (January 1831). The result was an immense increase of the sect in Paris and all over France; the recruits being chiefly from the young of the highly-educated classes and among literary men and artists. Branch establishments were set up in Lyons, Montpellier, and other towns in connection with the parent church of Paris; and Saint-Simonianism, both pure and applied, was preached in every possible manner.

A schism soon occurred in the Saint-Simonian church itself—the cause of the schism being differences among the leading men on several points of doctrine, but most of all, on the subject of the future of women—Enfantin held extreme views on this subject, urging that Saint-Simonianism ought to decree the complete social equality of the sexes, and that, meanwhile, man should impose no laws upon women. "The only position of the true Saint-Simonian," he said, "in regard to woman, is to declare himself incompetent to judge her. The woman must herself reveal to us all that she thinks, all that she desires as to the future." Bazard and others, including Leroux, differed from Enfantin on these points so decisively that they at last (November 19, 1831), formally seceded, leaving Enfantin, with Rodrigues as his subordinate, to carry on the society after his own fashion. The doctrine of "the coming woman," for a time caused great excitement in Paris; and Père Enfantin and his lectures and evening-parties, were the topics of the day. A prosecution instituted by government, want of money, and farther differences between Enfantin and Rodrigues, led at length to the dissolution of the Society of the Rue Monsigny; and the publication of the 'Globe' ceased at the same time.

The final vagary of Saint-Simonianism was the most curious of all. Enfantin, with about forty faithful adherents (among whom were Michel Chevalier and Charles Duveyrier) removed to a house, with large grounds attached, at Menilmontant, near Paris, and constituted themselves into a kind of Saint-Simonian monastery, of which Enfantin was abbot. They all dressed alike in a peculiar costume of which a red cap formed a part; and they divided their time between manual labours and intellectual exercises, which were to a great extent of a mystical religious character. A prosecution was instituted against this establishment; and on the 27th of August 1832, the whole body appeared in court. Judgment was given against them, and Enfantin was sentenced to a term of imprisonment. From that time Saint-Simonianism as a society, or even as a creed, was extinct; but it is interesting to remark how largely the Saint-Simonian notions have tinged modern French thought, and how many of the men who have been eminent in France, in all departments, during the last twenty years, belonged at one time to the Saint-Simonian school. In the subsequent career of most of those there is no trace of that flightiness which the fact of their having been Saint-Simonians might be supposed to argue. The quondam Saint-Simonian chiefs, we believe, have also proved themselves able men of business, and have been largely connected with railways and other such undertakings, conducting themselves on ordinary principles, whatever may be their speculative recreations. For more minute information respecting Saint-Simon and Saint-Simonianism, the works mentioned in this notice must themselves be consulted; there are, however, various popular sketches of the subject, of which that by M. Louis Reybaud in his 'Études sur les Réformateurs Contemporains,' is one of the best.

SALADIN. [SALAH-ED-DEEN.]

SALAH-ED-DEEN (MALEK-AL-NASSER SALAH-ED-DEEN ABU-MOD-HAFFER YUSEF), better known to European readers by the famous name of SALADIN, was born A. D. 1137 (A. H. 532), in the Castle of Tecriit on the Tigris, of which his father Ayub, a Koor of the tribe of Ravendooz, was governor for the Seljookian sovereign of Persia. Ayub and his brother Shirakoh subsequently transferred themselves to the service of Zenghi, 'atabek' of Syria, by whose son, the famous sultan Noor-ed-deen [NOUREDIN], they were raised to high military honours; and when Shirakoh (in 1163) was appointed general of the troops designed to reinstate the vizir Shawer in Egypt, a subordinate command was entrusted to his nephew, whose disinclination to the service was overruled by the express mandate of Noor-ed-deen. In 1166 he again accompanied Shirakoh into Egypt, where his defence of Alexandria for three months against the superior forces of the Franks of Palestine established his military reputation, and gained for

him, according to the Christian writers, the honour of knighthood from the king of Jerusalem, Amawry; but the Syrian forces were again compelled to evacuate the country, and it was not till the third expedition (1168) that the subjugation of Egypt was completed. Shirakoh now became, with the nominal rank of vizir to the Fatimide caliph, viceroy of the kingdom for Noor-ed-deen; but dying the same year, bequeathed his authority to his nephew, who continued to govern Egypt, assisted by the advice and experience of his father Ayub, who had been invited from Damascus to share the prosperity of his son. The last of the Fatimides, Aded Ledin'llah, still bore the title of kalif of Egypt; but even this shadow of schismatic sovereignty was hateful to the bigotry of Noor-ed-deen; and in obedience to his orders, his lieutenant deposed the Fatimide dynasty by a simple ordinance that the 'khotbah' or public prayer should be read in the name of the Abbasside caliph Mostadhi; and Aded opportunely dying eleven days after, this important revolution was effected (A. D. 1171, A. H. 567) "without so much" (in the words of Abulfeda) "as two goats butting at each other."

The extinction of the Fatimides left Salah-ed-deen virtually sovereign of Egypt; and though in compliance with the prudent counsels of his father he continued to render every external mark of allegiance to Noor-ed-deen, he pertinaciously evaded all the requisitions for military assistance addressed to him by his liege lord, who was preparing to enforce obedience by arms, when Salah-ed-deen was spared the odium of this ungrateful contest by the death of Noor-ed-deen, A. D. 1173, A. H. 569. Malek-al-Saleh Ismail, Noor-ed-deen's heir, a boy eleven years old, was inadequate to the weight of empire: disputes speedily arose among his emirs, and Salah-ed-deen availed himself of the confusion to seize Damascus, which he occupied unopposed (1174). Emesa, Hamah, and other towns dependent on Damascus shared its fate; and when Malek-al-Saleh attempted to regain them by the aid of his cousin Seif-ed-deen Ghazi, atabek of Mosul, the combined forces were routed in two great battles, and Malek-al-Saleh, besieged in Aleppo, was forced to purchase peace by the cession of all southern Syria.

Salah-ed-deen now assumed the title of Sultan and all the prerogatives of established royalty, and extended his dominions by the conquest of most of the petty sovereignties on the frontiers of Syria and Mesopotamia. The Ismailis, or Assassins of Lebanon, whose emissaries had attempted his life at the siege of Aleppo, were also chastised and reduced to submission; but in his first encounter with the Franks of Palestine he sustained a disastrous defeat near Ramla from Reginald de Chatillon, Nov. 1177, A. H. 573. The four next years were spent principally in Egypt, the affairs of Syria being conducted by his lieutenants; but in 1182 he quitted Cairo for the last time, and resuming his encroachments on the territories of the atabeks, captured in succession Edessa, Amida, Nisibin, &c.; and though repulsed before Moussoul, succeeded (1183) in possessing himself of the long-coveted city of Aleppo, by a convention with Amaded-deen Zenghi II, who had succeeded Malek-al-Saleh. From Yemen to Mount Taurus in Cilicia, and from Tripoli in Africa to the Tigris, the continuity of the rule of Salah-ed-deen was now interrupted only by the Latin kingdom of Jerusalem; and the violation by Reginald de Chatillon of a four years' truce, concluded in 1185, soon afforded a pretext for hostilities. In the famous battle of Hittin, or Tiberias (July 1187, A. H. 583), the Christians, betrayed by the Count of Tripoli, were utterly overthrown; the king, Gui de Lusignan, was taken prisoner, and received by the victor with royal generosity; while his partner in captivity, Reginald de Chatillon, was decapitated, as a punishment for his perfidy, by the hand of Salah-ed-deen himself. All the towns of the Frank kingdom, Acre, Beirout, Ascalon, now rapidly fell before the arms of the sultan; and his triumph was crowned by the capture of Jerusalem, which surrendered after a siege of fourteen days (October 2, 1187), after having been eighty-eight years subject to the Franks. The two next years were principally employed in reducing the fragments of the Latin dominion; but Tyre was successfully defended by Conrad of Montferrat, and the appearance of the third Crusade (1189) enabled the Christians again to take the field. The two years' siege of Acre (1189-91) is memorable in the history of the Crusades. The kings of France and England, Philip-Augustus and Richard Cœur-de-Lion, animated by their personal exertions the efforts of the besiegers, while the Moslems, directed by the sultan, strove with equal zeal for the relief of the invested fortress: "never" (in the words of Gibbon) "did the flame of enthusiasm burn with fiercer and more destructive rage;" but Acre was at length forced to capitulate, and the Crusaders advancing along the coast, took Caesarea and Jaffa, while Ascalon, after an incessant battle of eleven days during the march, was only saved by being dismantled and rendered untenable.

In the spring of 1192 hostilities were resumed; and the Franks, led by the king of England, penetrated to within a short distance of Jerusalem, where Salah-ed-deen awaited their attack; but the dissensions of the Crusaders occasioned their retreat; and both sides, wearied by the never-ending struggle, were not unwilling to listen to terms of accommodation. The first extraordinary proposal of Richard, that Malek-al-Adel Seif-ed-deen, brother of Salah-ed-deen, should, after embracing Christianity, marry his sister and become king of Jerusalem, though seriously entertained for a time, was ultimately abandoned; and the three years' truce which was concluded, September 1192

(A.H. 588), left Jerusalem to the sultan, while the Christians were confirmed in possession of the coast from Jaffa to Tyre. Salah-ed-deen survived only a few months the termination of the war. His constitution was broken by the constant toil to which he had for many years been subjected; and a bilious fever which had seized him at Damascus, carried him off after twelve days' illness, March 4, A.D. 1192 (Sefer 29, Abulfeda; not 27, as stated in the 'Art de Verifier les Dates,' A.H. 589), aged fifty-seven lunar years, of which he had reigned more than twenty, reckoning from the death of Noor-ed-deen.

The popular tales of the shroud displayed for a standard as an emblem of departed greatness, and of the equal distribution of alms among Moslems, Christians, and Jews, are unnoticed by Oriental writers, and are probably fictitious. The character of Salah-ed-deen has been, like that of his predecessor Noor-ed-deen, a favourite theme for eulogy among the writers both of the East and the West. The historian Abulfeda, who was himself descended from a collateral branch of the Ayubite family, and the cadhi Bohadin (whose biography of his sovereign and friend has been rendered familiar by the edition of Schultens, Leyden, 1755), are scarcely more profuse than the Christian chronicles of the Crusades in their panegyrics on the valour, justice, and magnanimity which shone conspicuous in the life and actions of the sultan of Egypt and Syria. His ingratitude to the family of his early benefactor Noor-ed-deen, and the insatiable ambition which led him to despoil so many minor princes of his own faith, are more than atoned for in the eyes of the Orientals by his exploits in the holy war against the Frank invaders of Palestine, and by the rigid justice which he administered impartially to the meanest suppliant for redress; and his generous humanity to the helpless multitude of captives which fell into his hands at the capture of Jerusalem may be favourably contrasted with the massacre of the garrison of Acre, after the capitulation, by the orders of Cœur-de-Lion. The supremacy of his power and virtues was recognised by the voluntary homage of contemporary princes; and Abulfeda relates that on one occasion his stirrup was held by Kaisar-Shah, a Seljookian prince of Anatolia, while Ala-ed-deen, atabek of Moussoul, of the race of Zenghi, arranged his robes after he had mounted. His zeal for the improvement of his territories was attested by the erection of numerous fountains and caravanseras, particularly on the road to Mecca; and the numerous public-buildings with which he decorated his first and favourite realm of Egypt, though attributed in the lapse of years, from the similarity of name, to the patriarch Joseph (Yusef), still remain as monuments of his splendour.

At the death of Salah-ed-deen, his vast dominions were again divided: the three eldest of his sixteen sons received the kingdoms of Egypt, Damascus, and Aleppo, while the others were provided with appanages under the suzerainty of their brothers; but discord speedily succeeded, and the dominions of the first-named branches were eventually seized by their uncle Seif-ed-deen (the Saphadin of Christian writers), whose son Malek-al-Kamel was married to the only daughter of Salah-ed-deen. The branch of Aleppo maintained itself longer; and on the extinction of the Ayubites descended from Seif-ed-deen in Egypt and Damascus, by the revolt of the Baharite Mamelukes, A.D. 1250 (A.H. 648), the reigning sultan of Aleppo, a great grandson of Salah-ed-deen, and bearing, like his ancestors, the titles of Malek-al-Nasser Salah-ed-deen Yusef, succeeded in reuniting Damascus to his dominions; but ten years later his power was overthrown by the irruption of the Moguls from Persia; Malek-al-Nasser submitted to their leader Hulagu-khan, and was put to death by his orders, A.D. 1260 (A.H. 658), and with him ended the direct line of Salah-ed-deen.

SALE, GEORGE, a learned Oriental scholar, was born in 1680. Very little is known of his private life, except that he was a lawyer. He was a contributor to the 'Universal History,' edited by Swinton, Dr. Campbell, and others, and he wrote for that work the cosmogony, besides several valuable fragments of Oriental history, in which he was deeply versed. He was likewise one of the authors of the 'General Dictionary' (Lond., 1734, 10 vols. 4to), which contains a translation of that of Bayle. But the work by which he is best known is a translation of the Korán into English, from the original Arabic, with explanatory notes and quotations from Zamashkhari Beydâwi, and approved commentators. To this version, which in point of fidelity will bear a comparison with the excellent Latin translation by Marracci, published in 1698, Sale prefixed a preliminary discourse on the social and religious state of the Arabs, Jews, and Christians at the time of Mohammed's appearance [MOHAMMED]; on the doctrines inculcated in the Korán; on the principal sects among the Mohammedans; and on various other subjects connected with Islâm (Lond., 1734, 4to). This discourse was afterwards translated into French, and prefixed to the French version of the Korán by Duryer (Antw., 1770, 2 vols. 8vo). Sir James Porter, in his 'Observations on the Religion, Law, Government, and Manners of the Turks' (Lond., 1768, p. 60), has accused Sale of making an apology for the Korán, rather than trying to point out the pernicious doctrines contained in that book. The charge however is wholly groundless, as every scholar acquainted with the writings of the Mohammedan divines will readily admit. Sale was one of the founders and a member of the first committee of a Society

for the Encouragement of Learning, instituted in 1736. He died in the same year (14th November 1736), leaving one son. Soon after his death a catalogue of his Oriental MSS. was published, containing many choice articles in Arabic, Persian, and Turkish literature. They are all now in the Radcliffe Library, Oxford, for which they were purchased.

SALERINITANA SCHOLA, or 'School of Salerno,' the earliest school in Christian Europe where medicine was professed, taught, and practised. Salerno, from its connection with Constantinople and the Saracens, became the centre of the united learning of the Latins, the Greeks, and the Arabians; and hence it was one of the first cities in Europe where the sciences awoke from the slumber of barbarism. Amongst other arts, it was celebrated very early for the profession of medicine, and its first fame was derived from the extraordinary cures said to have been performed by the relics of Saint Archelais. This lady, with two other holy virgins, Thecla and Susanna, suffered martyrdom in the persecution of Diocletian, about the year 293, and their remains were at length deposited in the church of the Benedictine nuns of Saint George at Salerno. (Anton. Mazza, 'Histor. Epit. de Rebus Salern.', Neap., 4to, cap. vi., 1681.) In an ancient chronicle, quoted by Mazza, it is said that the first founders of the school of Salerno were Rabinus Elinus, a Jew; Pontus, a Greek; Adala, a Saracen; and Salernus, a Latin, who taught medicine in their respective languages, but at what era is not mentioned. (Anton. Mazza, 'Salern. Hist.', cap. ix.) Though medical works had never been wanting in the dark ages, and the works of Hippocrates and Galen were translated into Latin as early as the 6th century, yet this art was principally derived from the Arabians, who likewise learned it from the Greeks. After that warlike people had softened into habits of peace and luxury, by the encouragement of their kalifs, and particularly of Al-Mamouin, at the beginning of the 9th century, they applied themselves to learning. Many of the Greek writers were translated into Arabic; and the philosophy of Aristotle, and the art of medicine by Hippocrates and Galen, became their favourite studies. In their frequent visits to the port of Salerno, the knowledge which they freely communicated was eagerly received there and diligently cultivated. For many centuries the most able professors of medicine were the higher prelates and the superior monks. Subsequently, by the councils of Lateran in 1139, of Tours in 1163, and the decrees of Honorius III. in 1216, the clergy and monks were prohibited from exercising the professions of advocates and physicians, but they still continued the practice.

Connected with the city of Salerno by its vicinity, and the similarity of its literary pursuits, was the monastery of Mount Casino. Here and at Salerno great progress in the sciences had been made, when the arrival of *Constantinus Afer* commenced a new era of learning and fame. This celebrated man was born at Carthage. After thirty-nine years spent in study at Baghdad and in travel, he returned to his native country, master of all the learning then current in the world, and particularly of medicine. His talents excited the jealousy of his rivals, he was obliged to fly, and took refuge at Salerno in 1060. He was discovered by the brother of the kalif of Egypt, who happened to be in that city, and who recommended him to Robert Guiscard. By this prince he was patronised, and made his secretary. Having been converted to Christianity, he became a monk, and retired to the monastery of Mount Casino about the year 1075, where Desiderius was the abbot. He died in 1087, after having, by his wonderful cures, the multitude of books he wrote, and the number and fame of his scholars, raised the reputation of the School of Salerno to the greatest height. Some of his works have been printed (Basil, 2 vols. folio, 1536, 1539), and others remain in manuscript. The names of few of his disciples have been recorded. We find mention however of Atto, chaplain to the Empress Agnes, who translated the works of his master from various languages into Latin. (Pet. Diac., 'De Viris Illustr.', cap. xxix.) Another of his pupils was John, the physician, an eloquent and learned man, who published a book of aphorisms, and died at Naples, where he deposited the books written by his master. Gariopontus seems likewise to have been a contemporary. (Moreau, 'Prolegom.', p. 11.)

It may not be uninteresting to ascertain the other celebrated physicians of Salerno in the 12th century, and soon after the time when the 'Regimen Sanitatis Salernitanum' was written. The earliest whose name occurs is Nicolaus, who, amongst other works, wrote a book, still extant, entitled 'Antidotarium, upon medicines, which was thought to have been the summit of medical knowledge. [NICOLAUS PRÆPOSITUS.] It was commented upon by John Platearius, in the middle of the 12th century, and many other writers. Musandinus wrote upon diet, Maurus upon urine and phlebotomy. The specific works of John Castalius, Matthew Solomon, and Ricardus Senior are not enumerated. There were other learned men who studied medicine at Salerno in that century, but removed to other places, such as Saint Bruno, bishop of Signia, afterwards abbot of Casino, and again bishop, who died in 1126; Romualdus the second, archbishop of Salerno from 1157 to 1181, who attended William, king of Sicily, as his physician, in 1127; Saladinus Asculanus, physician to the Prince of Tarentum in 1163. (Aegidius Corbol.; Petrus Diac.; Mazza; &c.) Nor was the healing art confined to men only: there were many of the fair sex who were celebrated for their medical skill. The time when most of them lived is uncertain, but probably in the 11th, 12th, and 13th

centuries. Ordericus Vitalis speaks of a woman unequalled in medicine in 1059: "Rodulfus cognomento Mala Corona, Physice scientiam tam copiose habuit, ut in urbe Psalernitanâ, ubi maximas medicorum scholâ ab antiquo tempore habentur, neminem in medicinali arte, præter quamdam sapientem matronam, sibi parum inveniret" ('Hist. Eccl.', lib. iii., ad an. 1509, p. 477). Abella wrote a poem in two books, 'De Atrabile et de Naturâ Seminis Humani.' Mercurialis composed books 'De Crisibus,' 'De Febre Pestilenti,' 'De Curatione Vulnerum,' 'De Unguentis.' Rebecca, a work 'De Febris, de Urinis, et de Embryone.' Trotta or Trotula's book 'De Mulierum Passionibus ante, in, et post Partum' is allowed to be a forgery. Sentia Guerna lectured on medicine, and Constantia Calenda received the honour of the doctorate.

It would be tedious to mention all the learned men who studied physic at Salerno after the 12th century, of whom Mazza has given a long catalogue. From these we may however except John de Procida, a nobleman and physician of Salerno, the friend and physician of Manfred, king of Sicily, and the adviser of the Sicilian Vespers.

When the 'Regimen Sanitatis' was written, the professors contented themselves with the humble title of the School of Salerno. By the privileges of subsequent sovereigns, it was gradually constituted a regular university. Ruggiero, king of Sicily, about the year 1137, enacted a law that all who designed to practise medicine should be examined and approved by his officials and judges, under the penalty of the confiscation of all their goods. By 'officials' it is supposed that the physicians of Salerno were understood, as he had recently given great privileges to that city. The Emperor Frederic II., having established likewise a university at Naples, published edicts for its government, which were finally promulgated in 1231. The study of physic and lectures in that art were restrained to those two universities. Students were to apply themselves to logic for three years before they commenced the study of medicine, which they were to pursue for five years; nor were they then admitted till they had practised for one year under an expert physician. After a public examination, the University of Salerno had full power to grant a licence to practise: that of Naples could only certify the sufficiency of the candidate to the king or his chancellor, who granted the licence. The names of 'doctor' and master were not then known as specific titles of honour, but were used in their original significations for teachers or persons skilled in their art.

The licensed practitioners took an oath to observe the regulations respecting medicines, to inform the court if apothecaries did not prepare their drugs properly, and to give advice to the poor gratis. Every physician was to visit his patient at least twice a day, and once in the night if necessary, and was not to receive for his attendance more than half a golden tarenæ (a gold coin which weighed twenty grains, and would now be worth four shillings and twopence) daily; or if called out of the city, three tarenæ and his expenses, or four tarenæ to provide himself. He was not to undertake to cure a disorder for a specific sum, or to keep an apothecary's shop, or to be in partnership with an apothecary. Surgeons were to study for one year, and to be perfect in anatomy before they were admitted to practise. Apothecaries were to take an oath to compound their medicines according to the forms prescribed, and for a fixed price, which for simple drugs was three tarenæ an ounce. Such were the regulations of the emperor Frederic. The three professions appear to have been kept distinct as early as the time of Avenzoar, who was born at Seville in the 11th century, and even in the time of Celsus. (Freind, 'Historia Medicinæ,' ed. Paris, 4to, 1735, p. 253; Le Clerc, 'Hist. de la Méd.,' p. 334.) These constitutions, and the privileges of the university of Salerno, were confirmed and extended by other princes, and were in force in modern times. They are the most ancient medical statutes in Europe, and show the state of the medical professions in those early times. When fully established, the university consisted of ten doctors, of whom the eldest had the title of prior. Their common seal bore the image of St. Matthew, their patron saint, whose body had been given to them by Robert Guiscard, and the inscription of 'Civitas Hippocratica.' Students were admitted to the doctorate by the solemn form of having a book put into their hands, a ring on their fingers, a crown of laurel on their heads, and a kiss on their cheeks. (Mazza, cap. ix.; Freind, 'Hist. Med.')

The medical science of the Arabians, thus introduced into Salerno, was in substance that of the Greeks, from whom it was derived. In the theory and cure of diseases they followed the opinions of Hippocrates and Galen; not indeed in their native simplicity, but often corrupted by their own vain and fanciful inventions, by the superstitions of astrology, and the follies of alchemy. (Freind, p. 479; Gian., vol. ii., p. 119, sec. 3.) Yet it is admitted that the modern science of medicine owes much to their improvements. They greatly extended the *Materia Medica* by the introduction of many efficacious remedies. They added to the list of medical plants. The first but very gradual introduction of chemistry into medicine is wholly theirs (as all the chemistry that is to be found in Greek writers relates to the fusion or transmutation of metals), and many of their formulæ of compound medicines still retain a place in modern dispensaries. In many points of practice they ventured to differ from their masters, as in less copious bleedings, in milder purgatives, in substituting sugar for honey in their syrups; and they first gratified the eyes and

the taste of their patients by clothing their prescriptions in gold and silver leaf—a luxury which continued till within the last few years.

Under the title 'Regimen Sanitatis Salernitanum,' we possess a collection of dietetical precepts, written chiefly in Latin rhyming hexameters. The poem is dedicated, by the Medical School at Salerno, to Robert, son of William the Conqueror, who is styled king of England, and was probably composed by a physician of Salerno, at the beginning of the 11th century. Johannes de Medicano is generally supposed to be the author of it, which opinion was first started, in 1649, by Zacharias Sylvius, on account of some manuscripts (one of them as old as 1418) which had his name in the inscription; however neither the earliest commentators and editors, nor the oldest manuscripts make any mention of his name. The number of the verses varies much in different manuscripts, as the poem in the middle ages received by degrees many spurious additions. The oldest editions, with the commentary of Arnaldus de Villanova, have only three hundred and sixty-four verses, which may therefore be considered as the only genuine ones, since Arnaldus, who lived in the 14th century, and passed some time at Salerno, had certainly an opportunity of examining the most accurate copy of the poem. The whole work was much esteemed, not only in the middle ages, but also as late as the 17th century, and it is at the present time an important source of information respecting the state of medicine in that age. As it was not designed for physicians, but for an unlearned sovereign, and for general use, its object was rather the preservation of health than the cure of diseases. The means prescribed for this purpose consist in the due observation of the six non-naturals (strangely so called because they are external, and not parts of the natural body), air, food, exercise, sleep, the excretions, and the passions. To these heads may be reduced the various rules of living in a salubrious air and observing the changeable seasons; the minute detail of all kinds of meat and drink, and the qualities of herbs, which constitute the great bulk of the poem; frequent exercise and ablutions, avoiding sleep at improper times, not neglecting the calls of nature, and avoiding cares and all other violent agitations of the mind. The number of editions that have been published of this work is immense. A complete list of them is prefixed to Ackermann's edition, 8vo, Stendal, 1790; Sir Alexander Croke's, crown 8vo, Oxford, 1830; and in Choulant's 'Handbuch der Bücherkunde für die Aeltere Medicin,' 8vo, Leipzig, 1828 (from which two last works the preceding account has been principally abridged). The best commentary is that by Arnaldus de Villa Nova, which has been very frequently reprinted, and which has formed the basis of most of the editions since published. It was first published at Montpellier, 4to, 1480. Two of the most useful and valuable editions (though without the Commentary of Arnaldus) are Ackermann's and Croke's mentioned above. The work has also been translated into German, French, English, Italian, Dutch, &c.; and upon the whole no medical work appears ever to have enjoyed greater popularity.

SALES, DE, FRANCIS, SAINT, was born at the castle of Sales, near Annecy, in Savoy, on the 21st of August 1567. His parents, the Count and Countess de Sales, are described as having adorned a noble birth and elevated station by a life of the strictest piety. The early years of Francis, their eldest son, were spent in acquiring the rudiments of learning at the colleges of La Roche and Annecy. The more effectually to pursue his studies, he was, in 1578, sent to Paris, and placed under the care of the Jesuits. He soon became a proficient in rhetoric and philosophy, and at the same time he did not neglect those arts which are calculated to adorn an intercourse with society, though in doing so he appears rather to have obeyed the wishes of his father than to have followed his natural inclination. He remained in Paris till 1584, when he was sent to Padua to study civil law under Guy Panciroli. At Padua he formed an acquaintance, which afterwards increased into friendship, with the Jesuit Antonio Possevino, under whose spiritual direction he placed himself. His success at Padua exceeded the expectations of his friends, and, at the age of twenty-four, he left that university with a high reputation for learning and piety. He afterwards spent some time in Italy, and made a pilgrimage to Notre Dame of Loretto. On his return to his native country he found that his father had obtained for him from the Duke of Savoy the appointment of counsellor in the senate of Chambéry, and was desirous of uniting him with a rich heiress, whose fortune would enable him to support the title which he was to inherit. The mind of Francis, for a long time directed towards theological pursuits, had however gradually acquired a disposition which could only be satisfied by an entire devotion to them, and he was anxious to enter the Church; but accustomed from childhood to yield obedience to his father's wishes, he feared to make him acquainted with his desire. In this difficulty he consulted a relation, Louis de Sales, who was canon of the Church of Geneva, and through his mediation the Count de Sales was induced to abandon his favourite project, and allowed his son to devote himself to the ministry of the Church. After receiving the first orders he was permitted by the bishop to preach. The greatest success attended his first efforts in pulpit oratory. He possessed indeed all the qualities calculated to gain the attention of his hearers: a voice powerful and pleasing, an animated and persuasive action, an earnestness which gave evidence that he was himself deeply convinced of the truths he was advocating, were heightened in their

effect by a strikingly handsome person and a mild and modest demeanour. In the fulfilment of his pastoral duties he was not less remarkable: he united the most untiring activity in visiting his flock and in relieving the wants of the sick and poor with an unaffected solicitude and evangelical patience, and he was repaid by a most remarkable amount of esteem and affection.

We must now present him exercising these qualities in a larger sphere, and applying them to the conversion of those who differed from him in religious faith. The better to understand the peculiarly difficult nature of the mission with which he was intrusted, it will be necessary to give some account of the scene of his labours. The city of Geneva had long renounced the authority of its bishop and that of the Duke of Savoy; it was an independent republic, and the stronghold of the Calvinistic party. It had become possessed of the ancient duchy of Chablais, together with the territories of Gex, Terni, and Gaillard: coincident with these changes was a substitution among the inhabitants of the creed of Calvin for the faith of Rome. In 1590, Charles Emmanuel, duke of Savoy, had wrested from the Genoese this ancient portion of his duchy, and his first care was to attempt to bring back the inhabitants to their former religion. (De Thou, 'Hist. Univ.', l. xcix.) For this purpose he applied to the titular bishop of Geneva, Claude de Granier, to send missionaries over the conquered country. Francis de Sales, and his relation Louis, the canon of Geneva, were among the first to undertake an enterprise in the prosecution of which much opposition and some personal danger were to be apprehended.

On the 9th of September 1594 the two missionaries arrived at the frontiers of Chablais, where they dismissed their servants and equipages and determined to travel on foot, in order more nearly to conform to the example of the Apostles. The town of Tonon, the capital of the Chablais, which contained only seven Roman Catholics, was the first place in which they exercised their mission; the fruit of it may be judged of from the fact that on the Christmas-eve of 1597 eight hundred persons were admitted to the communion of the Eucharist in the church of St. Hippolytus in that town. But the most important object Francis had in view was the conversion of the leaders of the Calvinistic party. To effect it he first solicited an interview with Theodore de Beza [BEZA], who was then fast sinking under the weight of age and infirmities. Several conferences took place between them at Geneva, and the result of them is very differently related according to the religious persuasions of the narrators. If any change however took place in the mind of Beza through his intercourse with Francis, which is extremely improbable, it is certain that it was accompanied by no public profession. Michelet, without however citing his authority, remarks, that the Roman Catholic missionary added to his spiritual inducements the weight of temporal advantages, and made him an offer of a pension of 4000 crowns if he would conform to his church.

On the return of Francis to Annecy, in 1596, he was appointed coadjutor to Claude Granier, the bishop of Geneva, with the title of Bishop of Nicopolis 'in partibus infidelium'; this dignity he for a long time refused to accept, and only yielded on the earnest solicitation of the pope, Innocent IX. In 1602 he visited the court of France for the purpose of obtaining permission from the king, Henri IV., to pursue his missionary labours in the territory of Gex, which had been given up to France by a treaty of peace concluded between Henri and the Duke of Savoy. A course of Lent sermons, which he preached in the chapel of the Louvre, is said to have created considerable sensation, and to have become the means of recalling several of the most influential of the Calvinistic nobility to a belief in their ancient faith. The king, desirous of retaining him in France, made him the offer of the first bishopric which might become vacant, and the immediate enjoyment of a considerable pension. These offers however he declined, declaring that his chief wish was to be permitted to live and die among those whom Providence had intrusted to his care.

On his return to his native country, after a residence of nine months in Paris, he was, by the death of De Granier, appointed to the bishopric of Geneva. He prepared himself by a close retirement of twenty days at the castle of Sales, for his consecration to this important office. In this retirement he framed for himself a rule of life by which he was in future to be guided; the details of it are given with elaborate minuteness by his biographers. On the 8th of December 1602 he was consecrated bishop of Geneva. His first care was to introduce a uniformity of usage among the clergy of his diocese, and to reform various abuses which time had gradually introduced; these measures he chiefly effected by the issue of mandates, in which judicious advice was conveyed in the language of Christian charity. In short, he showed himself a worthy disciple of St. Charles Borromeo, whom he professed to take as his model in the discharge of his episcopal duties. [BORROMEO, ST. CHARLES.] In 1605 he devoted himself effectually to the task of reforming the monasteries in his diocese. The following year he preached during Lent at Dijon in France, where he was again successful in making several converts from Calvinism. On this occasion likewise he refused the repeated offers of advancement from the French king, while at the time he gave proof of his consistency in declining the proffered honour of a cardinal's hat from the pope, Leo XI. In 1607 he was applied to by the reigning pontiff, Paul V.,

to express his opinions on the extent of the efficacy of Divine Grace on the free will of man. It was principally on this question that the Dominicans and Jesuits were divided. His answer is expressed with so much caution that it is difficult to discover from it his real sentiments; they are however more clearly shown in his other writings, especially in his treatise on the Love of God. About this period was published his 'Introduction to a Religious Life,' a book which still maintains a merited popularity. The style, though perhaps too full of metaphor for modern taste, is devoid of affectation, and breathes throughout the genuine spirit of Christian simplicity.

In 1609, Jean Pierre Camus was named Bishop of Bellay, and he wrote to the Bishop of Geneva to request him to perform the ceremony of his consecration. Between these two remarkable men, whose habits and dispositions were very dissimilar, the closest friendship ever after subsisted. It is to Camus that we are indebted for a most interesting work, 'The Spirit of St. Francis de Sales,' which, more than any other, develops the private excellences of the saint. The following year Francis founded a religious order for females, called the Order of the Visitation, and placed it under the superintendence of a pious lady, Madame de Chantal, sister of the Archbishop of Bourges, with whom he had become acquainted on his visit to Dijon. The fervent admiration of this lady for the qualities of the Bishop of Geneva, to whom she had intrusted the guidance of her spiritual life, the letters of perhaps too impassioned piety which she so frequently addressed to him, and which may be seen in the collection published at Paris in 1660, have been malignly dwelt upon by some writers. The increasing infirmities of the Bishop of Geneva, arising from the constant application to the duties of his office, obliged him, in 1618, to seek for the assistance of a coadjutor bishop; and, at the suggestion of Cardinal Frederick Borromeo, his brother, John Francis de Sales, was consecrated to that charge with the title of Bishop of Chalcedon. In 1619 he accompanied to Paris the Cardinal de Savoy, to whom the mission had been intrusted of soliciting for the Prince of Piedmont the hand of Christina, sister of Louis XIII. On the marriage of this princess he was appointed her almoner, an office which he at first declined, and only accepted on condition that it should not be allowed to interfere with the discharge of his other duties. But the undiminished energy of such a spirit was too overpowering for so feeble a frame. In 1622 he foresaw his approaching end, and prepared himself for it by severer mortifications and a closer communion with God. He preached for the last time on the Christmas-eve of that year; the next day he was seized with a paralytic attack, under which he succumbed on the 28th of December, 1622. He was buried in the Church of the Visitation at Lyon, but his remains were afterwards transferred to Annecy. In 1665, his memory was canonised by the pope, Alexander VII., who appointed the 29th of January, the day on which his body was conveyed to Annecy, as his festival in the Roman calendar.

The claims of St. Francis de Sales as a devoted servant of the Roman Catholic Church have never been disputed, though they have been differently esteemed and represented. Humility and zeal were the two prominent virtues by which he was distinguished; the former taught him to forget himself, the latter to be ever mindful of the wants of others. Between him and Fenelon a closer comparison might perhaps be made than with any other name celebrated in the annals of sanctity. They possessed in common noble birth and a high station, with the tone and manner which these advantages are calculated to produce; the same talent in captivating the attention and winning the sympathies of those among whom they laboured; in the discharge of their pastoral duties they were alike successful, and by the use of the same means, a careful adaptation of advice to the temper and disposition of the advised. While however it must be admitted that Fenelon was superior to De Sales as a writer and a theologian, he was probably inferior to him in genuine disinterestedness and the practice of self-denial: he loved rather to labour among the rich and great than, like De Sales, to abandon the court in order to mingle with the crowd of the poor and suffering. Fenelon, it is true, performed with zeal those essential duties of a pastor when he was banished to his diocese; De Sales was continually separating himself from the court in order to perform them. [FENELON.]

The most known of his writings, which are not very numerous, have been noticed in this article; the best edition of them is that of Paris, 1641, 2 vols. folio.

His principal biographers are his nephew, Charles Augustus De Sales, Henri De Maupas, Bishop of Evreux, Le Père Goulu, Mad. De Bussy Rabutin, and the Jansenist Binet. See also Alban Butler's *Lives of the Saints*; Moreri, *Dict. Historique*; and the *Biographie Universelle*.

SALIERI, ANTONIO, a composer of great eminence in his day, was born at Legnano, in the Venetian territory, in 1750. When only fifteen years of age he lost his father, a respectable merchant, and then immediately determined to make music, which he had studied only as an accomplishment, his profession. His first master was Giovanni Pescetti, and his next Leopold Gasmann. The latter took his pupil to Vienna, where he made the acquaintance of Gluck, who, at that time declining in health, intrusted Salieri with the charge of composing 'Les Danaïdes,' which the great German master had engaged to produce for the Académie Royale de Musique. It was performed with the most

brilliant success in Paris, and not only made the reputation of the author, but added nearly 20,000 francs to his fortune. He afterwards brought out at different theatres many operas, among which his 'Tarare,' or 'Axus, Roi d'Ormus,' and 'La Grotta di Trofonio,' were the most popular, and are now best known. He died at Vienna in 1823. Salieri was a kind of rival of Mozart, and, strange to relate, his music was much preferred by the court and fashionable circles of Vienna to that of the greatest dramatic composer that then or has ever since lived.

SALIH-BEN BAHLEH (called by Abulfaraj, 'Hist. Dynast.' p. 154, SALIH-BEN NAHLEH), an eminent Indian physician, who came to Irak and practised at Baghdad in the time of Haroun-al-Rashid, who reigned from A.H. 170 to 193 (A.D. 786 to 808). "He was distinguished," says Ibn Abi Osaibiah, Oioûn Al-Amba fi Tabacât Al-Atebba ('Fontes Relationum de Classibus Medicorum,' cap. xii, sec. 7), "amongst the learned men of India, well skilled in their methods of medical treatment, and had power and influence in the promotion of science." He acquired great reputation by discovering that Ibrahim-Ben Salih, the cousin of the kalif, whom Jabril-Ben Bachtishua had pronounced to be dead, was only apparently so; of which event the same author gives a curious and circumstantial account. It appears that he first went alone into the room where Ibrahim lay, and immediately there was "heard a sound as of one striking the body with the palm of the hand." Then the kalif and some others were admitted, and, in order to prove that Ibrahim was alive, "Salih took out a needle that he had with him, and thrust it in between the nail and the flesh of the thumb of his left hand, when he immediately plucked away his hand and drew it towards his body." He then ordered that his burial clothes should be taken off him, and that he should be washed till the scent of the hanûit (the scent that is mixed for dead bodies) was removed; after which he called for some 'kundus,' and blew some of it up his nose. In about ten minutes his body began to move; then he sneezed, and sat up in his bed, supposing that he had been asleep, and complaining only that he had been bitten by a dog in the thumb, and that he still felt the pain, at the same time showing the thumb into which Salih had thrust the needle. Ibrahim lived a long time after this circumstance, and married the Princess Alabbasah, daughter of Almahadi, and obtained the government of Egypt and Palestine, and died in Egypt.

With respect to the kundus, we are told in the 'Kamus' that "it is the root of a plant which is yellow inside and black out. It operates as an emetic and a purging medicine, and clears away the ringworm. When it is reduced to powder and blown up the nose, it causes sneezing and enlightens the weary eyes, and stops blindness." See Avicenna ('Canon,' lib. ii, tract 2, cap. 187, p. 280, ed. Venet., 1564), where a description of its medical properties is given. Sprengel ('Comment. in Dioscor. de Mater. Med.,' lib. ii, cap. 192) supposes it to be the same as the Greek *σπρόδιον*, on which there is a chapter in Dioscorides ( *loco cit.*), and which he identifies with the *Saponaria officinalis*, or soapwort.

SALINAS, FRANCISCUS, a learned musical theorist, was born in 1613 at Burgos, the capital of Old Castile, of which city his father was quæstor, or treasurer. Blind from his birth, he had recourse to the study of music, an art to which his deprivation naturally led him. In this his progress was, as is usual in such cases, rapid, and he became a superior organist. While yet a boy he was instructed in Latin by a young woman famous for her knowledge of that language. His success in it led to his being entered at the University of Salamanca, where he applied most assiduously to the Greek language, as well as to philosophy. He then commenced reading the Greek authors on the science of music, with whose writings he made himself thoroughly acquainted, commenting on them in an equally learned and ingenious manner, and correcting errors not before detected, but seen and admitted on his pointing them out in his great work, 'De Musica,' &c., a treatise in seven books, published at Salamanca in 1677. The first book of this is on musical ratios; the second on musical intervals; the third is a clear description of the various ancient *genera*; and the fourth is on the diapason and octave, and on the doctrines of Pythagoras, Aristoxenus, Ptolemy, &c. The remaining three books chiefly relate to rhythm and the feet of the Greek and Roman versification.

Salinas died, according to Thuanus, in 1690. He was highly esteemed by Pope Paul IV., who created him abbot of St. Pancratio, in the kingdom of Naples. A full and clear analysis of his work is given by Sir John Hawkins ('History of Music,' iii. 123), to which Dr. Burney has made some interesting additions in the third volume (p. 290) of his 'History.'

SALLUSTIUS, or SAL'USTIUS, with his full name CAIUS SALLUSTIUS CRISPUS, was born in B.C. 86, in the seventh consulship of Marius, at Amiternum, a town in the country of the Sabines, near the sources of the Aternus. He was of a plebeian family; but his parents seem to have been in affluent circumstances. He received instruction from the grammarian Attius Philologus, who is said to have supplied him with an epitome of Roman history, from which he might choose subjects for his own composition. (Suet., 'De Ill. Gramm.,' c. 10.) The year in which he obtained the quæstorship is not known, but he was tribune of the plebs in B.C. 52, in which year Clodius was killed by Milo.

Sallust was a strong opponent of the aristocratical party, and accordingly in his tribuneship took an active part in the proceedings

instituted against Milo. (Asconius, in 'Cicero. Milon.,' pp. 38, 45, 49, 50, 51, ed. Orelli.) In B.C. 50, he was expelled from the senate by the censors Appius Claudius and Piso (Dion, xl. 63); in consequence, it is said, of his immoral life; but there is no good authority for this statement of the grounds of his expulsion, while we know that Appius Claudius belonged to the Pompeian party, and that Sallust only shared the general fate of all Cæsar's friends. After his expulsion from the senate, Sallust seems to have repaired to Cæsar's camp in Gaul, and to have accompanied him in his invasion of Italy. According to some accounts he was made quæstor again after the battle of Pharsalia (B.C. 48); but we know for certain that he was prætor in the following year (B.C. 47), and was present at the mutiny of Cæsar's troops in Campania, on which occasion he narrowly escaped with his life. (Dion. xlii. 52.) He accompanied Cæsar the same year into Africa, where he was actively employed in the war (Hirt., 'De Bell. Afric.,' c. 8, 34), and when Cæsar quitted Africa in the following year (B.C. 46), he left Sallust governor of the province (Hirt., Ibid., c. 97), where, according to Dion Cassius (xliii. 9), he acquired immense wealth by the plunder of the country. On his return home, Sallust built the famous palace at Rome, which was afterwards used by the emperors, and was not destroyed till the time of Alaric. About this time he is said to have married Terentia, the divorced wife of Cicero. He died, B.C. 34, four years before the battle of Actium.

The moral character of Sallust has been drawn in the darkest colours by many writers. He has been accused of the most unbounded profligacy, which has been represented as the more inexcusable on account of the praises he has bestowed in his works upon virtue and temperance. These accusations however do not rest upon any sufficient authority, unless we except the tale told by Varro, that Sallust was detected in adultery with Milo's wife, and severely punished by the husband (Aul. Gell., xvii. 18), to which circumstance the words of Horace ('Sat.,' i. 2, 41), "ille flagellis ad mortem cæsis," refer, according to one of the ancient scholiasts.

Sallust was a strong party-man. He thoroughly despised and hated the aristocratical party, and took no pains to conceal his opinion. He had designated Pompey, the leader of the aristocracy, as a man "oris improbi, animo inverecundo," and accordingly it was only to be expected that his own character should be attacked and traduced in every possible manner. Leneus, the freedman of Pompey, wrote a work expressly against Sallust (Suet., 'De Ill. Gramm.,' 15); and a rhetorician under the early emperors, when it had become the fashion to praise the old Pompeian party, wrote a declamation against the character of Sallust, which is still extant, and falsely ascribed to Cicero. That Sallust was not better than his contemporaries may easily be believed, and there seems no reason for doubting the statement of Dion Cassius, that he followed the example of his contemporaries in plundering the province of which he was governor.

Sallust wrote a history of Catiline's conspiracy, and of the war with Jugurtha, and also a general history of Roman affairs from the death of Sulla (B.C. 78) to the appointment of Pompey to the command of the Mithridatic war (B.C. 67). The two first works have come down to us entire; but of the latter we have only fragments; and its loss is the more to be regretted as it contained an account of one of the most important periods of Roman history, respecting which our information is very meagre and unsatisfactory. It was written in five or six books, addressed to Lucullus, and appears to have contained an introduction in which an account was given of the civil wars between Sulla and Marius. It connected his histories of the Jugurthine war and the Catilinarian conspiracy. The only fragments of it of any length are four orations and two letters, which are characterised by Sallust's usual style.

The merits of Sallust, both as an historian and a philosopher, have been rated very low by many modern critics. The objections which have been made to the moral reflections and dissertations in Sallust's writings as unsuitable to the nature of historical compositions, have arisen from a want of due attention to the object which the historian had in view. This does not appear to have been so much the narration of the particular events which he chose as the subjects of his history, as the elucidation of certain great political facts. In his 'Jugurtha,' his object was to show the venality and total want of principle in the aristocratical party, and how both their private and public profligacy at length deprived them of the power which they had possessed since the time of the Gracchi. In his 'Catiline' he had the same object to a certain extent in view, though here it was not to show how the vices of the aristocratical party occasioned their loss of power, but rather to describe the consequences to which those vices had at length led; for it must be remembered that Catiline and his associates had been brought up in the school of Sulla, and belonged to the aristocracy.

In estimating the value of Sallust's writings, it should also be borne in mind that the Romans possessed no works worthy of the name of histories before his time. Preceding writers merely narrated events according to the order of the years in which they happened, without any attempt to trace the causes and results of the events which they recorded. Sallust studiously avoided the annalistic style of his predecessors, and appears to have made Thucydides his model, to whom he is sometimes compared by the ancients themselves. The fastidious critics of the Augustan age objected to the use of the antiquated words and expressions which Sallust sometimes employed (Suet., 'De

III. Gramm.,' 10), but it is no small proof of the excellence of Sallust's style that Tacitus closely imitated it.

Besides the works already mentioned, two epistles have come down to us under the name of Sallust, addressed to Julius Caesar, on the management of the state ('De Republica Ordinanda'); but these are evidently not the work of Sallust, and are supposed by Niebuhr to have been written, at the latest, in the second century of the Christian era. ('Römische Geschichte,' vol. iii., p. 401.) There is also extant a declamation against Cicero, falsely ascribed to Sallust.

The first edition of Sallust was published at Venice, in 1470. The edition of Curtius, which was published at Leipzig, 4to, in 1724, with a valuable commentary, has formed the basis of most of the subsequent editions. The best modern editions are those of Kritz, 2 vols. 8vo, Leipzig, 1823-1834, which does not however contain the fragments, and of Gerlach, Basel, 3 vols. 4to, 1823-1831. An accurate edition of the text, with the principal various readings, but without explanatory notes, was published by Orellius, Zürich, 12mo, 1840. The principal translations of Sallust into the European languages are, in English, by Gordon, Lond., 4to, 1769; by Rose, 8vo, 1757; and by Sir Henry Stewart, 2 vols. 4to, in French, by De Brosses; in Spanish, by Gabriel de Bourbon, the son of the king of Spain, Madrid, 4to, 1772; in Italian, by Alfieri; and in German, by Gerlach, Prenzlau, 1827.

SALLUSTIUS, a Platonic philosopher, who lived in the fourth century of the Christian era. He wrote a work in Greek, 'On the Gods and the World,' which was originally published by Leo Allatius, 12mo, Rome, 1638. The best edition of this work is by Orelli, 8vo, Zürich, 1821. It has been translated into French by Formey, 8vo, Berlin, 1748, and into German, by Schulthess, 8vo, Zürich, 1779.

SALMASIUS, CLAUDIUS, the Latinised form of his real name CLAUDE DE SAUMAISE, was born near Sémur in Auxois, in the year 1588 or 1596, more probably the latter. His father, who was a member of the parliament of Burgundy, was a person of considerable learning; he translated the work of Dionysius of Alexandria into French verse, 12mo, Paris, 1597. Young Salmasius was educated at home by his father, and is said to have made such astonishing progress in his studies as to be able to read Pindar at ten years of age, and to write Greek and Latin verses with fluency and correctness. At the age of sixteen he was sent to Paris to prosecute his studies, where he became acquainted with Casaubon, by whose influence he was induced, contrary to the wish of his father, to embrace the Reformed faith. From Paris he went to Heidelberg, where he made a formal renunciation of the Roman Catholic religion, in which he had been educated. At Heidelberg he obtained the friendship of the jurist Denys Godefroy and of Gruter, who appreciated his talents, and recommended him to the notice of all the great literary men in Germany. During his stay in this city, he prosecuted his studies with the greatest perseverance, and perused not only the Greek and Latin writers which were then published, but also numerous others, which existed in manuscript in the university library. He devoted the whole of every third night entirely to study, till at length his excessive application occasioned a long and serious attack of illness. About this time (1608) his first publication appeared, which was an edition of a treatise in Greek by Nilus, archbishop of Thessalonica, on the primacy of the pope, and also of another work on the same subject, by a monk of the name of Barlaam, both of which were accompanied with a Latin version and a few notes. He published soon afterwards an edition of Florus, 8vo, Paris, 1609, which he dedicated to Gruter. After spending three years in Germany, he returned to France, and shortly after his return published a short treatise 'De Suburbicariis Regionibus et Ecclesiis,' in opposition to Sirmondus. In 1620 he published his edition of the 'Historiæ Augustæ Scriptores Sex,' folio, which Casaubon, shortly before his death, had intended to edit as a sequel to his edition of Suetonius. The commentary of Salmasius on these writers is full of valuable information, and may still be consulted with profit. In 1622 Salmasius published his edition of Tertullian's work 'De Pallio,' with a commentary, in which he treats at great length of the different garments worn by the ancients.

In the following year (1623) Salmasius married the daughter of Mercier, who was a person of elevated rank, and is frequently mentioned by his son-in-law in terms of the highest praise both for his learning and talents. From the time of his marriage Salmasius resided for many years in the neighbourhood of Paris, chiefly engaged in the preparation of his great work, which was published at Paris in 1629, folio, 2 vols., under the title of 'Pliniana Exercitationes in Caii Julii Solini Polyhistora,' and reprinted at Leyden in 1689, with an appendix entitled 'De Homonymis Hylæ Iatricæ Exercitationes, necnon de Manna et Saccharo.' The treatise of Solinus [SOLINUS] was evidently selected by Salmasius on account of its treating of so many various subjects in antiquity, and thus enabling him to discuss without the trouble of systematic arrangement almost any subject which he chose. It is a work of astonishing erudition; not only does it embrace questions connected with Greek and Roman history, geography, and archaeology, but it also treats at great length of the plants, herbs, and minerals known to the ancients. In order to qualify himself more completely for the work, Salmasius studied the Hebrew, Persian, and Arabic languages, with which he shows an extensive acquaintance. The work is however written in a very confused manner, and embraces too many subjects to be thoroughly treated of by one man. In this,

as well as in most of his other writings, Salmasius frequently shows great carelessness in the statement of facts, combined with much arrogance and pretension.

Upon the publication of this work the reputation of Salmasius reached its greatest height. He was solicited by various princes and states to settle in their dominions. He was invited by the Venetians, by the university of Oxford, and even by the pope; but he declined all these invitations, and at length settled at Leyden in 1632, where he received a public salary, but did not discharge any duties as professor.

Upon the death of his father in 1640, Salmasius returned to France to settle his father's affairs; and while there Richelieu pressed him to remain in his native country, and also offered him a very large pension if he would write his Life. After the death of Richelieu, Mazarin renewed the offers of Richelieu, but Salmasius resisted all their solicitations, and returned to Leyden, where he remained till 1650, when he went to Sweden to pay a visit to Queen Christina, who had written him the most pressing invitation, and had said she could not live happy without him. The climate of Sweden however did not agree with him, and he accordingly returned in the following year.

After the death of Charles I. of England, Salmasius was employed by Charles II., who was then in Holland, to write a defence of his father and of monarchy, and which he accordingly did, and published under the title of 'Defensio Regia pro Carolo I.,' 1649; to which Milton made a most powerful reply in his 'Defensio pro Populo Anglicano.' [MILTON.] Salmasius prepared a reply to Milton, but did not live to finish it. He died in September 1653.

In addition to the works which have been mentioned in the course of this article, Salmasius also wrote and edited the following works: 'De Usuris,' 8vo, Leyden, 1638; 'De Modo Usurarum,' 8vo, Leyden, 1639; 'Dissertatio de Fomere Trapezitico, in tres libros divisa,' Leyden, 1640; 'Notæ in Pervigilium Veneris,' 12mo, Leyden, 1638; 'Commentarius in Simplicii Enchiridion Epicteti,' 4to, Leyden, 1640; 'Interpretatio Hippocratei Aphorismi de Cunctis,' 8vo, Leyden, 1640; 'De Hellenistica Commentarius Controversiam de Lingua Hellenistica decedens, et plenissime pertractans Origines et Dialectos Græcæ Linguae,' 8vo, Leyden, 1645; 'Observationes in Jus Atticum et Romanum,' 8vo, Leyden, 1645. A collection of Salmasius's Letters was published by Antony Clement after his death, to which his Life is prefixed, Leyden, 1656.

SALMON, NATHANIEL, the son of the Rev. Thomas Salmon, was admitted of Corpus Christi College, Cambridge, in 1690. He entered into holy orders, and obtained a curacy in Hertfordshire, but abandoned the clerical profession for that of medicine, in the practice of which, and in the study of antiquities, he passed the remainder of his life. He died on the 2nd of April 1742. His principal works are: 'A Survey of the Roman Stations in Britain according to the Roman Itinerary,' 8vo, 1721; 'A Survey of the Roman Stations in the Midland Counties in England,' 8vo, 1726; 'History of Hertfordshire,' London, fol., 1728; 'Antiquities of Surrey,' London, 8vo, 1736; 'History and Antiquities of Essex, from the collections of Mr. Strange-man,' London, fol., 1740.

SALOMON, JOHANN-PETER, a composer of merit, a violinist of the highest rank, and an active and enterprising promoter of music, was born at Bonn, in 1745. He was educated for the profession of the civil law; but was eventually allowed to indulge his inclination for music, and soon became celebrated not only for his performance on the violin, but for his knowledge of the harmonic art in all its branches.

When young he entered the service of Prince Henry of Prussia, at Berlin, who became much attached to his youthful musician. For this accomplished and amiable prince he composed several French operas. He afterwards accepted an invitation to Paris, in 1781, where he met with an abundance of praise, but speedily sought the English shores, in hope of obtaining more solid reward, and was not disappointed. Arriving in London, he was immediately introduced to the more eminent amateurs, among whom were many of the nobility, and his cheerful disposition, superior manners, and good sense soon obtained for him the friendship of those who at first patronised him on account of his professional talents. In 1790 he formed the project of giving a series of subscription-concerts, and carried it into effect, in the most spirited manner, the following year. These constitute an epoch in musical history, for they led to the production of the twelve grand symphonies by Haydn, known everywhere as "composed for Salomon's Concerts"—works of an imperishable nature, because founded on immutable principles, and embodying all that is beautiful in the class of art to which they belong. A further account of these, and of the concerts, will be found in our biographical sketch of HAYDN.

In 1793 the oratorio of 'The Creation' was produced at the Opera concert-room, at the risk and under the direction of Mr. Salomon. In 1801 he, in conjunction with Dr. Arnold and Madame Mara, opened the Haymarket theatre, during Lent, with oratorios; and in the same year gave five subscription-concerts. As a professional man he now retired from public life, and chiefly occupied his time in attending at Carlton House, in composing two sets of canzonets, some songs, glees, &c., and in publishing these, together with six violin solos and two grand violin concertos, arranged for the pianoforte. But at the formation of the Philharmonic Society, in 1813, he contributed his services as a

dilettante, and led the first concert "with a zeal and ability that age had in no degree impaired." He died in 1816, and his remains were deposited in the great cloister of Westminster Abbey.

SALVANDY, NARCISSE-ACHILLE, COUNT DE, was born at Condom, in the department of Gers, June 11, 1795, but was sent to Paris in early youth, and educated at the Lycée Napoleon. He enlisted as a volunteer in 1812, and served with so much distinction during the campaigns of 1813-14, that on the 6th of April 1814, the emperor bestowed upon him, with his own hands, the decoration of the Legion of Honour.

After the restoration of the Bourbons, in 1814, M. de Salvandy was made an officer of the royal household, and in March 1815, attended Louis XVIII. to the frontiers. About this time, in his twentieth year, he began that long series of argumentative pamphlets, for which he afterwards became so celebrated, by the publication of two brochures, one called 'Mémoire sur les Griets et les Vœux de la France,' the other 'Observations sur le Champ de Mai.' In 1816 he brought out 'la Coalition et la France,' in which he displayed considerable talent. It produced a great sensation in more than one court.

In 1819, he became a member of the conseil d'état, holding the office of Maître des Requêtes. But he was incapable of submission to any control. The measure presented by M. Barthélemy, on the 'Loi des Electeurs,' appeared to him an organic change unfavourable to the constitution, he therefore published his 'Vues Politiques,' in which, regardless of place and emoluments, he fully described the nature of political parties, their power, influence, and objects. This act of independence was followed by several others, as the restored family seemed to advance in their system of aggression upon public liberty, until the startling pamphlet 'Sur les Dangers de la Situation présente,' produced a rupture between him and the ministry.

In 1824, M. de Salvandy went to Spain, and shortly afterwards married Mademoiselle Oberkamp. The result of this journey was a work of more than usual length, 'Don Alonzo, ou L'Espagne,' comprising a full account of the Peninsula, and its various political changes. It was in the course of the same year, 1824, that he began to write his well-known articles in the 'Journal des Débats,' the most conspicuous of which at that period were entitled 'Les Funérailles de Louis XVIII.' and 'Le Nouveau Règne et l'ancien Ministère,' recommending a course of constitutional policy to Charles X. Like Châteaubriand, Armand Carrel, and other independent political writers, he steers a middle course between the opposite parties, and flatters neither of them. Ever constant to his principles, and equally averse to arbitrary rule and anarchical divisions, he maintained for forty-two years the same moderate opinions of equity and justice. In all his writings he took for his basis, the maxim—there is no security for France but in constitutional monarchy. His style is energetic, and his arguments are expressed in warm language; yet he never abandons the fundamental principle; notwithstanding the strong measures adopted by the French government to embarrass him, especially by the revival of the 'censure.'

In 1827, during the short liberal ministry of M. de Martignac, M. de Salvandy was created Conseiller d'Etat, on which occasion Charles X. said to him: "you must admit that you have sometimes gone a little too far." But when the Polignac cabinet was formed, in 1829, he resigned immediately.

From 1830 to 1848, during the whole reign of Louis Philippe, M. de Salvandy continued to publish his separate pamphlets, and his articles in the 'Journal des Débats.' Amongst these few have been more admired than his 'Seize mois; ou la Révolution de 1830 et les Révolutionnaires.' M. de Salvandy became a député in 1832, when he observed the same course of moderate and liberal policy as in his writings. He was more than once called to fill some of the highest ministerial offices of state, during the reign of the Citizen King. He likewise became a member of the French academy, and was created a count. After the coup d'état, in December 1851, he withdrew, like most of his eminent fellow-countrymen, into comparative retirement. He died December 15, 1856, at the age of sixty-one.

SALVATOR ROSA. [ROSA, SALVATOR.]

SALVIATI, IL (FRANCESCO ROSSI), so called from having been patronised and protected by the Cardinal Salviati, was the son of Michel Angiolo Rossi, and was born at Florence in 1510. He studied painting first under Andrea del Sarto, and afterwards under Baccio Bandinelli, and was fellow-student with Giorgio Vasari, between whom and himself there existed a strict intimacy. They studied together at Rome, and although the superior genius of Salviati prompted him to a higher class of design than that to which Vasari attained, the latter, with a remarkable freedom from jealousy, always in his writings celebrated the eminence of his friend. Indeed in his 'Le Vite di più eccellenti Pittori,' he speaks of the work of his fellow-pupil and countryman in the Palazzo Grimaldi at Venice, representing the history of Psyche, as the finest work in Venice. Whilst at Rome Salviati painted the 'Annunciation' and 'Christ appearing to St. Peter' in the church of La Pace, and he embellished the vault of the chapel of his patron the cardinal with a series of frescoes representing the life of St. John the Baptist; he painted for the Prince Farnese a set of cartoons for the tapestry of his palace, displaying the principal events of the history of Alexander the Great, and, in conjunction with Vasari, he ornamented the Cancellaria with several fresco works.

From Rome he went to Venice, and thence to Mantua and Florence; and in the latter city was employed by the grand duke to decorate one of the saloons of the Palazzo Vecchio, where he painted the 'Victory and Triumph of Furius Camillus.' He did not long remain at Florence, but upon the invitation of the Cardinal de Lorraine visited France, where he painted for Francis I. some part of the château of Fontainebleau. In Paris he executed a fine work for the church of the Celestines, representing the 'Taking down from the Cross;' but not feeling satisfied with his situation in the dominions of Francis, he returned to Rome, where he died, in the year 1563.

The violence and turbulence of Salviati's disposition caused him to be frequently embroiled in quarrels, and his envious and illiberal disposition towards the merits of his brother artists provoked from them a very unfair comparison of his works with those of others. Though received in France by Primaticcio, the superintendent of the works at Fontainebleau, with respect and kindness, he acted towards that person with ingratitude; and when he returned to Rome he fell into virulent disputes with Daniello di Volterra, Pietro Legorio, and others; and carried his violence to such excess that it is said to have brought on a fever, which proved fatal to him. In invention Salviati was rich and fertile; in composition, original and copious; and though inferior in his general colouring, his carnations are delicate and tender. He showed great skill in the management of his draperies and architectural accessories.

SAMANIANS, a Persian dynasty under the kalifa, of which the founder, Ismael, was the first who had the title of Padishah (king). As the Mohammedan possessions increased in extent, the governors of the provinces gradually usurped a more extended and less dependent power, sometimes refusing to their spiritual and temporal superior the nominal allegiance which at others they were content to pay. Amru Laith, a governor of this class, ruled Khorasan, Fars, and Irak, and his extent of dominion raised the jealousy of the kalif Motadhedh, who stirred up against him Ismael Samani, a chief who had been for some time rising into a power, of which the first foundation had been laid by his grandfather Saman. Ismael passed the Oxus into the states of his rival, and prepared to dispute his possessions by arms; but the contest was decided in a more unusual manner. The horse of Amru took the bit in his teeth and carried his rider into the camp of the enemy. His soldiers, left without a commander, fled, and thus a large portion of Persia was added to the dominions of the fortunate conqueror. It is said that Ismael sent an officer to console and comfort his prisoner; a kindness which Amru returned by sending to his captor a list of the places where he had stored his treasures. Ismael however refused even to look at this; treating the offer as an attempt to throw upon him the guilt incurred in the unjust accumulation of these treasures. The ultimate cause of their discovery, say the historians of this dynasty, was as singular as any part of this extraordinary correspondence. The ruby necklace of one of the wives of Ismael was carried off by a bird of prey, who took it for a piece of flesh. Pursued by soldiers with shouts and clashing of arms, he dropped the splendid booty into a well, and in this well were found, after a diligent search, the treasure in question. Ismael was recognised as king by Motadhedh in 287 of the Hejira (A.D. 900), and reigned seven years. His descendants who held this kingdom from father to son, except in the last two instances, in which it passed from one brother to another, were Ahmed, Nasser, Noah I., Abdalmelek I., Mansor I., Noah II., Mansor II., and Abdalmelek II. The dynasty was superseded by Mahmoud of Ghizni, who incorporated their dominions with his own empire, after they had held the greater part of Persia for more than a hundred years.

SAMSÖE, OLE JOHAN, was born on the 2nd of March 1759, at Nestved, where his father was a person in easy circumstances. At first he was educated at home by a private tutor, but was afterwards sent to the school at Colding, of which Justitsraad Thorlacius was then the rector. He proceeded thence to the University of Copenhagen, where he distinguished himself by his superior abilities and attainments, and where he formed some literary friendships. One of his most intimate associates was Rahbek, with whom he set out on a tour through Germany in the summer of 1782. The two friends visited Paris on their return in the autumn of 1784. It was now necessary that he should form some decisive plans for the future, for though his father had left him what was at the time a considerable property, it was vested in Indian stock, which had fallen very greatly in the interim, while the expenses of travelling, of which he seems to have borne the greater share, had made some inroad into his finances. At the advice therefore of a friend, he applied for the post of teacher to the royal pages, but did not hold it longer than about five years. His salary however was continued to him as a pension.

In 1793 he was made one of the masters of the Latin school, but resigned that situation in the following spring, his motive for accepting it having been chiefly to make such addition to his income as would enable him to marry a lady to whom he was attached; yet though all preparations had been made, and the day itself fixed, the marriage was broken off by mutual consent, and without breach of good understanding between the parties. Thus released from the duty of providing for a family, Samsöe gave up his other engagements, and applied himself entirely to literary studies. Besides his Scandinavian tales, the first of which, 'Frithiof,' had been composed by him while at the university, he commenced a translation of Cicero's 'Offices,' and another

of Garve's work on morals. His proficiency in Greek literature, and his admiration of Plutarch, suggested to him the idea of writing a work on ancient history, thrown chiefly into the form of biographies of the most conspicuous personages, connected by succinct narratives of intermediate events. Unfortunately he did not execute or even begin it, for nothing of the kind was discovered among his manuscripts. He now tried his talent in a different walk of literature, where success brings with it more sudden and more brilliant popularity. The enthusiasm with which his tragedy of 'Dyvecke' (founded on the history of the beautiful mistress of Christian II. and her ambitious mother) was received, would doubtless have led him at once to prosecute that career, and indeed the plans of two other dramas on national subjects were found among his papers. But he did not live even to be assured of his triumph, as he died January 24th, 1796, just a week before the first representation of his piece, which took place on the day of his funeral. 'Dyvecke' makes an epoch in the annals of the Danish stage: written in prose, and divested of those pompous conventionalities which often serve merely to disguise feebleness, this drama captivates by the intrinsic interest of dialogues and situations, and by its forcible pathos. It is true that criticism has alleged many defects against it; yet if not perfect, it furnished a model which did not previously exist in the language; and both on that account, and as being the only dramatic attempt of the author, it deserves to be estimated by its beauties and its merits. This tragedy and his Tales form the two volumes of his posthumous pieces, edited by his friend Rahbek.

SAMUEL, the prophet and judge of Israel, was the son of Elkanah by Hannah, his wife, and was born in B.C. 1171. He had been granted to his mother's earnest prayers, she having been long barren, and she had vowed to devote him to the service of the Lord. He was accordingly brought up in the tabernacle, and when only twelve years old was made the messenger of the Lord to announce the punishment on Eli and his sons, because they were "vile, and he restrained them not." At the end of ten years the punishment was inflicted. In a battle with the Philistines the Israelites were defeated, the ark was taken, Eli's two sons were slain, and he, on hearing the news, fell backward from his seat and broke his neck. The ark which the Philistines had captured proved to them a source of calamity, and they were soon glad to restore it; but the Hebrews continued in subjection to the Philistines for twenty years. During this time the influence of Samuel increased, and on condition of the people abandoning idolatry he promised them deliverance; assembled them at Mizpah, where he was created judge; and soon after totally defeated the Philistines, who were compelled to restore all their conquests from the Israelites. His administration alone lasted twelve years, when the ill-conduct of his sons to whom he had intrusted subordinate governments, his advancing years, and the unsettled state of the country, induced the elders to resort to him at Ramah to demand that a king should be set over them. Samuel forcibly represented the evils to which they would be exposed under the rule of a despotic sovereign, but they persisted, and the first election of a king was appointed to take place in 1110. Saul, in conformity to a revelation, was anointed by Samuel; and when the tribes met at Gilgal he was chosen king by acclamation, though Samuel continued judge and priest for the remaining thirty-eight years of his life. On the occasion of the confirmation of Saul as king, after the defeat of the Ammonites, Samuel appealed to the people whether he had ever oppressed or defrauded any, and they replied that he had not. He then exhorted them to obedience, adding, "I will teach you the good and the right way." Saul however seems to have been desirous of superseding him. In prospect of a battle with the Philistines he took upon himself to offer sacrifice, for which he was rephended by Samuel. Again, when Saul was ordered to destroy the Amalekites, he spared the king, and preserved the booty; but Samuel caused the king to be put to death, and foretold that for his disobedience the kingdom would be rent from Saul. After a time, though Samuel lamented for Saul, he was commanded to anoint David [DAVID], which he did; and two years before the death of Saul he died, B.C. 1072, aged ninety, having governed Israel fifty years, twelve years alone and thirty-eight in conjunction with Saul.

Of the two canonical books of the Old Testament which bear his name, the first containing the history of Israel from the birth of the Prophet Samuel to the death of Saul (B.C. 1171-1055), and the second the history of David's reign for about forty years (B.C. 1055-1017), the Jews and most Christian writers ascribe a portion to Samuel (who, from the nature of their contents, could not have written the whole), and the remainder to the prophets Gad and Nathan, chiefly on the ground of the following passage in 1 Chron. xxix. 29:—"Now the acts of David the king, first and last, behold, they are written in the book of Samuel the seer, and in the book of Nathan the prophet, and in the book of Gad the seer." The first twenty-four chapters of the first book of Samuel, from Samuel's birth nearly to his death, are ascribed to Samuel himself. As to the remainder, it cannot be exactly determined what part was written by Gad, and what part by Nathan; but it is conjectured that Gad, who was very probably a pupil of Samuel, and a companion of David in his wanderings during the life of Saul (1 Sam. xxii. 5), wrote the history of David, from the death of Samuel to his being made king in Hebron (1 Sam. xxv.; 2 Sam. v.); and that the remaining part of the second book was written by Nathan.

These three portions then were collected by Ezra when he formed the canon into one book, for in the Jewish canon the two books of Samuel form only one. Jahn, on the contrary, ascribes the books of Samuel and of Kings to the same author, and places their publication about the forty-fourth year of the Babylonish captivity. In the Septuagint these books are called the first and second books of Kings, or of the Kingdoms.

SANADON, NOËL-ETIENNE, was born at Rouen, February 16, 1676. Having entered early into the order of Jesuits, he became professor of rhetoric first at Caen, and afterwards at Paris. On the death of Père Ducerceau, he was appointed tutor to the Prince de Conti, through whose influence he became, in 1728, librarian of the Collège de Louis le Grand, which situation he held till his death, October 22, 1733.

The Père Sanadon was possessed of considerable erudition, and was on terms of intimacy with Huet and most of the other learned men of his time. He is the author of a prose translation of Horace, 'Les Poésies d'Horace, disposées suivant l'Ordre chronologique, et traduites en Français, avec des Remarques et des Dissertations critiques,' 2 vols. 4to, Paris and Amsterdam, 1728. There is a subsequent edition in 3 vols. 12mo, 1759. This translation is better than that of Dacier, and has smoothed the way for following translators, but it possesses few of the beauties of Horace. Sanadon is the author of a Latin heroic poem, 'Nicanor Moriens,' which contains some pleasing imitations of Theocritus, Anacreon, and other Greek poets. He wrote also some Latin lyric poems, 'Carminum Libri Quatuor,' 12mo, Paris, 1715, and translated the 'Pervigilium Veneris,' 12mo, Paris, 1728. Many of his Latin verses and Latin discourses have been published separately, of which a detail is given in Moreri's 'Dictionnaire Historique,' edition of 1759.

SANCHEZ DE ARE/VALO, RODRIGO, generally known as Rodericus Sanctius, a Spanish prelate, much admired for his writings on ecclesiastical history and other subjects, was born at Santa Maria de Nieva, in the diocese of Segovia, in 1404. After receiving his classical education at the university of Salamanca, and obtaining the degree of doctor, he entered the church, and was made successively archdeacon of Treviño in the diocese of Burgos, dean of Leon, and dean of Seville. About 1440, John II., king of Castile, wishing to send an ambassador to Frederic III., chose Sanchez for that purpose. Sanchez succeeded so well in the object of his mission, that when Calixtus III. became pope, he was sent by Henry IV. of Castile to congratulate his holiness on his accession. In all his embassies Sanchez made Latin harangues to the different princes to whom he was sent. These harangues are still preserved in manuscript in the Vatican library. On the accession of Paul II., Sanchez, who had been prevailed upon by his predecessor to settle at Rome, was appointed by that pope governor of the castle of St. Angelo, and keeper of the jewels and treasures of the Roman church; and in course of time promoted to the bishoprics of Zamora, Calahorra, and Palencia, which he however governed without quitting Rome. He employed all the time he could spare from his official duties in composing several works, most of which have never been printed. He died at Rome, October 4th 1470, and was interred in the church of Santiago dei Spagnuoli. He wrote the following works:—"Speculum Vitæ Humanæ, &c.," being a treatise on morals, divided into two books, in which very heavy censure is passed on the clergy, folio, Rome, 1468; 'Epistola de Expugnacione Nigropontis,' folio, without date, but probably before the author's death. 'Compendiosa Historia Hispanica' (4to, Rome, 1470), dedicated to Henry IV. of Castile; this was subsequently reprinted in the collection entitled 'Hispania Illustrata,' by Andrea Schott, vol. i. (Frankfurt, 1603). 'Liber de Origine ac Differentia Principatus, &c.,' being a treatise wherein the author labours to prove the supremacy of the pope over all other sovereigns, Rome, 1521. He also wrote many more works on different subjects, which are still in manuscript in the Vatican library, and the catalogue of which may be seen in Nicolas Antonio, 'Bib.' vol. i., p. 297.

SANCHEZ, FRANCISCO, commonly called 'El Brocense,' an eminent classical scholar, was born at Las Brocas, in the province of Extremadura in Spain, in 1523. He commenced his studies at the university of Valladolid, where he took his degree of bachelor of arts in 1551. From thence he went to Salamanca, where, having been incorporated in the university, he obtained, in 1554, the chair of rhetoric, and also taught Greek and Latin with the highest reputation. Justus Lipsius, Scioppius, and other learned scholars of his time speak in the highest terms of him. The former bestows on him the epithets 'divine' and 'admirable,' and in one of his letters ('Ad Italos et Hispanos,' p. 89) calls him 'Mercurius atque Apollo Hispanie.' In 1574 Sanchez took the doctor's degree. He had already edited Persius, Pomponius Mela, the 'Ibis' of Ovidius, Virgil's 'Bucolics,' and Horace's 'Art of Poetry.' He now devoted all his leisure to the composition of the work which gained him most reputation, namely, his 'Minerva; seu de Causis Linguae Latinae Commentarius,' which appeared for the first time at Salamanca in 8vo, 1587, and was often reprinted during the 16th century, and in more modern times at Amsterdam, 8vo, 1754, 1761, with remarks by Scioppius and numerous annotations by James Voorbroek. [PERIZONIUS.] Another edition was published at Utrecht, 1795, with the additions of Everard Scheid. The 'Minerva' is a work in which the rules of Latin syntax are

explained by means of quotations from the classic authors. It gained its author great reputation among the learned of his time. In 1593 Sanchez resigned the chair of rhetoric in favour of his son-in-law Bartholomé de Cespedes, and reserved for himself those of Latin and Greek grammar, which he filled till the time of his death. Sanchez died on the 17th of January 1601, at the age of seventy-seven, and was buried in the church of the convent of San Francisco. Besides the above-mentioned he wrote the following works:—*Veræ brevisque Grammaticæ Latine Institutiones*, 8vo, Salamanca, 1587, which he subsequently published in Spanish under the title *Arte para saber Latin*, 8vo, Salam., 1595; *Grammaticæ Græcæ Compendium*, 8vo, Salam., 1592, Antw., 1581; *De Arte Dicendi*, Salam., 1556; *De Interpretandis Auctoribus, sive de Exercitatione*, Antw., 1582 and 1592; *Paradoxa*, 8vo, Antw., 1582; *Organum Dialecticum et Rhetoricum*, 8vo, Salam., 1588; *De Nonnullis Porphyrii aliorumque in Dialectica Erroribus Scholæ Dialecticæ*, Salam., 1588 and 1597. He also published a very learned Commentary on the 'Emblems' of Andrea Alciati, Leyden, 1563; on the 'Sylvæ' of Angelo Politiano, Salam., 1554; on the Poems of Juan de Mena [MENA]; on the works of Garcilaso de la Vega, Salam., 1574. All his minor works, with the exception of the 'Minerva,' were collected and published at Geneva in 4 vols. 8vo, 1766; prefixed to the first volume is the life of the author by Gregorio Mayans.

SANCHEZ, FRANCISCO, an eminent physician, who lived at the same time as the subject of the preceding article, has often been mistaken for him. He was born of Jewish parents, but embraced the Christian religion. He died in 1632. His works, among which is a valuable Commentary on the Physics of Aristotle, were published after his death, Toulouse, 4to, 1636.

SANCHEZ, THOMAS, a learned theologian, was born at Cordova in 1550, of noble parents. At the age of sixteen he entered the Society of the Jesuits, and in course of time became director of the novitiate at Granada. His reputation for sanctity and theological learning was such that he was consulted on difficult cases of conscience by persons from all parts of Spain and Italy. This induced him to write his *Disputationes de Sancto Matrimonii Sacramento*, which he intended as a sort of manual for confessors. This work, in which the author displayed great learning, has been the subject of much animadversion, owing to the free manner in which the subject is treated. It was first printed at Geneva, folio, 1602, and has subsequently gone through fifteen different editions. He also wrote *Opus Morale in Præcepta Decalogi*, Mad., 1613; and *Consilia, seu Opuscula Moralia*, Lyon, 1634-35. Sanchez died 19th of May 1610, at Granada, where he was interred with great pomp.

SANCHUNIATHON, a Phœnician writer, whose era is not certain; some make him a contemporary of Queen Semiramis (Euseb., *Præp. Evang.*, i. p. 31; x. p. 485), and others say that he lived about the time of the Trojan war. (Porphy. ap. Euseb., l. c.; Suidas, s. v. Σαγχουνιάθων.) His birthplace, according to the general opinion, was Berytus, though Athenæus (iii. p. 126, where however the common reading is Σουναίθων) and Suidas call him a Tyrian. He was the contemporary of Adonilabas, a king of Byblos, to whom he was engaged as secretary; and it was at the request of this king that he wrote his principal work. Suidas mentions the titles of two works of Sanchuniathon, one called *περὶ τῆς Ἑρμῶς φυσιολογίας*; another *Αἰγυπτιακῆς θεολογίας*. Athenæus speaks of the *Φοινικικὰ* of Sanchuniathon, that is, 'A History of Phœnicia,' which by other ancient writers is called *Φοινικικὴ ἱστορία*, or *Φοινικῶν θεολογία*. (Porphy., *De Abstin. ab Anim.*, ii. p. 94; Theodoret, p. 34.) But these three titles probably refer to different portions of the same work, namely, to his 'History of Phœnicia,' in which he described the religious as well as the profane history of his own country, and also the theology of Egypt. He is said to have derived most of his information from the books of Taaut (Hermes), or from Hierombal, a priest of the god 'Ιεῦά (perhaps Jehovah); and if the latter be the same as Jerobaal (Gideon) in the book of Judges, Sanchuniathon must have lived in the 14th century before the Christian era. But little confidence can be placed in these and similar conjectures, and some critics have gone so far as to deny the existence of Sanchuniathon.

The original works of Sanchuniathon, which were written in the Phœnician language, are now lost, and even the ancients who speak of them do not appear to have been acquainted with them in the original language, but they speak of a Greek translation made by Philo of Byblos, a grammarian who lived during the latter half of the first century of our era. The original work of Sanchuniathon is said to have consisted of eight books (Porphy., *De Abstin.*, ii. p. 94), but the translation of Philo was divided into nine books. (Euseb., *Præp. Evang.*, i. p. 31.) The work of Eusebius just referred to contains a considerable fragment of the history of Sanchuniathon, which gives an account of the gods of the Phœnicians and Egyptians, and till within the last few years this and a few other fragments, as translated by Philo, were the only parts of the work of Sanchuniathon which were known. A very useful edition of these fragments was published at Leipzig in 1826, by J. C. Orelli, under the title *Sanchuniathonis Berytii Fragmenta de Cosmogonia et Theologia Phœnicium*, Gr. et Lat. recogn. emend. not. sel. Scaligeri, Bocharti, G. J. Vossii, Cumberlandi aliorumque permult. suisque animdv., illustr. J. C. Orelli. But in the year 1835 a manuscript containing the whole of the nine

books of Philo's translation of Sanchuniathon was said to have been discovered in the convent of Santa Maria de Merinhao, in the province of Entre Douro e Minho in Portugal, by Colonel Pereira, or, according to others, by a German surgeon. The announcement of the discovery of so important a work created a great sensation throughout Europe; but the opinions of scholars were divided: some declared the work to be a forgery of Philo, while others, and especially Grotefend, exerted their utmost to prove that the work was the real translation of Sanchuniathon made by Philo. The controversy was at the time carried on with great zeal in Germany, and the result was, that at last almost all scholars agreed that the work was spurious. In 1836 Wagenfeld published a German translation of it, with an introductory discourse by Grotefend, under the title *Sanchuniathon's Urgeschichte der Phœnizier in einem Auszuge aus der wieder aufgefundenen Handschrift von Philo's vollständig. Uebersetzung nebst Bemerkungen von Fr. Wagenfeld mit einem Vorworte von G. F. Grotefend, mit einem Facsimile*, Hanover, 1836. The year following there appeared *Sanchuniathonis Historiarum Phœnicie libros novem, Græce versos a Philone Biblio, edidit Latinaque versione donavit F. Wagenfeld*, 8vo, Bremæ, 1837; and another German translation, *Sanchuniathon's Phœnicische Geschichte; nach der Griechischen Bearbeitung des Philo von Byblos ins Deutsche übersetzt, mit einer Vorrede*, 8vo, Lübeck, 1837. Compare, on Sanchuniathon in general, J. A. Fabricius, *Biblioth. Græc.*, vol. i., p. 222, &c.; and respecting the controversy on the new discovery, C. L. Grotefend, *Die Sanchuniathonische Streitfrage nach ungedruckten Briefen gewirdigt*, 8vo, Hanover, 1836; Schmidt, *Der neuentdeckte Sanchuniathon, ein Briefwechsel*, 8vo, Altona, 1838; and Movers, *Die Phœnizier*, p. 116, &c.

SANCROFT, WILLIAM, an eminent and learned prelate of the English Church, was born at Fresingfield in Suffolk, on the 13th of January 1616. Being remarked while at school for his piety and extraordinary powers and attainments, he was early destined for the Church, and sent to study in Emmanuel College, Cambridge. He was living in the university in 1642, but some time after lost his fellowship at Emmanuel College in consequence of his refusal to take the Solemn League and Covenant.

While in the university he was a most diligent student. We are not informed what he did from the time when he lost his fellowship to the return of the king, but it was during this period that he produced the work entitled *Modern Policies and Practices*, a work containing statements of general principles in politics, but intended plainly to bear on the prevalent doctrines and principles of the day. Some part of the time was spent abroad. A little before the king's return he was in England, and chosen one of the university preachers; in the same year he was collated to the rectory of Houghton-le-Spring, and made a prebendary of the church of Durham. His rise was now rapid: in 1662 he was made Master of Emmanuel; in 1663, Dean of York; in 1664, Dean of St. Paul's; in 1663, Archdeacon of Canterbury; and in 1678, Archbishop of Canterbury.

While in this high dignity he performed many useful works. But a change was at hand. King James II. found no countenance from the archbishop in his designs to introduce Popery, nor passive acquiescence, and when he had issued his declaration for liberty of conscience, and required the clergy to publish it, Sancroft refused, and, accompanied by six other bishops, presented a petition to the king against the declaration. This petition was treated as a libel, and the seven prelates were committed to the Tower, but on their trial were acquitted. In the same year he was much employed in endeavouring to effect a comprehension of the Dissenters and the Church. He concurred in the declaration for a free parliament when King James had withdrawn himself; but when the Prince and Princess of Orange were declared king and queen, he, together with several other of the prelates and many of the inferior clergy, refused to take the required oaths, and he was in consequence deprived of his dignity.

Tillotson was nominated his successor; and as to Sancroft himself, he did not long survive. Retiring to Fresingfield, the place of his birth, he lived there in a state of great seclusion till his death, which occurred on the 24th of November 1693. He was buried in the churchyard of that place, under a tomb, the inscription on which, written by himself, is characteristic and remarkable:—"William Sancroft, born in this parish; afterwards, by the providence of God, archbishop of Canterbury; at last, deprived of all which he could not keep with a good conscience, returned hither to end his life, and professeth here, at the foot of his tomb, that as naked he came forth, so naked he must return, the Lord gave, and the Lord hath given away (as the Lord pleases, so things come to pass), blessed be the name of the Lord." There is more of it, but this is the most striking part. Sancroft published a few sermons; dialogues entitled *Fur prædestinatus*, 12mo, 1651; *Modern Politics*, and one or two other works of little permanent value.

SANCTIUS. [SANCHEZ, DE AREVALO.]

SANCTORIUS, the Latinised form of the name of an eminent Italian physician, who was called in his own language Santorio. He was born in 1561, at Capo d' Istria, studied medicine and took his degree at Padua, and then settled at Venice as a practitioner, where he had considerable success. In 1611 he was recalled to Padua, and appointed professor of the theory of medicine in that university. He there commenced a series of observations on insensible perspiration,

which have made his name known throughout Europe, even among those who do not belong to the medical profession. "For the better carrying on these experiments," says Addison, in the 'Spectator,' No. 25, "he contrived a certain mathematical chair, which was so artificially hung upon springs that it would weigh anything as well as a pair of scales. By this means he discovered how many ounces of his food passed by perspiration, what quantity of it was turned into nourishment, and how much went away by the other channels and distributions of nature." He continued to lecture at Padua to numerous audiences for thirteen years, until his reputation occasioning his being frequently sent for to Venice by the people of distinction in that city, he resigned his professorship, in order to dedicate all his time to medical practice. His resignation was accepted, but the salary continued; and with this testimony of the public esteem he removed and settled finally at Venice, where he died in 1686, aged seventy-five. A marble statue was erected to his honour in the cloister of the Servites, where he was interred; and the College of Physicians at Venice, in return for a legacy which he bequeathed them, annually commemorate him in a laudatory harangue. He was the author of the following works:—1, 'Methodus vitandorum Errorum omnium qui in Arte Medica contingunt Libri XV,' Venet., folio, 1602, and several times reprinted. Haller, who gives a short analysis of its contents ('Biblioth. Medic. Pract.,' tom. ii., p. 351), says that there is much useful matter in it, and calls it "magnum moment. opus, et raro citatur." 2, 'Commentarius in Artem Medicinalem Galeni,' Venet., folio, 1612. "Fusissimum opus," says Haller, "ut tedium lectionis vix feras." 3, 'Ars de Statica Medicina Sectionibus Aphorismorum Septem comprehensa,' Venet., 12mo, 1614. This is the work by which his name is best known, of which there are numerous editions, and which was translated into several modern languages. The latest edition that the writer has seen quoted is that with a Commentary by A. C. Lorry, Paris, 12mo, 1770. There is a French translation by Le Breton, Paris, 8vo, 1722, and by Pierre Noguez, 12mo, 2 vols., 1725; an Italian one by F. Chiori, Venice, 1743; a German one, Bremen, 8vo, 1786; and an English one, London, 12mo, 1676, and another by Dr. Quincy, third edition, London, 8vo, 1723. It contains the results of a long series of observations made upon the weight of his own body, and the external causes which influenced its increase and diminution. He treats especially of insensible perspiration, on the due amount of which he makes health and disease depend. There is much curious and valuable matter in the work, though the advances of modern science have thrown some doubt upon the infallibility of some of his aphorisms. He unquestionably conferred a benefit on medical science by directing the observations of medical men to the functions of the skin; but unfortunately the doctrines were extended much too far; and coinciding with the mechanical principles which were coming into vogue after the discovery of the circulation of the blood, as well as with the chemical notions which were not yet exploded, they contributed to complete the establishment of the 'humoral pathology,' under the shackles of which the practice of medicine continued almost to our own times. 4, 'Commentarius in Primum Fen Primi Libri Canonis Avicennae,' Venet., folio, 1626. "Memorable opus," says Haller, "plenumque proprium inventorum et cogitationum apud auctorem primum natum." In it he describes an instrument that he had invented for measuring the force of the pulse, and several new instruments of surgery. He was also the first physician who attempted to measure by the thermometer (then newly invented) the heat of the skin in different diseases, and at different periods of the same disease. 5, 'Commentarius in Primum Sectionem Aphorismorum Hippocratis,' Venet., 8vo, 1629. A work not of much value. 6, 'Liber de Remediorum Inventionem,' Venet., 8vo, 1629, contains nothing remarkable except the account of some post mortem examinations. A letter by Sanctorius, 'De Calculo,' is inserted in Jo. van Beverwyck's 'De Calculo Renum et Vesicae Liber Singularis, cum Epistolis et Consultationibus Magnorum Virorum,' Lugd. Bat., 12mo, 1638. All his works were collected and published in four volumes, 4to, Venet., 1660.

SANDBY, PAUL, R.A., was descended from a branch of the family of Sandby of Babworth, and was born at Nottingham in 1725. In 1746 he came to London, and commenced his artist studies at the drawing school at the Tower. Two years afterwards he was appointed by the Duke of Cumberland draughtsman to the survey of the Highlands, under General Watson, and although chiefly employed in drawing plans, he made a large number of sketches, which he afterwards etched in Edinburgh, and published in folio in London in 1752. A series of seventy engravings of Windsor and Eton, taken during his residence at Windsor with his brother Thomas Sandby, afterwards obtained for him the patronage of Sir Joseph Banks, P.R.S., who purchased the whole of them at a very liberal price, and invited Sandby to accompany him and the Hon. Charles Greville on a tour through Wales. In the scenery of that country he found abundant material for his pencil, and of the fruits of this journey he subsequently dedicated to these, his early patrons, forty-eight plates engraved by himself in aquatinta from the drawings he then made.

In 1753-54, when the scheme for creating a public academy for the arts was first proposed, he was a member of the St. Martin's Lane Academy, and, warmly engaging in the controversy which arose, he ridiculed the opposition of Hogarth to the plan, in a series of etchings published anonymously, which signally exhibited his power as a caricaturist.

After the controversy was over, he withdrew the prints, and caused the plates to be destroyed. As a member of the Society of Artists he was a constant contributor to their exhibitions from 1760 to 1764. Subsequently, when the society obtained a royal charter of incorporation he was one of the twenty directors, but withdrew from that office after the dissension which followed, and in 1768 became one of the foundation members of the Royal Academy. In the same year he was appointed by the Master-General of the Ordnance chief drawing-master to the Royal Military Academy at Woolwich. This office he held till the close of his life with honour to himself and advantage to the institution. As a teacher of drawing he was eminently successful, and among his pupils and friends he subsequently numbered as correspondents the Earl of Buchan, Lord Harcourt, Lord Nuneham, Dr. Norbury (the provost of Eton), and the poets Mason and Gray; while among the professional artists under his instruction were M. A. Rooper, William Watts the engraver, and the father of Mr. J. D. Harding.

Paul Sandby painted in oil as well as in opaque colours with great success, but his name will be remembered chiefly as the founder of the English school of water-colour painting, he being the first to show the capability of that material to produce finished pictures. He went to nature for his prototype, and being thoroughly acquainted with the principles of linear perspective, he drew on their respective sites his views of cities, castles, and other objects, with characteristic truth and pictorial taste. In his early drawings the process by which he produced the cheerful daylight effects apparent in his landscapes, was to pen carefully the outline of every part of the composition without diminution of tint, distributing the shadows with Indian ink, and afterwards throwing a wash of colour over the whole. Although wanting the richness and brilliancy of modern water-colour painting, his works bear the impress of an original mind, and are efficient in all that regards light and shade, form and composition. As he advanced in years his colouring was more rich and varied, and his later drawings especially exhibit a pleasing harmony of tints.

Paul Sandby was the first English artist who adopted the method of aquatint engraving, which he brought to great perfection. The best specimens of this class are his views of the Encampments in the Parks in 1780, and of Windsor and Eton, engraved from his own drawings; the Sports of the Carnival at Rome, after David Allan; and Views in Italy and Asia Minor, after Clerisseau, &c. His etchings are also numerous, chiefly of views and compositions, but occasionally designs of subjects, as those illustrating the 'Cries of London,' Ramsay's 'Gentle Shepherd,' &c. Of his larger works on copper, the plates in the style of Piranesi, from Collins's paintings illustrating Tasso's 'Jerusalem Delivered,' and views in the West Indies and America, are the best.

A volume of 150 engravings, copied from his views in England and Wales, was published as 'The Virtuosi's Museum' in 1778. He died, regretted by a large circle of friends, to whom his warm-hearted kindness and benignity of disposition had endeared him, at his house No. 4, St. George's Row, Hyde Park, on the 9th of November 1809, and was interred in the burial-ground of St. George's, Hanover-square.

SANDBY, THOMAS, R.A., brother of the preceding, was born at Nottingham in 1721, and is said to have first had his thoughts directed to the arts as a profession, by having perseveringly pursued a new system of perspective which he brought to a state of great perfection and readiness of application. Encouraged by the reputation he acquired by a drawing of his native town made upon these novel rules, he came to London, and was in 1743 appointed draughtsman to the Chief Engineer in Scotland. In this capacity he was at Fort William in the Highlands when the Pretender landed, and was the first person who conveyed intelligence of that event to Government in 1745. In recognition of his merits and his services, William, duke of Cumberland, appointed him his peculiar draughtsman, and after the termination of the struggle in Scotland, he followed the Duke in his campaigns in Flanders. In 1746 he was made Deputy Ranger of Windsor Great Park, an appointment which he held for fifty-two years. In this capacity, combined with his professional position as architect to the king, he planned in 1754, the construction of the Virginia Water, the largest artificial lake in the kingdom, and shortly afterwards published a series of eight folio views illustrating the improvements and alterations in Windsor Great Park effected by his labours.

In 1755 he was one of the committee of artists who combined to propose a plan for the foundation of a public academy for the cultivation of the arts; in 1766 he belonged to the Society of Incorporated Artists of Great Britain; and in 1768, on the formation of the Royal Academy, he was appointed the first professor of architecture at that institution, in which capacity he continued annually until 1798 to deliver lectures on architecture, largely illustrated by his own drawings. These lectures were never published, but the original manuscript was presented by the late John Britton to the library of the Royal Institute of British Architects. A large number of his drawings are in the Soane Museum and the print-room of the British Museum, and display both architectural correctness and pictorial taste. Freemasons' Hall in London was built from his design in 1775; and in 1768 he gained the first prize in the competition for the erection of the Royal Exchange in Dublin equally with Cooley, but the latter being an Irishman obtained the commission. A design by him for an ornamental bridge

across the Thames at Somerset House attracted great attention at the time, but it was never proposed to be erected from the great expense which would have attended its construction.

Thomas Sandby died at the deputy-ranger's lodge in Windsor Great Park on the 25th of June 1798, in his seventy-seventh year, and was buried at Old Windsor.

SANDEMAN, ROBERT, a native of Perth in Scotland, was born in 1718. Having married Catherine, daughter of Mr. John Glas, a minister in the Presbyterian church, who was removed in the year 1728 from his office on account of certain peculiarities of religious opinion, Mr. Sandeman adopted the views of his father-in-law and devoted himself to their promulgation. In 1757 he published his *Letters on the 'Theron and Aspasia'* of Mr. James Hervey, in which the peculiarities of the Glassite system are exhibited in a popular manner. In 1758 he began a correspondence with Mr. Samuel Pike, an Independent minister of note in London, who adopted his views, and in 1760 he removed to London, where he preached in various places, and attracted much notice. He formed a congregation in London in 1762. In 1764 he removed to the American Colonies, where he continued till his death. The leading doctrine of the Sandemanians is thus expressed in the epitaph on Mr. Sandeman's tomb at Danbury in New England:—"Here lies, until the resurrection, the body of Robert Sandeman, who, in the face of continual opposition from all sorts of men, long and boldly contended for the ancient faith, that the bare death of Jesus Christ, without a deed or thought on the part of man, is sufficient to present the chief of sinners spotless before God." Sandeman, in reference to the nature of justifying faith, describes it as no more than a simple 'assent' to the divine testimony, passively received by the understanding.

The Sandemanians in London met first for public worship at the hall of the Glovers' Company, afterwards at an old meeting-house of the Quakers in Bull and Mouth Street, and from 1778 at a chapel in Paul's Alley, Barbican. The best account which has been given of this sect is to be found in *'The History and Antiquities of the Dissenting Churches in London,'* by Walter Wilson, in 4 vols. 8vo (vol. iii. p. 261-276). After giving a more detailed account of the faith of this body of persons, he proceeds "to unfold some of those practices by which they are distinguished from other Christians: these are, their weekly administration of the Lord's supper; their love-feasts, of which every member is not only allowed but required to partake, and which consist in dining either in the vestry of their meeting-house or at each other's houses in the interval between the morning and afternoon services; their kiss of charity at the admission of a new member, and at other times when they deem it necessary and proper; their weekly collections before the Lord's supper, for the support of the poor and defraying other expenses; mutual exhortation; abstinence from blood and things strangled; washing each other's feet, when, as a deed of mercy, it might be an expression of love; community of goods, by which any one is to consider the whole of his property liable to the calls of the poor and of the church; and the unlawfulness of laying up treasures upon earth, by setting them apart for any distant, future, and uncertain use. Agreeably to this, they do not allow of putting out money to interest. They allow of public and private diversions, so far as they are not connected with circumstances really sinful; and, apprehending a lot to be a thing sacred, they disapprove of lotteries and games of chance." At the census, taken in 1851, the Sandemanians in England numbered six congregations, with an attendance on the Census Sunday of 439 in the morning, 256 in the afternoon, and 61 in the evening. In Scotland the number of congregations was six, with a maximum attendance of 554. In America the Census report does not specify the number of Sandemanian congregations, and they are therefore probably very few.

SANDERSON, ROBERT, Bishop of Lincoln, was born at Rotherham in Yorkshire, September 19, 1587. So rapid was the progress he made at the grammar-school of his native town, that at the age of thirteen he was sent to Lincoln College, Oxford. In 1606 he was elected fellow, and in 1608 reader in logic in that college: his logic lectures were published under the title *'Logicæ Artis Compendium,'* in 1615, and passed through several editions. Having some years earlier taken holy orders, he was in 1615 presented by his cousin, Lord Castleton, to the rectory of Wibberton, near Boston, Lincolnshire, but exchanged it the following year for the rectory of Boothby Pannell, in the same county, which he retained for above forty years. He now resigned his fellowship, and married; was made prebend of Southwell, and in 1629 of Lincoln. He was also chosen as clerk in convocation for the diocese of Lincoln.

Having become known to Laud, then Bishop of London, that prelate recommended him as one extremely skilled in casuistical learning to Charles I., who appointed him his chaplain, and soon conceived a great esteem for him. Being with the king at Oxford, in 1636, he was created D.D. In 1642 he was appointed by the king regius professor of divinity at Oxford, but the state of public affairs did not permit him to enter upon that office till 1646, and he was then unable to hold it for more than a year. In 1643 the parliament named him one of the Assembly of Divines, but he never sat amongst them, and as he refused to sign the Covenant his living was sequestered; indeed to Sanderson is ascribed the principal share in drawing up *'The Reasons of the University of Oxford against*

the Solemn League and Covenant, the Negative Oath, and the Ordinances concerning Discipline and Worship.'

When the parliament made their "proposals to the king for a peace in Church and State," Dr. Sanderson was one of the four divines whom Charles requested to be allowed to attend him for the satisfaction of his conscience as to how far he might yield assent to these proposals. The request was refused at the time, but afterwards Sanderson was permitted to attend him both at Hampton Court and the Isle of Wight; and the result of their private conferences is said by Walton to have been that the king laid on Sanderson an injunction to consider and report on the proposition for the abolition of episcopacy, and also to write on certain cases of conscience. The result of these requests was the preparation of Sanderson's treatise, *'Episcopacy as established by Law in England not prejudicial to Regal Power,'* 8vo, published in 1661 and 1663; and also his celebrated *'Nine Cases of Conscience Resolved,'* printed at different times, but first collected in 1678.

On being ejected by the parliamentary visitors from his professorship in 1648, Dr. Sanderson retired to his living of Boothby Pannell; but this was placed under sequestration, and he was arrested. He was however soon after exchanged for a puritan divine held in custody by the royalists, and his living restored under certain conditions, though he was several times afterwards molested and on one occasion wounded by a party of soldiers. At the restoration Dr. Sanderson was reinstated in his professorship, and shortly after made Bishop of Lincoln. His liberal conduct in this office gained him general esteem, but he enjoyed it little more than two years, dying on the 29th of January 1663 in his seventy-sixth year.

Besides the works above mentioned, Bishop Sanderson wrote *'De Juramenti Obligatione,'* 8vo, 1647, and several times reprinted: Charles I. is said to have translated this work during his imprisonment in Carisbrook Castle, his version being printed at London in 1655; *'De Obligatione Conscientiæ,'* 4to, 1661; *'Censure of Mr. Antony Ascham his book of the Confusions and Revolutions of Government,'* 8vo, 1649; *'The Power communicated by God to the Prince and the Obedience required of the Subject,'* and *'Clavi Trabales: or Nails fastened by some great Masters of Assemblies, concerning the King's supremacy, the Subject's duty, and Church Government by Bishops,'* 4to, 1661—both inserted in a collection of treatises by Archbishop Usher. The following were published posthumously. *'Sermons (36 in number), preached and printed at different times,'* with the Author's life by Izaak Walton prefixed, folio, 1681, at the end of the memoir is printed *'Pax Ecclesiæ: about Predestination';* *'Discourse concerning the Church in these particulars;—first concerning the true Church, secondly concerning the Church of Rome,'* published by Dr. Asheton in 1688. Bishop Sanderson has always been esteemed one of the most able and clear-headed of the writers on casuistry produced by the English church, but his writings are probably little read now.

SANDOVAL, FRAY PRUDENCIO DE, an eminent Spanish historian, was born at Valladolid, others say at Monterey in the province of Galicia, about 1560. His parents having educated him for the church, he took the monastic orders at the Benedictine convent of Santa Maria la Real de Naxera, where he passed several years, devoting all his attention to the study of the civil and ecclesiastical antiquities of Spain. Having gained some reputation by his writings, he was made abbot of San Isidro de Guengua at Valladolid, and soon after appointed historiographer to Philip III. This monarch charged him with the continuation of the *'Cronica General'* of Ambrosio de Morales [MORALES], which Sandoval published under the title of *'Historia de los Reyes de Castilla y de Leon.'* Other historical works, which he published at the same time, attracted the notice of Philip, and he was rewarded by him with the bishopric of Tuy in Galicia, which Sandoval held until he was translated to that of Pamplona in 1612. Sandoval's whole life was spent in visiting the public archives and principal libraries in Spain, where he found many interesting documents. He died at Pamplona, March 17, 1621, at the age of sixty-one. Besides the above, Sandoval wrote several other works on the history and antiquities of his native country, among which the following are the most deserving of notice:—*'Cronica del Inlyto Emperador de España Don Alonso VII.,'* fol., Mad. 1600: this is a chronicle of Alfonso, king of Castile and Leon, surnamed "the Emperor." *'Historia de la Vida y Hechos del Emperador Carlos V.,'* in two parts (fol., Valladolid, 1604), Pamplona, 1614, and Antw. 1681. This is a work of great value: there are two old English translations, or rather abridgments, of it; one by James Wadsworth, under the title of *'The Civil Wars of Spain,'* fol., Lond., 1652; the other by Captain John Steyens, *'History of Charles V.,'* 8vo, Lond., 1703. *'Antigüedad de la Ciudad y Iglesia Cathedral de Tuy,'* 4to, Braga, 1620. *'Catalogo de los Obispos de Pamplona,'* fol., Pamp., 1604. *'Regla e Instruccion de San Leandro,'* 8vo, Valladolid, 1604. He also edited the chronicles of Isidorus Pacensis, Sebastianus Salmanticensis, Sampirus, bishop of Astorga, and Pelagius Ovetensis, all writers of the twelfth century, the whole being published in a volume under the title of *'Las Cronicas de los Quatro Obispos,'* fol., 1615 and 1634. Sandoval is justly considered by Spaniards one of their best historians. His style is clear and unaffected, and his erudition vast, though, like most writers of his time, he is occasionally led away by a strong spirit of nationality.

SANDRART, JOACHIM VON, well known as a painter and engraver, but more celebrated for his writings on the arts, was born at Frankfurt on the Main, in 1606. Having received a good general education, he devoted himself to the study of the arts, and was first instructed in engraving by Theodore de Bry and Matthew Merian. When he was only fifteen years of age, he went to Prague, where he was for some time instructed in engraving by Giles Sadeler, who however advised him to apply to painting, which he judged to be better suited to his genius. He accordingly went to Utrecht, where he became a pupil of Gerhard Honthorst. Under this able teacher he made great progress, so as to be shortly able to assist his master in many of his most important works.

Descamps affirms that when Honthorst was invited to England by Charles I., he engaged Sandrart to accompany him, that the king bespoke many pictures of him, that he copied several portraits by Holbein for the Earl of Arundel, and that he remained in England till 1627 (in which case he would have been only twenty-one years of age), when he went to Venice. Pilkington's Dictionary, edited by Fuseli (1818), gives a similar account. But Bryan (1816) says "there appears to be very little authority for this account. No picture of Sandrart's is mentioned in king Charles's collection, and what renders the story of his having been in England more improbable, is that he takes no notice of it himself in his 'Life of Honthorst,' though he mentions that artist's journey to England, and gives an account of his works here." It is certain that he spent several years in Italy. At Venice he copied the finest pictures of Titian and Paul Veronese, and at Rome was much employed by Cardinal Barberini and Prince Giustiniani. After a long residence in Italy he returned to Frankfurt, and executed many considerable works for the emperor Ferdinand, and for Maximilian, duke of Bavaria. He passed the latter years of his life at Nürnberg, where he died in 1683, aged 77 years. At Nürnberg he published several works, particularly his *Lives of the Painters*, under the title of 'Academia Artis Pictoriæ.'

SANDYS, GEORGE, an English poet, was born in 1577, at the palace of Bishopthorpe, his father, Dr. Edwin Sandys, being then Archbishop of York. In 1589, the year after his father's death, he was sent to Oxford, and became a member, first of St. Mary Hall, and was afterwards, as Wood thinks, of Corpus Christi College. ('Athen. Oxon.') We have no account how he passed his time between this period and the year 1610, when he commenced his travels in the East, returning, as Wood supposes, "in 1612, or after, much improved in several respects, being master of several languages, of a fluent and ready discourse, and of excellent comportment; having naturally a poetical fancy, and a zealous inclination to all human learning, which made his company desired and most acceptable to most virtuous men and scholars of his time." His account of his travels was published in 1615, being dedicated to Charles, then Prince of Wales, and entitled 'A Relation of a Journey begun in 1610, in Four Books, containing a Description of the Turkish Empire, of Egypt, of the Holy Land, and of the remote parts of Italy and islands adjoining.'

After this Sandys went to America, and appears to have succeeded his brother as treasurer for the English colony of Virginia. During his residence he completed his translation of the 'Metamorphosis' of Ovid, on which he had been for some time engaged. On his return to England he was appointed one of the gentlemen of the privy chamber to the king. In 1636 he published a 'Paraphrase upon the Psalms,' and two years afterwards 'Paraphrases on the Book of Job, Ecclesiastes, the Lamentations of Jeremiah, and Songs selected out of the Old and New Testament;' in 1639 a translation of 'Christ's Passion,' a tragedy by Grotius. His last work was the poetical version of the 'Song of Solomon,' in 1642. He died at Bexley Abbey, in Kent, March 1643-44.

The writings of Sandys are simple, earnest, and devout; his travels are learned without pedantry, and circumstantial without being tedious; and are valuable for the picture they give of the East in his time, particularly of Jerusalem. His poetical writings contributed, like those of Carew and Herrick, to the formation of a well-tuned and harmonious versification, the natural accompaniment of the refined purity of thought and expression for which they are distinguished. His merits in this respect have been acknowledged by Waller, Dryden, and Warton. Specimens of his most beautiful compositions, both in poetry and prose, are given in the Memoir of his Life, by the Rev. H. J. Todd, prefixed to 'Selections from Sandys's Metrical Paraphrases,' &c., London, 1839, from which biography this sketch is taken.

SANGALLO, or SAN GALLO, a family of distinguished Italian artists and architects, whose original name was Giamberti.

1. GIULIANO GIAMBERTI, born in 1443, was the son of Francesco Giamberti, who was himself an architect of some repute in the service of Cosmo de' Medici. At first both he and his brother Antonio chiefly practised carving in wood, in which they acquired some celebrity. Giuliano was next employed in the capacity of military engineer by Lorenzo de' Medici, who rated his services very highly. So patronised, Giuliano determined on pursuing architecture as his profession; and he had soon an opportunity of displaying his talent in the fore-court or cloister of the church of Santa Maddalena de' Pazzi at Florence, wherein he introduced an Ionic order, whose capitals are remarkable for having an ornamental necking, at that time an innovation, and said to have been imitated from an antique fragment found at Fiesole. He

was afterwards commissioned by Lorenzo himself to erect a large convent (destroyed during the siege in 1530) near the gate of San Gallo, whence he obtained the name of 'Da San Gallo,' at first jestingly bestowed on him by his patron, and afterwards adopted by himself and the rest of his family. In 1490 he commenced the Palazzo Gondi for a wealthy merchant of that name, but, owing to the death of the latter, the building was not completed; nevertheless, what was executed is, with some imperfections, a fine specimen of the Florentine style. Among his numerous other works was a palace erected by him at Savona, for his patron the Cardinal della Rovere (now converted into the convent of Santa Chiara), besides other buildings for the same prelate. When Rovere was elevated to the pontificate by the title of Julius II., Sangallo expected to be employed as architect of the new St. Peter's church, but being supplanted by Bramante, he retired in disgust to Florence. On the election of Leo X. he returned to Rome, and on the death of Bramante was offered the appointment of architect of St. Peter's, but he declined it on account of his age and infirmities, and returning to Florence, died there two years afterwards (1517), at the age of seventy-four.

Giuliano had a son named Francesco, who is spoken of by Vasari as a skilful sculptor then living, and who executed the mausoleum erected at Monte Cassino by Clement VII. in honour of Piero de' Medici.

2. ANTONIO SANGALLO, brother of the preceding, was induced by him to quit the profession of sculpture for that of architect, and was left by him to complete the palace he had begun at Savona. He afterwards visited Rome, where he ingratiated himself with Alexander VI., to whom he proposed to convert Hadrian's mausoleum into a fortress, and he altered that building into its present form, since which time it has been called the Castle of St. Angelo. This work gave so much satisfaction, both to the pope and to his son the Duke Valentino, that the latter employed him to erect the fortress of Civita Castellana, and afterwards that of Montefiascone. He likewise erected several churches, among which that of the Madonna at Montepulciano is esteemed his best production of that class. Some time before his death, in 1534, he gave up both architecture and sculpture, and amused himself with agricultural pursuits.

3. ANTONIO SANGALLO, the most noted of the family, was nephew to the two preceding on the mother's side, from whom he received their surname, that of his father, who was a cooper at Mugello, being Bartolomeo Picconi. He was at first put to the business of a common carpenter, but the fame of his uncles determined him to set out for Rome, and become their pupil; and when they quitted that city, he found another instructor and protector in Bramante, to whom, then advanced in years, he soon rendered himself a most useful assistant. Nor was it long before his talents obtained for him the notice of persons of rank, among the rest of Cardinal Alexander Farnese (afterwards Paul III.), who employed him to rebuild his mansion in the Campo de' Fiori, the first beginning of that splendid pile, which would of itself alone have established the reputation of Sangallo. One of his earliest works was the church of la Madonna di Loretto, near Trajan's pillar; but as that edifice was begun in 1507, it is doubtful whether he did more than afterwards complete it. His other works of the same period were several private mansions or palazzi, especially one for Marchionne Baldassini; but as neither the buildings themselves are described nor their sites distinctly indicated by Vasari and his other biographers, and as many of them have repeatedly changed their names, it is now difficult to specify or ascertain them. It is equally difficult to determine their respective dates; and we may therefore break through chronological order, and mention here the house that he afterwards built for himself in the Strada Giulia, now known as the Palazzo Sacchetti.

Passing by the various works on military architecture, upon which he was employed at different times at Civita Vecchia, Parma, Piacenza, Ancona, and other places, we shall proceed to consider Sangallo's project for completing St. Peter's. After the works had been nearly suspended for several years, Paul III. determined that they should be resumed vigorously, and on the death of Peruzzi, in 1536, Sangallo became the sole architect. With the view of preventing those changes which had been made by all the preceding architects, the pope ordered him to prepare a model, upon such a scale and in such an expensive manner, that there should be no danger of its being either forgotten or destroyed. This model, which is said to have taken several years to execute, and to have cost upwards of 5000 crowns, is still preserved in one of the rooms of the Vatican. It is formed of wood, and is in length 35 Roman palms, or nearly 20 English feet. Little more however was done to the fabric by Sangallo than to strengthen the parts already erected; and after his death his design was abandoned altogether, not a trace of it being visible in the present structure. An elevation of Sangallo's model is given in the first volume of Wood's 'Letters of an Architect,' from which it may be seen that if it had been followed, the building would have been totally different from what it now is. The cupola would have had two orders, one around the tambour, another carried up above the spring of the dome, which would also have been of much lower proportions than the present one, while other very conspicuous features would have been two exceedingly lofty and tapering campanili, contrasting and at the same time harmonising with the cupola itself. It is true the design is broken into a multiplicity of parts, yet they are both agreeably proportioned

to each other, and picturesquely combined; and the whole is consistent in character, which is more than can be affirmed of Maderno's façade, where there is a want of agreement between the order itself and the other parts, and also a deficiency in variety of outline.

The Palazzo Farnese, begun by him for his patron Paul III. when cardinal, and afterwards greatly extended, is the most celebrated of Sangallo's works. He must however share the repute of it with Michel Angelo, who, if he did not, as some have supposed, add the third tier of windows, designed the magnificent and majestic cornice, which alone distinguishes this edifice from every other of the kind in Rome, and, aided by the loftiness and extent of the edifice itself, gives it a colossal air. This noble structure deserves notice, if only because it has been said that the Reform Club-House, Pall-Mall, is an imitation of it, which is true only as regards style and manner; for in regard to design there are quite as many points of dissimilarity as of resemblance between them, and many of them are to the advantage of Mr. Barry's building. Sangallo began the Porta S. Spirito at Rome, but left it unfinished, in which state it has ever since remained. He died at Terni, in October 1546, advanced in years, but at what precise age is not known. His body was carried to Rome and buried with great pomp.

SANMICHELE, MICHELE, a master equally celebrated for his works in civil and military architecture, was born in 1484 at Verona, where both his father Giovanni and his uncle Bartolomeo pursued the same profession. By them he was instructed in the elements of the art, but he caught its spirit from studying the amphitheatre and other remains of antiquity in his native city; and their influence, especially that of the former, is visible in many of his designs, wherein he greatly affected massive rusticated work. About the year 1500 he set out for Rome, and remained either there or in other parts of the ecclesiastical states till the time of Clement VII., and was intimate with all the more celebrated artists of the time—Bramante, Michel Angelo, the Sangalli, Sansovino, and others. While he was in that part of Italy he erected the cathedral of Montefiascone (the cupola of which was destroyed by fire at the beginning of the 17th century, and has since been rebuilt in a tasteless manner), and the church of San Domenico at Orvieto. Returning to the Venetian territory, he was employed by the republic (1525) to construct the new fortifications of Verona, when he first introduced the use of triangular and pentangular bastions, and thereby entirely changed the system of military architecture, that method being thenceforth adopted by other engineers. Here it will be sufficient merely to allude to his works of that class, as they belong to construction rather than design, though some of them are remarkable even in the latter respect; for instance, the stately rusticated façade of the fortress or Castello di San Andrea on the Lido at Venice, and the three fortified gates at Verona, Porta Nuova, Porta del Palio, and Porta Zenone.

He was next employed by the republic in fortifying many places in Istria and Dalmatia, Cyprus and Candia, some of which works he confided to the execution of his nephew Gian-Girolamo. In consequence of their reputation, both uncle and nephew were invited by Francis I. and the emperor Charles V. to enter their service, which flattering offers they nevertheless rejected. Whether these numerous engagements, and his divided application to two such very opposite studies, did not prevent Sanmichele from attaining to that excellence in the latter which he might else have reached, may fairly be questioned; for, with many merits, his designs often exhibit glaring faults, which, if he had confined himself entirely to the study and practice of civil architecture, he would perhaps not have fallen into. In fact, the best of his palazzi and other works of that class are far from being models, except as to their façades and exteriors, being most inconvenient in their plans, besides abounding with monstrous deformities, such as rooms quite out of square, and sometimes with no two sides parallel; and in one instance (Palazzo Bevilacqua) he has placed the principal staircase in an open court, without any protection whatever from the weather. His exterior architecture exhibits less of mannerism, and more both of invention and nobleness of taste than that of Palladio, but also not a little that is decidedly faulty and offensive. Almost all his buildings are marked by a disagreeable inequality of design, there being a singular mixture of parts highly enriched and others nakedly plain in the same composition. His balustrades to windows and pedestals to columns are too high, and in more than one instance he has raised his columns on a second pedestal over the first one. His style shows itself to most advantage in his lofty rusticated basements, which generally possess an air of dignity. Among the palazzi erected by him are the Palazzo Grimani and the Palazzo Cornaro à San Paolo at Venice, and the palazzi Canossa, Bevilacqua, Verza, Pelligrini, and Pompei at Verona. In Verona he also built the church of the Madonna di Campagna, and the much-admired Cappella Pellegrini. While Sanmichele was enjoying a tranquil and honourable old age, esteemed by all no less for his personal qualities than for his talents, he received the intelligence of the death of his nephew and pupil Gian-Girolamo, who died in the island of Cyprus at the age of forty-four; and it had such an effect upon him that he survived the fatal news only a few days, dying in 1559, in his seventy-fifth year.

SANNAZARO, JA'COPO, was born at Naples July 28, 1483, of a noble family originally from Spain. He studied at Naples, and afterwards, being disappointed in love, left his country and travelled to

France, where he began writing his 'Arcadia,' a pastoral fable in Italian, in which he describes in poetical colours the scenes and occupations of pastoral life. It is a mixed composition of prose and verse, and has been much admired for the elegance of the style and the purity of the language. Indeed Sannazaro is considered as one of the best Italian classics. The 'Arcadia' has gone through numerous editions. Sannazaro also wrote a Latin poem, 'De Partu Virginis,' which was highly applauded, and which obtained for the author the sanction of two popes, Leo X. and Clement VII., expressed in two briefs. He also wrote Piscatory Eclogues in Latin verse. On his return to Naples, where he was highly esteemed by King Ferdinand I. and his sons Alfonso and Frederic, he fixed his residence on the delightful shore of Mergellina, at the foot of Mount Posilipo, where Frederic, the last king of Naples of the Aragonese dynasty, had given him a country-house, and where he saw before him the daily occupations of the fishermen under a sky and in a climate which render their labours less irksome, and impart to them a sort of poetical appearance. When the Aragonese dynasty was driven away from Naples by the treachery of their relative Ferdinand the Catholic of Spain, Sannazaro accompanied his patron King Frederic in his exile, and remained with him in France till Frederic's death, after which he returned to Naples, where he died in 1530. He was buried in a church on the slope of Posilipo, which he had built and dedicated to the Virgin, and where his monument is still seen.

SANSON, NICOLAS, designated the creator of geography in France, was born at Abbeville, December 20, 1600. His father, of the same name, being passionately fond of geography, wished all his sons to cultivate that science, but Nicolas responded best to his desire. He was educated at the Jesuits' college at Amiens, on leaving which he returned to his family, and for a time devoted himself wholly to the study of geography. At an early age (barely sixteen, according to the 'Biog. Univ.'), he laid down a map of ancient Gaul, superior to those of Ortelius and Gerard Mercator; but he did not immediately publish it, lest, according to some authorities, it should be attributed to his father; or perhaps, from not thinking it sufficiently correct for publication.

Sanson married early, and applied himself to commerce, to meet the claims of his family; but so much of his time was devoted to his favourite studies, that his affairs became embarrassed, and, having suffered great losses, he ceded his remaining effects to his creditors, and in 1627 went to Paris, taking with him his map of Gaul. The talent displayed in this production, which was published in the year just mentioned, obtained for him the patronage of Richelieu, by whom he was introduced to Louis XIII., who took lessons in geography from him, and employed him as an engineer in Picardie. He soon went to his destination, examining the works of the towns in that province, and returned to Abbeville, where he superintended the repair of the fortifications. In 1638, Louis XIII. being in Picardie to direct the operations of the army, lodged, while at Abbeville, in Sanson's house, and displayed great regard for the geographer, who frequently accompanied him on his excursions, and had the honour of being several times called to the council. His duties as engineer did not diminish his zeal for geography, and he published many maps; but having disagreed with the person who managed their sale, Sanson established himself at Paris, about 1640, to superintend their publication in person. Soon after this he received the brevet of geographer to the king, and a pension of 2000 livres. He was also made a councillor of state, but did not assume the rank and titles of that office, lest his children should be induced to abandon the study of his favourite science. His incessant labours brought on an illness, of which, after lingering nearly two years, he died at Paris, July 7 (or, according to the account in 'La France Littéraire,' July 16), 1667.

The maps of Sanson are very numerous, amounting, it is said, to about three hundred; of which a great number were devoted to an accurate delineation of France. Though the services he rendered to geography were very important, he has been blamed for working too hastily, and not taking sufficient advantage of astronomical observations for the improvement of his maps. He published many works to accompany his maps, and others on geographical subjects. In a dissertation entitled 'Britannia, ou Recherches sur l'Antiquité d'Abbeville,' 8vo, 1636, he attempts to prove that Abbeville is the Britannia mentioned by Strabo (iv., p. 190, Casaub.), and that she furnished the first colony established in Great Britain, and gave her name to the country. On turning to Sanson's dissertation (p. 4), it appears that he misunderstood the original, which simply says that neither the people of Massalia (Marseille), nor those of Narbo and Corbilo, with whom Scipio conversed, could give him any information about Britannia. But "this learned and curious dissertation," as it is styled in the 'Biographie Universelle,' compels us to form a very low estimate of Sanson's critical sagacity, though these (Narbo and Corbilo) were the chief cities in this part of Gaul. His 'Tables méthodiques' of the divisions of the dominions of Christian princes, engraved on about a hundred folio plates, were first published in 1644, and passed through several editions. Sanson's map of ancient Gaul was attacked by a Jesuit, Father P. Labbe, who nevertheless copied largely from it without acknowledgment. This led to a reply, in which the mistakes and plagiarisms of Labbe were exposed; but only a portion of the reply was published, the remainder being destroyed by Sanson in consequence of the mediation of the

chancellor Seguer. His maps were collected into an atlas by his sons, and published in two folio volumes, in 1693. In the 'Bibliothèque du Roi' is preserved a manuscript dissertation by Sanson, in which he endeavours to prove that Boulogne was the Portus Itius of Cæsar. There is a portrait of Sanson, engraved by Edelinck.

Sanson had three sons, all of whom followed in his steps. Nicolas, the eldest, was killed August 27, 1648, in defending the chancellor Seguer from the fury of the populace, at the age of twenty-two. Adrien, the next son, succeeded his father as geographer to the king, and died in 1718. Guillaume, the youngest, in concert with his brother, continued the publication of maps and geographical works, and died in 1703. Adrien was succeeded in the business of publication by his nephew, P. M. Sanson.

**SANSOVINO, JACOPO TATTI.** This eminent artist, equally distinguished as sculptor and architect, was born at Florence in 1479. He was the son of Antonio Tatti, whose surname he afterwards exchanged for that by which he is now universally known, and which he assumed out of compliment to his master, Andrea Contucci da Monte Sansovino. Contucci had just returned from Portugal, where he had acquired great reputation as a sculptor, when Jacopo, who was then twenty-one years of age, became his pupil, and afterwards greatly surpassed him. His superior talent however was so far from exciting any jealousy, that it served only to increase his instructor's attachment to him. At this time Jacopo profited greatly by his intimacy with Andrea del Sarto. They almost pursued their studies in common, and both of them copied Michel Angelo's celebrated cartoon representing an episode of the war with Pisa. Becoming acquainted with Giuliano Sangallo, then architect to Julius II., he was taken by him to Rome, where his talents procured for him the notice of Bramante and other eminent artists, and also of the pope himself. He was probably indebted to Sangallo for his first instruction in architecture—an art which he did not begin to practise till some years afterwards, but in which he ultimately attained the highest distinction. On his return to Florence he produced his *Bacchus*, a chef-d'œuvre in modern sculpture, but now known only from drawings and copies, it having been destroyed by a fire that broke out (1762) in the gallery at Florence, where it had been placed. During his residence at this period at Florence he had an opportunity of displaying his talents as an architect, in designing several triumphal arches, and decorating the front of the Duomo with a temporary façade adorned with Corinthian columns, niches, reliefs, &c., in honour of the public entry of Leo X. (1515), who complimented him by saying that the design deserved to be perpetuated in marble.

Sansovino returned to Rome a second time, but quitted it for ever on the city being taken and sacked by the imperial troops in 1527, and retired to Venice. He was not however entirely a stranger in that city, having visited it shortly before, when he was introduced to the doge, Andrea Gritti, whose patronage was of essential service to him. One of the first works he was employed upon was the repairing the domes of St. Mark's; after which he executed a great number of structures, both for the republic and private individuals, among which are San Giorgio de' Greci, La Scuola della Misericordia, the Palazzo Cornaro à San Maurizio (one of his best works), San Francesco della Vigna, La Zecca or Mint, the Public Library, the Loggia del Campanile, San Geminiano (now taken down), Palazzo Delfino, Fabbriche Nuove di Rialto, &c. Among these the Zecca is considered one of his finest works, yet it certainly is deficient in character, and the windows are too large and too numerous. Inconsistencies of a different kind occur in the Loggia del Campanile, a highly ornamental piece of architecture; for while the sculptures on the exterior represent heathen deities, the Virgin Mary occupies the niche within. Still this incongruity is excusable in comparison with that exhibited by him in a magnificent bronze door in the sacristy of St. Mark's, the two principal compartments of which represent the Saviour's death and resurrection, while the smaller panels are decorated with the heads of the evangelists, besides those of some of his own friends, including that of Peter Aretin. His professional reputation was at one time in great jeopardy, for scarcely was the vaulted ceiling of the Public Library completed, when it fell down; in consequence of which he was imprisoned and fined, though shortly after liberated and restored to his former office. Notwithstanding his numerous engagements as an architect, he did not give up sculpture entirely, but he executed the two colossal figures of Mars and Neptune, which adorn what is from them called the Giants' Staircase in the ducal palace, when upwards of seventy-five years of age. He died at the age of ninety-one, November 27, 1578. According to Vasari, he enjoyed unimpaired health and strength to the last. As a sculptor, he formed many excellent scholars, and among others Danese Cataneo and Alessandro Vittoria.

**FRANCESCO SANSOVINO**, a son of Jacopo, supposed to have been illegitimate, was born at Rome in 1521. He was educated to the law, took his degree at Padua, and began to practise at the bar in Venice, but with so little success that he resolved to try his fortune some other way at the court of Rome; Cardinal di Monte, his godfather, having been elected pope (Julius III.) in 1550. Yet although he was kindly received by the pontiff and made one of his chamberlains, he was so disappointed in the chimerical expectations he had formed, that he returned to Venice, where he thenceforth applied himself entirely to literature. The number of his productions, among which

are several translations from the classics, histories, and historical collections, abridgments, &c., attest his industry; but the works by which he is now chiefly remembered are his 'Description of Venice,' and the 'Cento Novelle scelti de' piu nobili Scrittori della Lingua Volgare,' which last has been frequently reprinted, but though the later editions have been augmented by a hundred additional tales, they are less esteemed than those of 1565 and 1566. Francesco died at Venice, on the 28th of September 1583.

**\*SANTA-ANNA, ANTONIO LOPEZ, DE**, the late President of Mexico, was born in Mexico within the last ten years of the 18th century. He first distinguished himself in 1821, in assisting to expel the Spanish royalists from Vera Cruz, of which town and district he became governor, but was deposed in November 1822. He then organised a movement in that province in favour of a republic, commenced hostilities against Iturbide who had proclaimed himself emperor, and ultimately succeeded in overthrowing him. His success however not satisfying his ambitious views, he placed himself at the head of the Federalist party, was defeated, and withdrew for a time to his estate of Jalapa. In 1828, on Pedrazza being elected to the office of president, he took the field as the supporter of Guerrero, the rival of Pedrazza, and Guerrero, on attaining the dignity of president, made Santa-Anna the commander of his forces. In 1830 Bustamante was chosen president, when Santa-Anna, in 1832, headed an insurrection in favour of Pedrazza, whom he had formerly opposed, defeated the army sent against him, and Pedrazza was president till April 1833, when Santa-Anna was himself nominated president. In this position, his vacillating conduct towards all parties encouraged the aristocratic section, and though a favourite with the army, who desired to proclaim him dictator, he became unpopular with the nation, and Arista and D'Arran rose in arms against him, but were soon subdued. A suspicion arose however that he was aiming at the imperial dignity, and in March 1835 a new insurrection broke out in four of the provinces, and a proclamation was issued in Texas against his government. The defeat of these reformers, as they styled themselves, in Zacatecas, enabled Santa-Anna to attain the object of his ambition, and he proclaimed himself Dictator. He did not enjoy the dignity in peace, for his opponents concentrated themselves in Texas, and towards the end of 1835 raised anew the standard of revolt. His efforts to suppress them were unsuccessful, and ended in his being taken prisoner at San Jacinto in 1836. He was liberated in 1837, and in 1838 took part in the defence of Vera Cruz against the French, on which occasion he lost a leg. After various changes of fortune, he was again elected president in 1841, and ruled till 1845, when a new revolution deprived him of his post, and he was taken prisoner near Tlacolula, Jan. 15, banished for ten years, and embarked for England in the Medway in April. The two succeeding presidents however, Herrera and Paredes, found it impossible to consolidate their power; and the war commenced against them by the United States, who had resolved to support the independence claimed by Texas, induced the nation to depose Paredes and to recall Santa-Anna to the presidency. In February 1846 he met the American army under General Taylor at Buena Vista, where, after a conflict of two days, he was forced to retire. The Mexican army was defeated again at Matamoros on the 22nd of August. The city of Mexico fell into the hands of the enemy in August, and Texas joined the Union. The Mexican senate deposed Santa-Anna in his absence; but he refused to obey, and retired with the remains of his army to Tehuacan, whence in the following year he was recalled to the supreme command, and on the 18th of February 1847 the forts and batteries of Cerro Gordo were attacked and taken by the Americans, when Santa-Anna fled, leaving 6000 prisoners in the hands of his adversaries. D'Arran was elected president, and the successes of the United States forces rendering the danger of Mexico imminent, a peace was signed with that power February 2nd, 1848, purchased by the acknowledgment of the independence of Texas and the cession of California. General Arista succeeded D'Arran, but in September 1852 Santa-Anna was recalled, who exercised his power in a despotic manner. In 1853 he propounded a new constitution; and by a resolution of the council, founded upon the votes of various authorities, of the corporations, and of the most influential inhabitants, he was declared president for life, with the power of naming his successor. In January 1855 these resolutions were confirmed by a nearly unanimous vote of all citizens having the right of voting; but in August of the same year the feeling against him became so strong that he left the capital, and at Perote signed his unconditional abdication. General Carrera, who had led the insurrection, was then president for six months; he abdicated in favour of General Juan Alvarez, who also abdicated on the 10th of December, and was replaced by General Comonfort, the present president. At the present time however (May 1857) a re-action is said to be taking place in favour of Santa-Anna.

**SANZ, AUGUSTIN**, a Spanish architect, was born at Saragossa, December 29, 1724. He studied the practical part of his profession under Raymundo Cortès, surveyor-general of the public buildings in that city, and the theoretical part in the school of design established there by the sculptor Ramirez at his own expense. But for the progress he afterwards made, and the taste he displayed, he was chiefly indebted to the instruction and advice of Ventura Rodriguez [Rodriguez], when the latter was engaged at Saragossa on the chapel del

Pilar. In 1775, he was elected a member of the Academy of St. Ferdinand, and when the school instituted by Goicoechea was made an academy by the title of that of San Luis, in 1792, Sanz was appointed director, having previously given instruction in architecture there without any emolument. In his capacity of public teacher he did much towards eradicating the prejudices and corrupt taste of the preceding period, when the art was in a very degraded state in Spain; and towards introducing a better style. Nor was his influence inconsiderable, as the government appointed him to inspect all designs for public buildings proposed to be erected in Aragon. Among those erected by himself the principal are, the church of Santa Cruz, Saragossa (of the Corinthian order, and forming a Greek cross in its plan), and those at Urrea and Binaces, both of them built at the expense of the Duke de Híjar. He also designed the theatre and some other public edifices at Saragossa, besides a number of private houses. He died July 25, 1801, and left a son, Martias Sanz, who was also an architect, and who completed the façade of the church at Epila, which building had been begun by his father.

SAPPHO was a native of the island of Lesbos, though the exact place is uncertain, for according to some she was born in Eressus, and according to others in Mitylene. The time of her birth is also unknown, and there are few events of her life which can exactly be ascertained. Her own fragments, as well as those of Alcæus, show that these two greatest poets of the Æolic school were contemporaries, though Sappho must have been younger than Alcæus, for she was still alive in B.C. 568, as may be inferred from the ode that she addressed to her brother Charaxus, in which she reproached him for having purchased Rhodopis, the courtesan, from her master, and having been induced by his love for her to emancipate her. (Herod., ii. 135; Athen., xiii. p. 569.) Charaxus bought Rhodopis at Naucratis in Egypt, and in all probability not before the reign of Amasis, who ascended the throne in B.C. 569. Before this time, and when she was still in full possession of her beauty, she is said to have left her country for Sicily, but the cause of this flight is unknown. (Marm. Par., 'Ep. 36; Ovid, 'Heroid.,' xv. 51.) It was formerly a common belief that Sappho destroyed herself by leaping into the sea from the Leucadian rock, in despair at her love being unrequited by a youth named Phaon. It is true that in her odes she frequently mentioned a youth whom she loved, who did not return her love, but there is no trace of the name of Phaon in any of her poems; and if the name did occur, it was probably the name of Adonis, the favourite of Venus, who was in some legends called Phaon or Phæton. It is therefore not unlikely that the manner in which she described Venus addressing Phaon may have given rise to the story of her own passionate love for Phaon. The story of her "leap from the Leucadian rock" is likewise, as K. O. Müller and others have shown, a mere fiction which arose from a figurative poetical expression, for the phrase appears to have been used by some poets to express a violent love from which relief is sought by a leap from the Leucadian rock into the sea. It is not expressly stated by any of the ancients who tell the story, whether Sappho terminated her life by the leap or whether she survived it.

The genuine sources of information as to Sappho are the fragments of her own poems and some of Alcæus, and in reading them it should not be forgotten that Sappho belonged to the Æolian race, which at the time when the state of society in Attica had assumed a totally different aspect from that of the Heroic age, still retained much of the simplicity of ancient Greek manners. At Athens women lived in the strictest seclusion, and the free intercourse of women of ability, such as Sappho and her numerous friends, would lead to the opinion among Athenians that she led an immoral life. It is now superfluous to vindicate the personal character of Sappho, for this has been satisfactorily performed by F. G. Welcker, in a little work called 'Sappho von einem herrschenden Vorurtheil befreit,' Göttingen, 1816.

With the exception of one complete ode and a considerable number of short fragments, the poems of Sappho have perished; but what we possess is sufficient to justify the admiration of the ancients. In warmth and purity of feeling, in grace and sweetness, and in delicacy and beauty of diction, she has perhaps never been excelled by any lyric poet either of ancient or modern times. The loss of her works is perhaps as much to be lamented as that of any other ancient author whose writings have perished, for besides the pleasure that might have been derived from them as works of art, they would undoubtedly have thrown much light on the condition and social relations of women in some parts of Greece, a subject now involved in great obscurity. The ancients divided her poems into nine books, which consisted of erotic odes, epithalamia, hymns to the gods, and other poems. The rhythmical construction of her odes was essentially the same as that of Alcæus, though with many variations, and in harmony with the softer character of her poetry. There is a verse called the Sapphic verse, which derives its name from the Greek poetess, and which she is said to have invented. The verse is as follows:—

— — — — — / — — — — —

The Sapphic strophe consists of three Sapphic verses followed by a versus Adonicus. It has been frequently imitated by poets of ancient as well as modern times.

The fragments of the poems of Sappho are generally printed

together with the poems ascribed to Anacreon. The best separate editions are: 'Sappho Lesbica; Carmina et Fragmenta, rec. comment. illustr. schemata musica adj., &c. H. F. M. Volger,' Lipsiæ, 8vo, 1810; Sappho, 'Fragm. Specimen Operæ in omnibus artis Græcorum Lyricæ reliquiis, &c., proposuit C. F. Neue,' Berlin, 4to, 1827. The best German translation is by K. L. Kannegiesser, Berlin, 1827.

(Müller, *Hist. of Greek Lit.*, i. p. 172-180; Bode, *Geschichte der Hellenischen Dichtkunst*, vol. ii. pt. 2, p. 411, &c.)

SARDANAPALUS is the name by which the Greek and Roman writers designate the last king of Assyria. They state that he was a wealthy and powerful king, and built two towns, Anchiale and Tarsus, in one day. (Steph. Byz., v. Ἀγκιάλη; Suidas, v. Σαρδανάπαλος; Herod., ii. 150.) But he was a man of voluptuous habits, and spent his life in his palace at Ninus or Ninive, surrounded by women. The mode in which he ended his life, at the time when his kingdom fell into the hands of the Medes, is told by Diodorus Siculus (ii. 24-27) and Justin (i. 3). Arbaces, who was his satrap in Media, one day with great difficulty obtained admission to his master, and to his astonishment found him engaged in his usual unmanly occupations among his concubines. Filled with indignation, Arbaces on his return declared to his friends that he could no longer obey such a king. A conspiracy was formed, and Arbaces, with his Medes, joined by Belesys, a Babylonian priest (probably a Chaldean), marched against Ninive (comp. Herod., i. 96). Sardanapalus at first endeavoured to conceal himself; according to others, he marched out to meet the rebels, and was successful in three battles; and then, thinking himself safe, he gave himself up to his usual pleasures, and prepared a grand feast for his army. Arbaces however in the meantime surprised the king's camp, routed the enemy, and drove the king with a few followers back to his capital. Here Sardanapalus maintained himself for two years, though deserted by all the provinces, and when at last he saw that further resistance was useless, he caused a pyre to be raised on which he burnt himself with all his treasures and his women. Assyria thus fell into the hands of the Medes, who united it with Media. The time of this event is differently assigned; some suppose that it took place about 880, some again place it in the year 717, and others in B.C. 606. The name of King Sardanapalus, both in ancient and in modern times, has been used proverbially to express the highest degree of voluptuousness and effeminacy.

The above is the old popular account of Sardanapalus. Of late years owing to the difficulties in the statement of Ctesias, as given by Diodorus, some writers have regarded the entire account as a myth, and Sardanapalus as a fabulous personage—(K. O. Müller, for instance, has sought in an elaborate essay, 'Sandon und Sardanapal,' to identify him with the god Sandon)—but his name is believed to have been deciphered in the cuneiform inscriptions, and the annals of his reign to have been recovered from several independent texts at Nimrud. These texts are in great detail, occupying some thousands of lines, but they differ widely as to the events of his reign. An Assyrian king is recorded to have perished in some great combustion, but it does not appear to have been Sardanapalus. His annals, with many others, the trustees of the British Museum propose to publish under the care of Sir Henry Rawlinson and Mr. Edwin Norris. It may be added that among the Assyrian remains sent within the last year or two to this country by Sir Henry Rawlinson and now in the British Museum, are fragments of a throne, which Sir Henry supposes to be that of Sardanapalus, and which certainly was the throne of the kings of Assyria.

SARTI, GIUSEPPE, a composer, once in high repute, and whose name is still too familiar to the readers of musical history to be omitted here—though his works, like most that are written to suit the fashion of the day, are, with the exception of a sacred terzetto, consigned to oblivion—was born in 1730, at Faenza. In 1756 he became Maestro di Capella at the court of Copenhagen: he afterwards composed for the court of Dresden; and finally entered into the service of Catherine of Russia, who treated him with a liberality truly imperial, at whose demise he was continued in all his appointments and emoluments by Paul, her successor. His chef-d'œuvre, 'Giulio Sabino,' an opera, which was extravagantly applauded abroad, and is highly spoken of by Dr. Burney, did not succeed in London; indeed the neglect into which it speedily fell here, and, in time, everywhere else, may be adduced as a proof of its inherent weakness, and of the want of that power in the composer which is apparent in most of his works that are known to us. Sarti produced about thirty operas, and some sacred music. Of the latter, the terzetto alluded to above, 'Amplius lava me,' is deservedly admired. He died at Berlin, in 1802.

SARTO, ANDREA VANUCCHI, called del Sarto, from the occupation of his father, who was a tailor, was born at Florence in 1488, and having shown an early predilection for drawing, was placed with a goldsmith to learn the business of engraving on plate. Being noticed by Giovanni Barile, a painter of no great celebrity, he persuaded his father to entrust his son to his care. With him young Sarto remained three years, and manifested such extraordinary talent that Barile placed him with Pietro Cosimo, who was considered one of the best painters in Italy. On leaving the school of Cosimo he formed an intimacy with Francesco Bigio, with whom he executed some works in the public buildings of Florence, which gained him considerable reputation. Lanzi observes that his improvement was not so rapid as that of many other artists, but slow and gradual. It

has been erroneously asserted that he never was at Rome, but we are assured by Vasari that he passed some time in that city. We are informed that it was after his return from Rome that he painted for the monastery of the Salvi his admired pictures of the 'Descent of the Holy Ghost,' the 'Birth of the Virgin,' and the 'Last Supper.' Of the last, Lanzi reports, that at the siege of Florence in 1529, the soldiers having destroyed the church and part of the convent, when they entered the refectory, stood motionless before it, and had not the heart to demolish it. Francis I., king of France, desirous to procure specimens of the works of the most distinguished painters in Italy, Andrea del Sarto was commissioned to paint a picture for his majesty, and sent in a 'Dead Christ,' with the Virgin, St. John, and other figures, painted in his best manner, which is now one of the chief ornaments of the Gallery of the Louvre. This picture being universally admired, the king invited the artist to Paris, where he was received with great distinction, and obtained considerable employment both from Francis and the nobility. Amidst this success he received a letter from his wife, urging him to return to Florence. He accordingly requested leave of absence for a few months, promising to return with his family and settle in France. The king granted his petition; and not only made him liberal presents, but entrusted him with large sums of money for the purchase of statues, pictures, and drawings. Andrea however on returning to Florence, squandered away the whole of the king's money as well as his own. At last he was reduced to poverty; and his conscience reproaching him with his ingratitude to his royal benefactor, he sunk into despondency, was abandoned by his wife and the false friends with whom he had spent his property, and at last his afflictions were ended by the plague, which carried him off in 1530, in the forty-second year of his age.

The churches, convents, and palaces of Florence contain many of his best works. Andrea is praised by Vasari as the prince of the Tuscan school, for having committed fewer faults than any other Florentine painter.

His colouring is distinguished by sweetness and harmony of tone; and he is remarkable for the boldness of his relief and his perfect knowledge of chiaroscuro. His draperies are easy and graceful, and his design extremely correct; but he wanted the grandeur which characterises the greatest masters.

**SATURNINUS**, a name of several Roman jurists.

**CLAUDIUS SATURNINUS** is the name of a Roman to whom two Rescripts of Antoninus Pius are addressed ('Dig.' 20, tit. 3, s. 1, § 2; 50, tit. 7, s. 4); and a person of the same name was prætor under the Divi Fratres, the successors of Pius. He is generally considered to be the author of a work in a single book, 'De Pœnis Paganorum,' which in the Florentine Index is attributed to Venuleius Saturninus. There is a single excerpt from this work in the 'Digest' (43, tit. 19, s. 16).

**QUINTUS SATURNINUS** is cited in the 'Digest' (34, tit. 2, s. 19, § 7) as the author of a work 'Ad Edictum,' in ten books at least. Whether he is the same as Claudius or Venuleius, or is a third person, is uncertain.

**VENULEIUS SATURNINUS**, a Roman jurist, who is simply called Venuleius in the Florentine Index, though in the titles of the excerpts in the 'Digest' he is often called Venuleius Saturninus. Lampridius ('Alexander Severus,' 68) says that he lived under Alexander Severus, but there is some doubt about his period. His writings mentioned in the Florentine Index are—Ten Books of Actiones, Six of Interdicta, Four on the Office of Proconsul, Three on Publica Judicia, and Nineteen of Stipulationes. The book 'De Pœnis Paganorum' has been already mentioned.

(Grotius, *Vita Jurisconsultorum*; Zimmern, *Geschichte des Röm. Privatrechts*, pp. 354, 379.)

**SAUL**, the first king of the Hebrews, was the son of Kish, apparently an influential man of the tribe of Benjamin. While wandering to find his father's asses he had recourse to Samuel for advice, was by him anointed king, and was subsequently elected by the people at Gilgal in B.C. 1110. Saul at the time is supposed to have been about forty years of age, and in stature much exceeding his fellows. He appears to have possessed a character like that of many of the oriental sovereigns; he was brave, energetic, occasionally generous, fond of magnificence, and highly ambitious, with very little of reverence for the priestly institutions of his country, no feeling of true religion, and much self-will. These qualities quickly displayed themselves. The Ammonites attacked him, and laid siege to Jabesh; but Saul rapidly summoned his forces, attacked the camp of the Ammonites, defeated, and dispersed them. He would not however consent to the expressed wish of his army that those who had opposed his elevation should be now put to death, and the people were satisfied by confirming his election. Saul's authority was now fully established, and one of his earliest acts was to embody a guard, of whom he kept 2000 with himself in Michmash and Mount Bethel; and placed the other 1000 under Jonathan, his son, in Gibeah, who with them attacked the Philistines in Geba. This occasioned the Philistines to collect a large host, before whom the Israelites fled affrighted, hiding themselves in thickets and in rocks, for they had been so completely disarmed that only Saul and Jonathan had spear or sword, and "there was no smith found throughout all the land." It was when about to oppose this host that Saul superseded Samuel in offering sacrifice. [SAMUEL.] Jonathan however, relying on divine aid, obtained a victory over it;

but Saul again, without waiting for the reply of the priest, engaged in the contest, and interdicted the army from tasting anything until evening, that he might be avenged of his enemies. Jonathan unawares transgressed, and his father, attributing the delay of the priest's answer to his son's sin, sentenced him to death; but "the people rescued Jonathan, so that he died not." For six or seven years Saul continued to make war successfully against the surrounding nations, acquiring glory, and extending his power. At length, in the eleventh year of his reign, he was commissioned to destroy the Amalekites. He led his army against them, and captured their king Agag, with all their riches. These he brought to Gilgal, where Samuel met him, and where Agag was slain. [SAMUEL.] After the consecration of David the history of that king comprises all the important events of Saul's reign [DAVID] until his death, which happened in a battle with the Philistines, where himself and three of his sons, Jonathan, Abinadab, and Melchishua were slain in B.C. 1056.

**SAUMASE, CLAUDE**, [SALMASIUS.]

**SAUNDERSON, DR. NICHOLAS**, an English scholar, particularly distinguished by the extent of his acquirements in classical learning and mathematics, under the disadvantageous circumstance of having become blind from the small-pox at the age of twelve months.

He was born in 1682, at Thurleston in Yorkshire, where his father held an appointment in the Excise; and at an early age he attended the free-school at Penniston, where he was taught the rudiments of the Latin and Greek languages. It is not stated by what means the youth obtained a knowledge of the forms of letters or numbers; and probably the first instruction which he received in literature and science was conveyed to his mind by oral information only.

The elder Saunderson appears to have very soon observed the predilection of his son for mathematical subjects, and though burdened with the duties of his appointment and the cares attending a numerous family, he laboured diligently to make him acquainted with all the science which it was in his power to communicate. This consisted merely of the first elements of numbers; and low as these may be in the scale of knowledge, it will be readily conceived that the anxious parent must have had an arduous task to perform in enabling a pupil bereaved of sight to understand the combinations which enter even into the rules of common arithmetic. The benevolence of Mr. Richard West of Underbank and Dr. Nettleton came however in furtherance of the father's efforts; and these gentlemen perceiving the remarkable talent of the youth, then about eighteen years of age, zealously exerted themselves to communicate to him instruction in algebra and geometry. By the kindness of his friends, young Saunderson was also enabled to spend some time in the prosecution of his studies at an academy near Sheffield. From this time his progress became rapid. By the help of a retentive memory he succeeded in resolving the questions usually given as exercises in elementary works, and by the power of his genius he discovered methods of investigating propositions of considerable intricacy. His application to mathematics did not however prevent him from continuing to cultivate the study of classical literature; and it is stated that, besides making himself familiar with Cicero, Virgil, and Horace, he became enabled to understand the works of Euclid, Archimedes, and Diophantus, when read to him in the original Greek.

Mr. Saunderson having decided on making an effort to establish himself at Cambridge as a teacher, went to that university in 1707. He resided in Christ's College, and immediately commenced a series of lectures on the Universal Arithmetic, the Optics, and the Principia of Newton. At this time, Mr. Whiston, the Lucasian professor of mathematics, was engaged in the delivery of lectures on the same subjects; and it is honourable to the benevolence of this gentleman, that he readily consented, at the request of the friends of the blind youth, that the latter should labour in the same field. The peculiar circumstances under which Saunderson taught, and his great talents, procured for him many pupils, and were the means of bringing him into a correspondence with Sir Isaac Newton, and to an intimacy with the other great mathematicians of that time. When Whiston was removed from his chair, in 1711, Queen Anne, at the recommendation of Sir Isaac, was induced to confer on Mr. Saunderson the degree of M.A., in order that he might become qualified to hold the place which had become vacant by the retirement of his friend. Saunderson, on being appointed, pronounced an inaugural discourse in Latin, and from that time devoted himself wholly to his professional duties. In 1723 he married a daughter of the Rev. Mr. Dickens, rector of Coxworth; and in 1723, when the king, George II., visited the university, he was, by the royal authority, made Doctor in Laws.

Dr. Saunderson continued to enjoy good health till near the end of his life. He died on the 19th of April 1739.

This extraordinary man composed, in writing, for the use of his pupils, several lectures on different subjects in natural philosophy, but they were never prepared, nor perhaps intended for publication. A valuable treatise which he had composed on the elements of algebra, appeared at Cambridge in two vols. 4to, in 1740; and another on fluxions in 8vo, including a commentary on some parts of Newton's 'Principia,' came out in the year 1756.

In order to perform arithmetical computations, Saunderson used a square board divided by lines at one-tenth of an inch asunder, and parallel to the sides, into many small squares, each of which was

pierced with nine holes in three parallel rows. Small pins were placed by the hand in these holes, and the value of a digit was indicated by the particular hole, in each square, in which the pin was placed. A pin with a large head placed in the centre hole denoted zero, and one with a small head in the same hole indicated unity. A large-headed pin in the centre, with a small-headed pin in the first hole of the first row, expressed the number 2; a large-headed pin in the centre, with a small-headed pin in the second hole of the first row, expressed the number 3; and so on. The process is described in the first volume of the 'Elements of Algebra,' and it is evident that by such means any number may be easily expressed, and any arithmetical operation performed. He used the same machine for representing geometrical diagrams: the pins being placed at the angles of the figure, and connected by threads which indicated the lines.

His ideas of the forms which plane or solid figures would assume when viewed by an eye placed in a given position, were remarkably correct and distinct; and we are informed by Dr. Reid ('Inquiry into the Human Mind,' ch. 6), that he understood the rules of perspective and the projections of the sphere. But the mental process by which he acquired this kind of information was probably peculiar to himself; for Dr. Reid states that once in conversation, Saunderson acknowledged that he had found great difficulty in understanding Dr. Halley's demonstration, that the angle made by two circles of the sphere was equal to the angle made by their projections on a plane, adding that when he considered the proposition in his own way he became aware of its truth.

Dr. Saunderson possessed in a high degree the senses of feeling and hearing. It is said that he could distinguish true from counterfeit Roman medals by the different degrees of their smoothness; and on one occasion, when some students were taking the sun's altitude in the garden of Christ's College, he could tell, by some effect of the air upon his person, when very light clouds were passing over the disc of the luminary. When he entered a room he could judge of its magnitude and of his distance from the walls by the sound of his footsteps. In his youth he had learned to play on the flute, and it is said that he succeeded so well as to give room to suppose that if he had applied himself to music he might have excelled in it to as great a degree as in mathematics.

Saunderson is described as having been extremely passionate. He was imbued with a strong sense of the importance of truth, but he too often expressed his sentiments with a freedom which caused him to have many enemies. It may be said that he was better qualified to inspire admiration than to make or preserve friends. He is accused moreover of having been decidedly a sceptic in matters concerning religion.

SAURIN, JAMES, an eminent French Protestant divine, was born at Nîmes, January 6, 1677. He was the son of a lawyer, of the same persuasion, who quitted France upon the revocation of the Edict of Nantes, and retired apparently to Geneva. At least it is known that James Saurin finished his education there, after having borne arms for a short time in the English service. In 1701 we find him pastor of the Walloon church in London, whence, after four years, he repaired to Holland, and establishing himself at the Hague, remained there in the exercise of the ministry until his death, December 30, 1730. That event is said to have been hastened by mortification at the disputes and ecclesiastical censures in which he was involved by his 'Dissertation sur le Mensonge Officieux,' on falsehoods which are expedient, a delicate subject to handle.

As a preacher he is ranked at the head of the French Protestants. "Depth of thought, force of argument, skillful connection of parts, strength of drawing, bursts of pathos, original turns, points which strike the imagination and move the heart, majestic and imposing simplicity like that of the Scriptures, are the characteristics of his eloquence." Such is the criticism of a French biographer.

He published five volumes of sermons, to which seven volumes were added after his death: the first portion is reputed the best. His other chief works are, 'On the State of Christianity in France,' and 'Discourses, historical, theological, and moral, on the principal events of the Old and New Testaments,' 2 vols. fol. (known as Saurin's Bible), to which four volumes by other hands were added after his death. In these is contained the 'Dissertation on Falsehood' above noticed. Six volumes of his sermons have been translated into English.

SAURIN, JOSEPH, a French mathematician and natural philosopher, was born in 1659, in the South of France, at Courtaison in the principality of Orange, (now the department of Vaucluse) where his father was the minister of a Protestant congregation. The young man was educated in the principles of the Reformed Church, and before he was twenty-four years of age he was called to the ministry at Eure in Dauphiné. Possessing an ardent temperament and a bold eloquence, he soon distinguished himself as a preacher; but, in one of his sermons, happening to censure too freely the measures taken by government for diminishing the privileges of the Protestants, he was obliged to retire into the canton of Bern, where he obtained the curacy of Berchier in the bailliage of Yverdon. Certain circumstances, which had been differently related by his friends and enemies, obliged him soon afterwards to take refuge in France, where, in 1690, he abjured the doctrines of the Calvinists. His own account is, that having refused to sign the 'Consensus' of Geneva, condemning the doctrines

of the French Protestant theologians respecting original sin and the vowel points of the Hebrew text, he was vehemently censured by a party in the Church. He adds that the harsh treatment to which he was subjected on this account led him to suspect the sincerity of his adversaries' sentiments in religion; and that an attentive study of the works of the celebrated Bossuet convinced him of the errors of Protestantism. On the other hand it is stated that Saurin, having been guilty of theft, withdrew to France in order to avoid the prosecution with which he was threatened: this accusation, true or false, is founded on a confession which he is said to have made in a letter dated 1689, and printed in the 'Mercure Suisse,' and upon some documents relating to the criminal process instituted on the occasion, which are stated to have been preserved in the Chancery of Bern.

After his recantation, having, through the interest of Bossuet obtained a pension from the king (Louis XIV.), Saurin devoted himself to the study of the mathematical sciences; and between 1702 and 1708 he wrote several papers which were published in the 'Journal des Savans.' At the same time he was engaged in a controversy with Huyghens on the subject of the vortices of Descartes, and with Rolle concerning the infinitesimal calculus. He became a member of the Académie des Sciences in 1707, and between 1709 and 1727 he enriched its 'Mémoires' with numerous mathematical and philosophical papers, among which are some containing profound investigations relating to the curves of swiftest descent, and dissertations, conformably to the Cartesian hypothesis, on the force of gravity.

Saurin's scientific pursuits were interrupted for a time by the imprisonment which he suffered in consequence of an accusation brought against him by J. Baptiste Rousseau, that he was the author of certain profane and defamatory verses, with the composition of which Rousseau himself had been charged. As the accusation could not be substantiated, the judgment of the court was given against the accuser, who, in consequence, was banished from France, while the accused was liberated. [ROUSSEAU, J. B.]

Saurin died December 29, 1737, of a lethargic fever. He appears to have been a man of vigorous mind, but it is said that he was capable of using any means for obtaining the ends which he had in view; and it must be observed, that the cause of his departure from Switzerland, and the abjuration of his first religious opinions, have never been satisfactorily explained.

SAURIN, ELIAS, brother of Joseph, was a divine of some note among French Protestants; he was no relation apparently to James Saurin, but like him he settled in Holland: he was born in 1639, and died in 1703.

SAUSMAREZ, JAMES, LORD DE, was born at St. Peter Port, in the island of Guernsey, on the 11th of March 1757. His family name, De Sausmarez, bears evidence of Norman extraction, and mention of it is to be found in the earliest records of the Channel Islands. From early youth he manifested a strong inclination for the naval service, in which several members of his family had distinguished themselves. When thirteen years of age he entered as a midshipman on board the Montreal, and afterwards served in the Winchelsea and Levant frigates, under the respective commands of Admirals Goodall and Thompson. On his return to England in 1775, he joined the Bristol, of 60 guns, under the command of Sir Peter Parker, and was present at the attack on Charlestown, in America: the courage he displayed on that occasion was rewarded by promotion to the rank of lieutenant. From that period to 1779 he was actively employed in America, and was enabled to render considerable service to the expedition under Lord Cornwallis. He was afterwards appointed second-lieutenant to the Fortitude, Admiral Sir Hyde Parker, and he was in the engagement which took place with the Dutch fleet under Admiral Zoutman, off the Dogger Bank, on the 5th of August 1781. His behaviour in this action, in which he was wounded, caused him to be promoted to the rank of commander, and appointed to the Tisiphone fire-ship.

In the month of December following Captain Sausmarez was ordered to place himself under the command of Admiral Kempenfeldt, who, with twelve sail of the line, was commissioned to intercept the French fleet, commanded by the Comte de Guichen, and which was destined to assist the Comte de Grasse in the capture of Jamaica. To inform Sir Samuel Hood, the English Admiral in the West Indies, of the sailing of this fleet, became a matter of the highest importance, and Captain Sausmarez was selected for this service. While at Jamaica he was enabled, through an exchange, to obtain post-rank and the command of the Russell, a ship of the line. In this ship he greatly distinguished himself at the memorable battle of the 12th of April 1782. [HOOD, SAMUEL, VISCOUNT; RODNEY, ADMIRAL.] On the 29th of July following, he returned in the Russell to England, and from thence to his native island, where he enjoyed in the society of his friends the peace which was soon after proclaimed. On the breaking out of the war of the French revolution (January 1793), Captain Sausmarez was appointed to the command of the Crescent, of 36 guns. In this frigate he captured off Cherbourg, after a warm action of nearly two hours and a half, the French frigate La Réunion, of 36 guns, but of larger size and with a much more numerous crew. Though the French had 120 men killed and wounded, the Crescent had only one man wounded, and that by the recoil of a gun. The success of this action procured for him the honour of knighthood, and

he was presented by the merchants of London with a valuable piece of plate. In the month of November following, Sir James Sausmarez was placed under the orders of Admiral Macbride, who gave him the command of a squadron consisting of the *Crescent* and *Druid* frigates, a brig, and a cutter, destined to assist the attempts made by the French royalists to join the rising of the Vendéans. On the 5th of June 1794, an opportunity was presented him of displaying his skill and intrepidity: while proceeding from Plymouth to Guernsey with the *Crescent*, *Druid*, and *Eurydice* frigates, he was attacked by a French squadron of more than double his force. A running fight ensued, the brunt of which was borne by the *Crescent* and the *Druid*, to cover the escape of the *Eurydice*, which, on account of its inferior sailing, ran considerable risk of being captured. This object being effected, he closed in with the enemy in the *Crescent*, and thus enabled the *Druid* also to take refuge into the roads of Guernsey. He effected the escape of the *Crescent* by his cool intrepidity and a perfect knowledge of the difficult coast in which he was engaged. As soon as the other ships were secure, he bore up as if to run the *Crescent* on the rocks to avoid being taken, ordering the pilot, a native of Guernsey, to steer through a narrow passage between the rocks, which had never before been attempted by a ship of her size; he thus reached in safety an anchorage where he was able to defy every effort of the enemy to take his vessel.

In March 1795, Sir James was appointed to the *Orion*, 74, and placed under the orders of Lord Bridport, in which ship he opened the memorable battle which took place on the 23rd of June. In 1797 the *Orion* was attached to the squadron sent to reinforce the fleet of Sir John Jervis off Cape St. Vincent, and took a prominent part in the glorious engagement with the Spanish fleet. [JERVIS, JOHN.] He was after this battle employed till the end of April 1798, in the blockade of Cadiz, and then selected by Lord St. Vincent to join the squadron under Sir Horatio Nelson destined to watch the operations of the French armament at Toulon. At the important victory of the Nile, Sir James, as senior captain, was the second in command, and his ship was the third which entered into action; the courage which he displayed on this occasion was enhanced by his humane endeavours to save the remnants of the unfortunate crew of the *Orient*. [NELSON, HORATIO.] A wound which he received during the action was so severe as to prevent his leaving the *Orion*, after the victory, to present his congratulations to Lord Nelson. Shortly after his return to England, on the 14th of February 1799, Sir James Sausmarez was promoted to one of the vacant colonelcies of marines, and to the command of the *Cæsar*, of 84 guns, in which he sailed with a detachment of the Channel fleet, under Sir Alan Gardner, to bring home from Lisbon the ships captured at the battle of the Nile. During the winters of 1799 and 1800 he was entrusted with the command of the squadron which was commissioned to watch the French fleet in Brest. The difficulties to be encountered in this arduous service, particularly during the winter season, were very great; and it is no small praise to the careful vigilance of this commander to remark, that, during the whole time he remained on that station, not a single vessel sailed from or entered the port of Brest.

At the commencement of the year 1801 he was promoted to the rank of rear-admiral of the blue, and in the month of June following was appointed to the command of a squadron to watch the movements of the Spanish fleet at Cadiz. On this occasion he was created a baronet. On his arrival at Cadiz information was given him that three French line-of-battle ships and a frigate were in the bay of Algeiras, and he immediately determined upon attacking them. The position of the French was one of great strength, defended by the batteries in the bay and fourteen large gun-boats. The action commenced on the morning of the 6th of July, in which he had the misfortune to lose the *Hannibal*, 74, which accidentally grounded; and, after a long and sanguinary engagement, Sir James found himself compelled to repair to Gibraltar. The failure of his first attempt on the French fleet did not discourage him. Expecting that the enemy's squadron at Cadiz would make use of the first opportunity which the weather might afford of rescuing the French ships at Algeiras, he hastened to put his vessels in a state of repair. This object was effected in a remarkably short space of time. On the 10th of July a French and Spanish fleet, consisting, with the captured *Hannibal*, of ten sail of the line and four frigates, was seen steering for Algeiras. With a squadron of not more than half the strength of the enemy the admiral determined to attack them, for the purpose of preventing their return to Cadiz, and on the 12th sailed out to meet them. The enemy formed their line-of-battle off Cabrita. Shortly after the commencement of the engagement two of the enemy's ships were discovered to be on fire, and about midnight blew up with a tremendous explosion. An accident which occurred at daylight to the *Venerable*, Captain Brenton, the disabled state of the English ships, and the sudden failing of the wind, prevented the admiral from attaining his object, which was to prevent the French and Spaniards re-entering Cadiz; they did so however with the loss of three sail of the line, and upwards of 3000 men, blown up, killed in action, and taken prisoners. An important result of this victory was the preservation of a large fleet of British merchantmen, which it was the object of the French to seize. An unfounded imputation has been attempted to be cast on the naval character of Sir James Sausmarez by a well-known modern French historian, who has asserted that, contrary to the rules of war,

red-hot shot was used by him in that engagement, and that it was owing to these means that the burning of the Spanish ships occurred. This assertion has been indignantly refuted by the concurrent testimony of several who were present at the action. The admiral was rewarded by receiving the Order of the Bath. On the meeting of parliament a motion made by the Earl St. Vincent, and seconded by Lord Nelson, was carried, in which Sir James received the thanks of the house for his gallant conduct in his late actions with the combined fleets of France and Spain. Lord Nelson remarked that "a greater action was never fought." The thanks and freedom of the city of London were also voted to him, with a valuable sword.

At the peace of Amiens Sir James Sausmarez returned to England, and in 1803 a pension of 1200*l.* a year was conferred upon him. On the renewal of hostilities he was appointed to the naval command of Guernsey, which he held till 1806, when he was promoted to the rank of second in command of the Channel fleet under Earl St. Vincent. On the breaking out of the war with Russia, he was intrusted with the important command of the Baltic fleet. He there displayed considerable diplomatic talent, and by his firm but conciliatory conduct he was powerfully instrumental in detaching Russia from her alliance with France. The judicious policy he pursued towards the Northern States has been clearly detailed by his biographer, Sir John Ross, in the work referred to at the end of this article. As an expression of gratitude for the services rendered by Sir James to the court of Sweden, the Grand Cross of the Military Order of the Sword was conferred upon him by the king, Charles XIII. His influence with the king of Sweden was also the chief means by which the neutrality of Sweden was preserved on the accession of Marshal Bernadotte as crown-prince. [CHARLES XIV. of Sweden.]

The changes which took place in the aspect of affairs on the Continent having rendered the presence of a British fleet in the Baltic no longer necessary, Sir James was recalled, and his recall was accompanied by a letter from the Lords Commissioners of the Admiralty, in which they expressed "their marked approbation for the zeal, judgment, and ability evinced by him during his late command."

At the peace of 1814 he was raised to the rank of full admiral; on the visit of the allied sovereigns to England he received their personal thanks for the services which he had rendered to their cause, and, having accompanied them to Oxford, he obtained the honorary degree of Doctor of Civil Law. In 1819 he was appointed rear-admiral, and in 1821 vice-admiral of Great Britain. In 1824 he was preferred to the command of port-admiral of Plymouth, which he held till 1827, and with it may be said to have closed his professional career. At the coronation of William IV. in 1831 he was raised to the peerage of the United Kingdom, with the title of Baron de Sausmarez, of Sausmarez, in the island of Guernsey. He was shortly afterwards made general of marines, and in 1834 an elder brother of the Trinity House. In the same year he was presented by the king of Sweden with a full-length portrait of himself, accompanied by a letter, which showed that time had not effaced from the mind of the king the services rendered by Lord de Sausmarez to Sweden. The remainder of his life was for the most part spent in the enjoyment of quiet and repose on his country estate in Guernsey. His religious zeal, charity, and affable demeanour had endeared him to his countrymen; and his death, which occurred on the 9th of October 1836, was lamented as a public loss. He was succeeded in his title by his eldest son, James, the present peer, who is in holy orders.

(*Memoirs and Correspondence of Admiral Lord de Sausmarez*, by Sir John Ross, 2 vols. 8vo, London, 1838; *Biographical Sketch of Lord de Sausmarez*, appended to Duncan's *History of Guernsey*, London, 1841; James, *Naval History*, London, 1822.)

SAUSSURE, HORACE-BENEDICT DE, was born at Geneva, February 17, 1740. His father Nicolas de Saussure was also a native of Geneva, and is known as the author of some essays, chiefly on agricultural subjects. Young de Saussure was educated with great care, partly at the College of Geneva, and partly under the superintendence of his father and his maternal uncle Charles Bonnet. At the age of twenty-two he was appointed professor of philosophy in the college, in which situation he performed the duties of a public teacher for twenty-five years, interrupted only by his travels in search of physical and especially geological knowledge. The events of his life are consequently few, and the substance of them may be best given in his own words:—

"I had a decided passion for mountains from my infancy. At the age of eighteen I had already been several times over the mountains nearest to Geneva; but these were of comparatively little elevation, and by no means satisfied my curiosity. I felt an intense desire to view more closely the High Alps, which, as seen from the summits of these lower mountains, appear so majestic. At length, in 1760, alone and on foot, I visited the glacier of Chamouni, then little frequented, and the ascent of which was regarded not only as difficult but dangerous. I went there again the following year; and from that time I have not allowed a single year to elapse without making considerable excursions, and even long journeys, for the purpose of studying mountains. In the course of that period I have traversed the entire chain of the Alps fourteen times by eight different routes. I have made sixteen other excursions to the central parts of the mountain mass. I have gone over the Jura, the Vosges, the mountains of

Switzerland and of part of Germany, those of England, of Italy, and of Sicily and the adjacent islands. I have visited the ancient volcanoes of Auvergne, a part of the Vivarais, several of the mountains of Forez, of Dauphiné, and of Burgundy. All these journeys I have made with the mineralogist's hammer in my hand, with no other aim than the study of natural phenomena, clambering up to every accessible summit that promised anything of interest, and always returning with specimens of the minerals and mountains, especially such as afforded confirmations or contradictions of any theory, in order that I might examine and study them at my leisure. I also imposed upon myself the severe task of always marking notes upon the spot, and, whenever it was practicable, of writing out my observations in full within the twenty-four hours."

This sketch of Saussure's travels and labours extends from 1758 till 1779. In addition it deserves to be particularly mentioned, that in 1787 he ascended to the top of Mont Blanc, and remained there three hours and a half making observations; in 1788, accompanied by his eldest son, he encamped for seventeen days on the summit of the Col du Géant, at an elevation of 11,170 feet, for the purpose of studying meteorological phenomena; and in 1789 he reached the summit of Mont Rosa in the Pennine Alps, which was the last ascent of importance which he performed.

Saussure resigned his professorship in 1786. He was afterwards a member of the council of Two Hundred of Geneva; and when that republic was united to France in 1798, he was for some time a member of the National Assembly. The French Revolution however deprived him of almost all his property, which had been deposited in the public funds. An organic disease had begun to develop itself when he was about fifty (probably in consequence of his exertions and privations among the Alps), which, combined with the loss of his property, and the anxiety and distress which he suffered from the convulsions of his country, carried him off at the age of fifty-nine. He died on the 23rd of January 1799.

Saussure kept up a correspondence with many of the distinguished literary men of his time: he was a member of the Académie des Sciences of Paris, and of several other of the scientific societies of Europe; and he was the founder of the Society for the Advancement of the Arts at Geneva, which is still in a flourishing state.

The labours of Saussure in geology are of a character to secure for his name a just and enduring reputation. Physical geology, the research after the causes of geological phenomena, found in him a diligent and discriminating observer unbiassed by the many speculations of his day, but looking forward, through the results of diligent inquiry into facts, to an improved condition of theory. Less speculative than De Luc, more philosophical than Werner, more original than either, he has had few disciples; but modern geologists have largely imbibed the adventurous spirit which carried him round all the precipices and through all the defiles of the Alps, and may yet copy with advantage the calm and correct induction which he applied to the complicated disorder of the strata in these mountains.

Besides geology and mineralogy, the sciences to which he had especially devoted himself, Saussure had directed his attention to botany, chemistry, electricity, and meteorology. He was also the inventor of several ingenious and useful philosophical instruments—a thermometer for measuring the temperature of water at all depths; an hygrometer to indicate the quantity of aqueous vapour; an electrometer to ascertain the electrical state of the atmosphere; and others.

Saussure's first publication was a 'Dissertatio Physica de Igne,' Geneva, 1759; his next was 'Observations sur l'Ecorce des Feuilles et des Pétales,' Geneva, 1762, which was a kind of supplement to his uncle Bonnet's work, 'Sur l'Usage des Feuilles;' and he wrote some excellent 'Essais sur l'Hygrométrie,' 4to, 1763, in which he made known the important discovery that the air expands and becomes specifically lighter in proportion to the increase of the quantity of moisture in it. But his great work is his 'Voyages dans les Alpes,' of which the first volume was published in 1779, the second in 1786, and the last two in 1796. The title of this work conveys a very imperfect notion of its contents, which indeed embrace the whole of those geological travels which have been before alluded to. His other works consist chiefly of dissertations on physical subjects, in the 'Journal de Physique,' the 'Journal de Genève,' and other scientific publications.

SAUVAGES, FRANÇOIS-BOISSIER DE, was born at Alais in Lower Languedoc, in 1706. Having received a moderately good education, he in 1722 commenced the study of medicine at Montpellier, and he took his Doctor's degree in 1726. In 1730 he went to Paris, and soon after seems first to have entertained the idea of forming a classification of diseases like those usually adopted for the objects of natural history. He published a sketch of his system in a small volume in 1731, and by this, and some papers which he wrote at the same time, gained so much reputation, that in 1734 he was appointed a professor at Montpellier. The doctrines which he taught there were chiefly those of Stahl, and he contributed greatly towards the removal of the mechanical theories of medicine that had before been prevalent. In 1740 he was elected professor of botany, and subsequently pursued that science with as much energy as that of medicine. In 1763 he published his most important work, the 'Medical Nosology,' in accumulating materials for which he had steadily laboured for upwards of thirty years. He died in 1767.

Of all the works of Sauvages, and they were very numerous, the 'Nosology' is the only one now often referred to. The system adopted in it has indeed shared the fate of all other nosologies, but it still presents a good and complete account of all that was known of practical medicine at the time of its publication. His other writings were short monographs and essays, which were chiefly printed in the scientific Transactions of the day: the best among them are those on hydrophobia, the remedial value of electricity in paralysis, and the 'Methodus Foliorum,' an essay towards the means of determining plants by the characters of their leaves.

SAUVEUR, JOSEPH, a French mathematician, distinguished by the improvements which he made in the branch of science called acoustics, was born March 24, 1653, at La Flèche, where his father followed the occupation of a notary. Till he was seven years old he was quite dumb, and his organ of voice was never completely developed. He appears to have been born however with a taste for the mechanical arts, and even in childhood he is said to have constructed siphons, fountains, and models of mills. He was sent to a school of the Jesuits, but his taste for calculations caused his mind to be so much diverted from rhetoric and theology, that he made little progress in these studies; and happening to obtain a superficial treatise on arithmetic, he made himself master, without any assistance, of its contents. In 1670 Sauveur travelled on foot to Paris; and one of his uncles having promised to make him a small allowance for his support on condition that he would qualify himself for the ecclesiastical profession, he resumed for a time his theological studies, but a copy of Euclid's Elements which fell in his way, and the lectures of Rohault, soon determined him to abandon this pursuit. Being thrown upon his own resources, for his uncle immediately withdrew the promised allowance, he sought to obtain a subsistence by teaching the mathematics, and in this he appears to have succeeded. At twenty-three years of age, he had the good fortune to attract the notice of Prince Eugene, who received from him some instruction in the sciences; and a foreigner of distinction wishing to be taught the geometry of Descartes, Sauveur, who then had no knowledge of the works of that philosopher, applied himself to the subject with such vigour, that in eight days he was able to give the required instruction. From 1678 to 1680 he was occupied with the study of problems relating to the application of the theory of probabilities to games of chance, and in the latter year he was made mathematical master to the pages of the Dauphiness. In 1681 he was appointed, with Mariotte, to go to Chantilly in order to make some hydraulic experiments at that place; and it was there probably that he was introduced to the Prince of Condé, with whom he subsequently had the honour of corresponding. The conversation of the prince appears to have inspired Sauveur with a desire to make himself master of the art of fortification; and in order that he might join practice to theory, he went in 1691 to the siege of Mons, where he attended daily in the trenches. At the termination of the siege, he visited the fortified places in Flanders, and at the same time he applied himself to the study of military tactics in all its details. At the recommendation of Vauban, he was appointed examiner of the engineers, and was allowed a pension, which he enjoyed till his death.

After his return to Paris, he was appointed, in 1686, to the chair of mathematics in the Royal College; and in ten years afterwards he was made a member of the Académie des Sciences. During the remainder of his life he was employed constantly in improving the mathematical theory of sound; and we learn, not without surprise, that the man who discovered by theory and experiment the velocity of the vibrations of musical strings under various circumstances of magnitude and tension, had neither ear nor voice; in fact it appears that he was obliged to avail himself of the aid of practical musicians in order to appreciate the musical intervals and concords.

This mathematician may be said to have almost invented the science which has since been so much extended by Dr. Brook Taylor, by Daniel Bernoulli, D'Alembert, Euler, and Chladni. Theoretical music had been the subject of part of his lectures at the Royal College in 1697; but the first published details respecting his researches in acoustics are contained in the volume of the Académie for the year 1700. The different papers which he wrote afterwards are in the volumes for 1702, 1707, 1711, and 1713. Sauveur was twice married, and he died July 9, 1716, at the age of sixty-three years, with the reputation of having been a man of kind disposition and great uniformity of temper.

SAVAGE, RICHARD, was born on the 10th of January 1697-98. His mother, the Countess of Macclesfield, had during her pregnancy made a public avowal of her infidelity to her husband, who, in consequence, obtained an act of parliament by which their marriage was annulled, and the offspring rendered illegitimate. Lord Rivers, who was declared by Lady Macclesfield to be the father of her son, so far recognised him as to become his godfather, and to allow him to be called by his name, but he afterwards abandoned him to the care of his mother. The countess disowned her unhappy child, leaving him to pass his infancy and boyhood under the precarious protection of strangers; and had it not been for the charitable intervention of her mother, Lady Mason, the destiny of Savage would probably have been as obscure as the most unnatural parent could have wished. By the kindness of this lady he was sent to a small grammar-school near St.

Alban's, and afterwards placed by his mother with a shoemaker in London. Soon after this, by the accidental discovery of some papers, he became acquainted with the circumstances of his birth, which had been studiously concealed from him; and he made many efforts to obtain an interview with his mother, who however resolutely refused to see him. While very young, Savage commenced his career as an author by taking part in the Bangorian controversy, on which he wrote an unsuccessful poem, afterwards suppressed by himself. At the age of eighteen he published a comedy called 'Woman's a Riddle,' and two years afterwards another, 'Love in a Veil,' both borrowed from the Spanish. Though these were failures, he thereby obtained the notice of Sir Richard Steele and Mr. Wilkes, an actor. He became better known as an author by his tragedy of 'Sir Thomas Overbury,' in which he himself acted the part of Sir Thomas Overbury; and the profits of this play, and of a subscription raised for him at the time, produced a sum which appeared considerable to one so necessitous. In the year 1727 his irregular habits of life led him into one of the tavern broils then very common, in which he unfortunately killed a man, and was tried and condemned to death. The circumstances of the affair, and the doubtful character of the witnesses who appeared against him, becoming generally known after his sentence, intercession was made for him with the queen of George II. by the Countess of Hertford, and the royal pardon was granted to him, in spite of the efforts of his mother, who on this occasion spread a report that he had once attempted her own life.

The notoriety of this event was succeeded by an extraordinary reaction of public opinion in his favour: he was courted by all ranks, the fashions of the day were ruled by his opinions, and he was enabled to maintain an appearance in society above his station by means of an annuity of 200*l.* a year obtained from his mother's relations, under the threat that he would expose her cruelty by lampoons if she refused to support him. At this time he published his longest poem, the 'Wanderer,' which was much admired at the time.

Prosperity made more apparent that fickleness of character which led him into extravagance and alienated his friends from him. His fair prospects were soon for ever clouded by a quarrel with his patron Lord Tyrconnel, who accused him of ingratitude, and banished him from his house. His acquaintance in consequence generally deserted him, and he sank into obscure poverty as suddenly as he had emerged from it. The remainder of his life was passed in discreditable efforts to regain his position in society by alternately flattering and satirising all from whom he had anything to hope or fear. In despair of ever conciliating his mother, he published 'The Bastard,' the severity of which drew down upon her much public indignation, though it does not seem to have re-awakened sympathy in favour of the author. After an unsuccessful attempt to obtain the situation of poet-laureate, Savage received from the queen a pension of 50*l.* a year as a reward for a poem in honour of her birthday, which his gratitude renewed annually from this time till her death, when the royal bounty was withdrawn from him. Having made no provision for such a contingency, he was obliged, from his necessities, to leave London in the year 1739, retiring first to Bristol and then to Swansea, where he lived for about a year, receiving an allowance raised by subscription among his friends. In January 1742-43, on his return to Bristol, he was arrested for a debt of 8*l.*, and sent to prison in that city, where he died, on the 31st of July 1743.

The name of Savage has become better known than his merits deserve, from the singularity of his early misfortunes, and still more from the elaborate life of him which Johnson, the companion of his distresses, has inserted in his 'Lives of the Poets.' This memoir is interesting not only as a most faithful picture of the adventurous career of Savage and of the manners of his age, but because it exhibits very strikingly the chief excellences and defects of the author as a biographer and a critic. The writings of Savage are in unison with his character. The carelessness and want of system in his graver compositions, the frivolity in the choice and treatment of lighter subjects, his unchastened style, feeble in its vehemence, illustrate the strength of feeling and passion, the infirmity of purpose, the thoughtless improvidence and want of settled principles of conduct, which made the actions of Savage as inconsistent as his fortune was chequered. In his 'Wanderer,' he declaims without the moral dignity of a didactic writer, his versification is harsh, his descriptions are tedious, and the whole poem is ill arranged and thronged with confused imagery. Savage made enemies as readily as friends, and he testified his resentment by satires full of coarse personal invective.

From this general censure of the works of Savage, 'The Bastard' is in a great measure to be excepted. Strong natural feelings, goaded by a sense of undeserved wrongs, gave to this poem a concentrated energy of expression, a refinement of sarcasm, and an exalted tone of thought, of which there are only faint traces in his other writings.

SAVARY, ANNE-JEAN-MARIE, DUC DE ROVIGO, was the son of a veteran officer, and was born at Mans, in the Ardennes, April 26, 1774. His father had sufficient influence to obtain for him the grade of sub-lieutenant in the infantry regiment, the Royal Normandie, in 1789, a few weeks before the first outbreak of the Revolution. In 1793 he was already a captain, at the age of nineteen.

In the republican campaigns of 1794-95, when the French and Austrian armies alternately invaded each other's territory, Captain

Savary was attached to the army of the Rhine, under Custine, Pichegru, and Jourdan. He was soon distinguished for his intelligence and alacrity; and when Moreau took the command of the same army in 1796, General Desaix, an excellent judge of merit, selected Savary to be his aide-de-camp. At Marengo, June 14, 1800, when General Desaix was killed, Savary his aide-de-camp conveyed to the First Consul intelligence of the loss which the French army had sustained. Grieved as he was himself to lose the general whom he esteemed the ablest of all those he ever commanded, Bonaparte was struck with the evident sorrow of the young officer. He immediately adopted him, and his brother aide-de-camp, Rapp, and attached them both to his own person, in the same capacity. Shortly after Savary was promoted to a brigade. He soon acquired the entire confidence of his master. From 1802, exclusive of his military service, he was charged with the secret police of the First Consul, in which the most powerful personages in the state, not excepting the minister Fouché, were placed under his surveillance, whereby he raised up a host of enemies against him, and became the butt of many malicious reports. Among other things he was accused of instigating the murder of Captain Wright, of the strangling of Pichegru, and with behaving with brutality to the unfortunate Duc d'Enghien, with the superintendence of whose execution he was charged.

In 1805, having been raised to a division, General Savary was entrusted by Napoleon I. with a private mission to the Emperor of Russia. The following year he was honoured with the command of two regiments of the Imperial Guards, and afterwards with that of the 5th corps. He was now, at the age of thirty-two, a leader of armies, and that he was equal to the task was proved by the brilliant victory at Ostrolenka, February 16, 1807. For this exploit, and his good conduct at the battle of Friedland, he received his title as Duc de Rovigo. He was sent to the peninsula in 1808, and he it was who prevailed on Charles IV. and Prince Ferdinand to undertake the journey to Bayonne, to meet Napoleon. Napoleon appointed the Duc de Rovigo minister of general police in 1810. He was left in this important office during the march to Moscow in 1812, and was still performing its duties when the famous conspiracy of General Mallet exploded. Having been arrested in his bed, Savary was detained for several hours at the prison of La Force, until the presence of mind of General Hullin had averted the plot. The intelligence of Mallet's conspiracy induced Napoleon to leave the army in Russia, but he still continued to place the same trust as ever in the Duc de Rovigo. In 1815 Savary was raised to the Chambre des Pairs, during the Hundred Days, and invested with the command of the gendarmerie. The British government refused his request to be allowed to follow his master to St. Helena. The rest of his life was spent in obscurity, from which he was partially withdrawn in 1823 by a vindication of his conduct with regard to the murder of the Duc d'Enghien, in which he attempted to remove the stigma from himself to Prince Talleyrand. The loud outcry which replied to this appeal drove him from France. He returned after the revolution of July 1830.

On the 1st of December 1831 Louis-Philippe appointed him to the command of Algeria; but his administration did not give satisfaction, and his unfortunate antecedents increased his unpopularity; he was therefore recalled in 1833. He died in the course of the following year, in comparative indigence, leaving a large family almost unprovided for. His son, the present Duc de Rovigo, has acquired some reputation as a musical and dramatic critic, in the newspaper feuilletons.

SAVARY, NICOLAS, was born in 1750 at Vitré in Bretagne, France. Having completed his studies at the college of Rennes, he went to Paris, where he resided for some time. He had early conceived a desire of travelling, and in 1776 he landed in Egypt, where he remained till 1779. He was some time at Alexandria and Rosetta, but fixed his residence chiefly at Cairo, making occasional excursions in the neighbourhood, and to Damietta and other places in Lower Egypt. He re-embarked at Alexandria in September 1779, and travelled during two years or thereabouts among the islands of the Grecian Archipelago. It is probable that he returned to France about the middle of 1781.

The first work which Savary published after his return was a translation of the Korán, the greater part of which had been made in Egypt, 'Le Coran, traduit de l'Arabe, accompagné de Notes, et précédé d'un Abrégé de la Vie de Mahomet,' 2 vols. 8vo, Paris, 1783. This is the best translation of the Korán which the French possess. The materials for the Life of Mohammed have been drawn chiefly from Abu'l Feda and the 'Sunnah,' a collection of traditions considered authentic by the Arabians. Savary next published a series of extracts from the Korán, under the title of 'Morale de Mahomet, ou Recueil des plus pures Maximes du Coran,' 12mo and 18mo, Paris, 1784.

In 1784 Savary published the first volume of his 'Lettres sur l'Egypte.' The other two volumes were published in 1785, together with a new edition of the first volume, 3 vols. 8vo, Paris. This work had at first an extraordinary reputation. The interest connected with the country itself, especially the monuments of Ancient Egypt, the picturesque style, and the brilliant colouring of the descriptions, rendered the work extremely popular. It was translated into German (8vo, Berlin, 1786) and English (2 vols. 8vo, London, 1786-87). Many objections however were afterwards made to the work, as that it

contained few new facts—the description of the pyramids having been taken from Maillet, the account of Upper Egypt from the Père Sicard, and other parts from Joinville, &c.

Savary was afterwards severely commented upon by Michaelis, in his 'Journal of Arabic Literature,' who affirmed that in making use of Abul' Feda he has always had recourse to Michaelis's Latin translation, and has not even understood that correctly, and that he was ignorant even of the pronunciation of the vernacular Arabic. The publication of Volney's 'Travels in Egypt' about the same time, which contains numerous contradictions of Savary, added to the annoyance arising from the criticisms of Michaelis, and the decline of his reputation is said to have affected his health, which was naturally delicate. He died at Paris February 4, 1788, at the age of thirty-eight.

A few months after Savary's death, his 'Lettres sur la Grèce,' a work which he was engaged upon during his illness, was published at Paris in 8vo. It is incomplete, the author having worked up only a part of his materials at the time of his death. A tale translated from the Arabic, 'Les Amours d'Anas Eloujoud et de Ouardi,' was published in 1789, 18mo. Savary had composed while in Egypt a 'Grammaire de la Langue Arabe Vulgaire et Littérale,' which he had presented to the French government in 1784, and it was ordered to be printed, but for want of Arabic type it lay in the royal printing-office till it was claimed on behalf of Savary's brother, by whom it was again presented to the government, and it was again ordered to be printed in 1796, but the publication was not completed till 1813 (4to, Paris), and in the meantime the Arabic grammars of D'Herbin and Silvestre de Sacy had already appeared. It is in French and Latin, with many familiar dialogues and Arabic tales and songs, which in some degree compensate for the brevity of the syntax. This grammar however will not bear comparison with that of De Sacy. Savary was also engaged upon an Arabic Dictionary, but none of it has ever been printed.

\* SAVIGNY, FRIEDRICH CARL VON, one of the most distinguished jurists of modern times, was born February 21, 1779, in the city of Frankfurt-on-the-Main. The family was of French origin, but Savigny's father was born at Trarbach in Germany, a small town on the Moselle, and he occupied a situation of importance in the government of Frankfurt. He died in 1791, and his wife in 1792. All their children had died at an early age except Friedrich Carl, who was thus left, at the age of thirteen, without parents and without any near relations. Herr Von Neurath, however, who had been on terms of intimacy with his father, took him under his charge, and placed him, together with his own son, who was about the same age, under suitable teachers for completing his education. He was intended for the legal profession; and German law being founded on Roman law, during the summer half of the year 1795 he attended a course of lectures by Erxleben on the 'Pandects,' and during the winter half a similar course by Weis, and from the latter he also received private lessons, together with four other pupils. In October 1796 Savigny proceeded to the University of Göttingen, but in the spring of 1797 his studies were interrupted by illness, and he retired into the country till the autumn of that year, when he went to the University of Marburg, in Upper Hesse, where he took his degree of Doctor of Law, October 31, 1800. He then began to teach as a privat-docent in the university, that is, as a professor, but without other emolument than the fees of his auditors.

During the period from 1800 to 1804 Savigny delivered, as professor extraordinary, courses of lectures on the 'Pandects,' on Ulpian, on the laws of succession, of obligations, &c., and on Hugo's 'History of Roman Law,' a work which had greatly interested him. In 1803 he published his first work, 'Das Recht des Besitzes,' which has been translated into English under the following title, 'Von Savigny's Treatise on Possession, or the Jus Possessionis of the Civil Law, translated from the German by Sir Erskine Perry, Chief Justice of the Supreme Court of Bombay,' 8vo, 6th edition, 1848.

In 1804 Savigny married Miss Brentano, the daughter of a banker at Frankfurt. Soon after his marriage he quitted the University of Marburg in order to make a journey in Germany, Northern Italy, and France. He inspected the libraries of Heidelberg, Stuttgart, Tübingen, Strasbourg, and others, making minute researches, and taking copious extracts, and returned with a rich supply of materials on matters connected with legal history and practice. In 1808 he became professor of law in the University of Landshut in Bavaria; and in 1810, on the establishment of the University of Berlin, he was appointed to a similar professorship there, and was also made a member of the Royal Academy of Sciences. Not long afterwards, when the thoughts of persons connected with the law were much occupied by a project for a revised code of laws for all Germany, he published his views on the subject, 'Vom Beruf unserer Zeit für Gesetzgebung und Rechtswissenschaft,' 8vo, 1814. He soon afterwards commenced the publication of his 'History of the Roman Law in the Middle Ages' ('Geschichte des Römischen Rechts im Mittelalter'), 6 vols., 8vo, Heidelberg, 1815-1831. This work contains a large amount of valuable information on the introduction of Roman Law into Germany, and other Continental countries.

In 1816 Savigny was appointed a Privy Counsellor of Justice (Geheim Justizrath), and in 1817 a Member of the Council of State (Mitglied des Staatsraths). He was also made a Member of the Court of Revision (Revisionshofes). In 1836 he published a 'Contribution

to the Legal History of Nobility in Modern Europe' ('Beitrag zur Rechtsgeschichte des Adels in Neuern Europa'), 4to, Berlin, 1836. The last and most important of his works, the 'System of Modern Roman Law' ('System des Heutigen Römischen Rechts') is not yet completed. The first four volumes were published at Berlin, in 8vo, in 1840, and the fifth in 1841. The sixth volume, owing to the pressure of other occupations, as he states in the preface, was not published till 1847. The seventh volume was published in 1848, and the eighth in 1849. This completes the Third Book, and may, as he informs his readers, be considered as completing the general part of the work. The plan of the whole work is laid down at the commencement of the first volume as follows:—Book I. 'Rechtsquellen' ('Sources of Law'). Book II. 'Rechtsverhältnisse' ('Legal Relations'). Book III. 'Anwendung des Rechtsregeln auf die Rechtsverhältnisse' ('Application of the Rules of Law to Legal Relations'). Book IV. 'Sachenrecht' ('The Law of Things,' that is, Ownership). Book V. 'Obligationenrecht' ('The Law of Obligations,' that is, Contracts, &c.). Book VI. 'Familienrecht' ('The Law of Family,' or the Law of Marriage and the relations that arise out of it). Book VII. 'Erbrecht' ('The Law of Succession,' testamentary and intestate). Books IV., V., VI., and VII., are to be published as separate works, but will be written in accordance with the original plan. A portion of this latter part has since been published—'Das Obligationenrecht, als Theil des Heutigen Römischen Rechts,' 2 vols. 8vo, 1851. It is much to be desired that the author may live to complete this important work, which is characterised by a depth and subtlety of thought, a soundness of knowledge, perspicuity of arrangement, and clearness of expression, which have seldom been equalled, and perhaps never surpassed.

In 1842 Savigny was made a Privy Minister of State (Geheim Staatsminister), and also Minister of Justice for the Revision of the Law (Justizminister für die Gesetzrevision). In 1850 he published his Miscellaneous Works ('Vermischte Schriften,' 5 vols. 8vo, Berlin), consisting of the writings, which, with the exception of those before mentioned, he had published in the course of half a century in periodical works. He was also joint editor, with Eichhorn, Göschel, Klentze, and Rudorff, of the 'Zeitschrift für Geschichtliche Rechtswissenschaft,' which was completed in 15 vols. between 1815-50.

SAVILE, GEORGE, MARQUIS OF HALIFAX, was born in 1630. He was the son of Sir William Savile, a Yorkshire baronet, of ancient family, and of Anne, daughter of the lord keeper Coventry. Being hereditarily attached to the Stuarts, ambitious, and endowed with brilliant talents, he played an active and a successful part in the intriguing reigns of Charles II. and James II. In 1668 he was raised to the peerage, by the titles of Lord Savile of Eland and Viscount Halifax; he was created earl in 1679, and marquis in 1682. He died in 1695, and the title became extinct in 1700, by the death of his son. The witty Lord Chesterfield was his grandson by the mother's side.

It is hard to state shortly his political history or principles, except by saying that he was the chief of the body to which the expressive name of Trimmers was given. So far however as he was attached to any principle, it seems to have been to the cause of civil liberty as then understood. He opposed the Non-resisting Test Bill in 1675, as well as, both in those times and after the accession of James, the relaxation of the tests enacted against the papists. He opposed the scheme for excluding the Duke of York from the succession, preferring to limit his authority when the crown should devolve on him. He declined to take part in bringing over the Prince of Orange; but was president of the convention parliament, and strongly supported the motion for declaring the throne vacant. On the accession of William and Mary he was made privy seal; but he soon retired from the administration, upon inquiry being proposed to be made as to the authors of the prosecutions of Lord Russell, Sidney, &c., in which he, as a member of the then existing government, had concurred; and he continued in opposition thenceforward till his death, which happened in 1695.

"He was," says Burnet, "a man of great and ready wit, full of life, and very pleasant, much turned to satire. . . . He was punctual in his payments and just in all private dealings; but with relation to the public, he went backward and forward, and changed sides so often, that in the conclusion no side trusted him; he seemed full of commonwealth notions, yet he went into the worst part of King Charles's reign. The liveliness of his imagination was always too hard for his judgment. His severe jest was preferred by him to all arguments whatever: and he was endless in council, for when after much discourse a point was settled, if he could find a new jest, whereby he could make that which was digested by himself seem ridiculous, he could not hold, but would study to raise the credit of his wit, though it made others call his judgment into question," &c.

His works are lively and elegant. The chief of them are these: 'Character of a Trimmer,' 'Anatomy of an Equivalent,' 'Letters to a Dissenter,' 'Miscellanies,' and 'Maxims of State.' He left two manuscript copies of his memoirs, both of which were destroyed unpublished, one by the Earl of Nottingham, the other by his granddaughter Lady Burlington. Horace Walpole says that this was done at Pope's suggestion, because the papists were represented in an unfavourable light. The loss is to be regretted, considering the strong satirical talent and position of the author.

SAVILE, SIR HENRY, an eminent scholar and mathematician, was

born at Over Bradley, near Halifax, in Yorkshire, November 30, 1549. He was admitted a student of Merton College, Oxford, in 1561, where he proceeded to the degree of B.A., and was chosen fellow of the college. He took the degree of M.A. in 1570, about which time his fondness for the mathematics induced him voluntarily to read public lectures in the university on Euclid, Ptolemy, and other writers. He also served as proctor for two years, and in 1578 he made a tour through the Continent, and at his return had the distinguished honour of being chosen tutor in the Greek language to Queen Elizabeth, who, it is said, had a great esteem for him. He was elected warden of Merton College in 1585, in which office he continued for thirty-six years, and greatly benefitted that society by his exertions. During his time he enriched the literature of his country with several classical and historical publications. He was made provost of Eton College in 1596, and on the accession of King James he was knighted. He died at Eton College, on the 19th of February, 1622, in the seventy-third year of his age, and was buried in the chapel there. On this occasion the University of Oxford paid the greatest honours to his memory, by having a public speech and verses made in his praise, which were published under the title of 'Ultima Linea Savilii.' He was indeed a munificent benefactor to the University of Oxford, in which, besides various other donations, he founded, in 1619, two professorships, one of geometry, the other of astronomy, which are still maintained. His library, consisting of a very curious and valuable collection of scientific books and manuscripts, he left to the university, and it is now preserved in a separate room near the Bodleian Library, the two Savilian professors being the only persons who have immediate access to it. His fame principally rests on a magnificent edition of all the works of St. Chrysostom, which was published in 1613, in 8 vols. folio, in the production of which he is said to have expended no less than 8000*l.*, and on his collection of our best historians, published in 1596, under the title of 'Rerum Anglicarum Scriptorum post Bedam.' As a mathematician, he is known principally by his 'Lectures on the first book of Euclid's Elements,' published in 1621, but several manuscript collections of his on the history of the sciences are preserved in his library at Oxford.

SAVONAROLA, GIROLAMO, a Dominican monk, a native of Ferrara, made himself known by his eloquent preaching at Florence, where he was living in the convent of S. Marco, which belonged to his order, in the latter part of the 15th century. In his sermons he used at times to assume the tone of a prophet, foretelling public calamities as a punishment for the sins of the people. Florence was then enjoying peace and prosperity under the administration of Lorenzo de' Medici, all Italy was quiet, and yet Savonarola startled his hearers by foretelling the approaching irruption of fierce foreign hosts, which would bring bloodshed and desolation over the land. A few years after, his prophecy was fulfilled by the invasion of Charles VIII. of France and his ruthless bands, and an age of calamities began for Italy. Before this however Savonarola was wont to inculcate democratic doctrines; he recommended a return to the former popular system of government, which had been interrupted by the ascendancy of the Medici; and he even declaimed against Lorenzo himself. Lorenzo took little notice of this; and when his friends urged him to check the monk's audacity, he replied, that as long as the preacher exerted himself to reform the morals of the citizens of Florence, he should willingly excuse his incivility to himself. When Lorenzo fell ill, in the spring of 1492, and his life was despaired of, Savonarola appeared by his bed-side, some say at Lorenzo's own request. The conversation that followed is variously related. Poliziano, an eye-witness, states that Savonarola exhorted Lorenzo to be firm in the Catholic faith, to which the sick man assented. The monk then asked Lorenzo whether, in case he recovered, he purposed to live a virtuous and well-regulated life, to which a ready assent was also given. Lastly, Savonarola told Lorenzo that he ought to bear his death with resignation, if such be the will of God. "With cheerfulness," replied Lorenzo. Savonarola was then going to quit the room, when Lorenzo called him back, and requested his benediction, which the monk readily gave in the solemn form of the liturgy, Lorenzo pronouncing the usual responses with a firm and collected voice.

Such is the account of Poliziano, written soon after the event, but a different one came into circulation a long time after, and was registered in the biography of Savonarola, written by Gianfrancesco Pico di Mirandola, nephew of the celebrated Giovanni Pico, the friend of Lorenzo. The story is, that Savonarola was sent for to hear Lorenzo's confession, and that among other injunctions to which Lorenzo readily assented, the monk required him to promise that if he should recover, he would restore the republic to its former state of popular freedom, and as Lorenzo made no reply to this, Savonarola left him without giving him absolution. Roscoe thinks this tale to have been an invention of that party spirit which broke out some time after Lorenzo's death, and which led to the expulsion of Piero de' Medici, Lorenzo's son, in 1494. Savonarola acted a conspicuous part in the disturbances which followed. He became the leader of the democratic party, which was styled the Piagnoni or lachrymose party, because, in imitation of their leader, they were continually denouncing and bewailing the sins and corruption of their fellow-citizens. The opposite or aristocratic party, that wished to place the government in a few hands, were styled Compagnacci, and also Arrabbiati, or

'enraged.' The Piagnoni succeeded for a time, and a general legislative council was formed of 830 citizens, above thirty years of age, and who were "netti di specchio," that is to say, inscribed in the public books as having always paid their taxes regularly. A vast hall was constructed for their meetings in the town palace. Savonarola's influence was now very great, being looked upon by his party as a kind of prophet and supreme judge. Grave citizens mixed with friars, and children, assembled in the public places crying 'Viva Cristo,' singing hymns composed for the occasion, and dancing with frantic gestures. But the Arrabbiati were not idle; they represented Savonarola as an impostor, and they accused him of heresy at Rome. Pope Alexander VI. (Borgia) summoned him to appear before him, in default of which he excommunicated him. Savonarola, who had long been preaching against the corruptions of the clergy, did not spare the head of the Church, whom he styled an usurper, and he wrote to several princes urging them to assemble a general council, before which he made sure of proving that Alexander not only was not a legitimate pontiff, but was not even a Christian. In the year 1497, Piero de' Medici made an attempt to re-enter Florence by surprise, at the head of an armed party, but the plot was discovered, and several of his abettors within the town being arrested, five of them were condemned to death, and the rest to banishment. They appealed from their sentence to the great council of the citizens, but Savonarola and his party urged the immediate execution of the sentence, and the five were beheaded. This enraged the aristocratic party, who, joined to the secret enemies which Savonarola had among the clergy, encouraged two Franciscan monks to preach against him. Savonarola, thus assailed, called to his aid a brother Dominican, Domenico da Pescia, and both retorted from the pulpit against the Franciscans. The contest was kept up for some time with mutual accusations and vituperations, until Fra Domenico, excited beyond reason, proposed to prove the superiority and sanctity of his master by walking through the flames, and, strange to say, one of the Franciscans undertook to do the same on the part of his brethren. The mode of trial was arranged by the magistrates; a mass of combustibles was laid in the square, and a walk was made across, through which the champions were to pass while the faggots were blazing. On the appointed day, 17th April, 1498, Savonarola and his champion, attended by a numerous procession, made their appearance, giving out the psalm 'Exurgat Deus et dissipentur inimici ejus.' His opponent Fra Giuliano Rondinelli, attended by some Franciscan monks, walked silently and steadily to the place of trial; the flames were kindled, and the crowded spectators stood in mute astonishment and expectation, when Savonarola proposed that his champion Domenico should bear the consecrated host through the fire. This proposal shocked the whole assembly, and the magistrates and heads of the clergy exclaimed against it as a profanation, and as a tempting of God himself. Fra Domenico however refused to proceed without the host, and the trial was given up. This business ruined the credit of Savonarola: on his return to his convent of S. Marco he was taunted by the populace, and soon after a party of his enemies entered the convent by force, and dragged him, with Domenico and another monk, to prison. He was tried before a mixed lay and ecclesiastic commission appointed by Alexander VI. His eloquence at first startled his judges, but the implements of torture being produced, the firmness of Savonarola failed him, and he acknowledged the falsehood of his pretensions to supernatural powers. He was condemned to death, and he and his two associates, being led to the spot prepared for execution, were first strangled, and their bodies thrown into the flames, on the 23rd of May, 1498.

Savonarola left several works, both in Italian and in Latin, one of which, entitled 'Triumphus Crucis,' is a demonstration of the truth of Christianity. His sermons however, of which some remain, are the most remarkable of his productions. He was eminently a popular orator, and profoundly versed in the art of exciting the feelings. His memory has found several apologists, among the rest Filippo Neri, and Barotti, in his 'Biographies of Authors, Natives of Ferrara.'

SAXE, MARSHAL. MAURICE, COUNT OF SAXONY, was the natural son of Augustus II., king of Poland and elector of Saxony, and of the Countess of Konigsmarck, a Swedish lady of high rank. Maurice was born at Dresden, on the 19th of October 1696. In 1708, when only twelve years old, he served in the army of the allies under the Count of Schulembourg before Lisle; in 1709 he had a horse shot under him at the siege of Tournay; and he was at the battle of Malplaquet in the same year. His father soon afterwards gave him a regiment of cavalry, with which he fought against Sweden, and was at the taking of Stralsund. When he was only fifteen years of age his mother got up a marriage between him and the heiress of the counts of Loben, a German lady, who was about the same age.

When Prince Eugene was besieging Belgrade he was joined by Maurice of Saxony, who, when the campaign was terminated, returned to Dresden, and after a short stay repaired to Paris (1720), where he was introduced to the Duke of Orleans, then regent, who received him in the most flattering manner, and conferred on him the title of Mareschal-de-Camp. On his return to Dresden to ask his father's permission to accept the dignity, he contrived to separate himself from his wife by procuring a divorce. No blame is imputed to her except jealousy, for which there was no doubt sufficient cause, constancy in his attachments to the other sex being by no means one of the charac-

teristics of Maurice. He soon returned to France, and took the command of a regiment, which he manoeuvred according to a plan of his own, and for which he received the praise of Folard. He continued for a considerable time to study mathematics and the art of attacking fortified places under that skilful tactician.

In the year 1726 Maurice of Saxony set out for the north, in the hope of being elected Duke of Courland through the interest of his father. By the exertions of Anna Iwanowna, duchess of Courland (widow of the Duke Frederic William, who died in 1711), who had conceived an attachment to him, his election was carried, though there were other candidates, and he was opposed by the Czarina Catharina I., who sent Menzikoff to seize him in Mitau; but he defended himself in the palace, and the Russians retired. The Russian influence was then used in the Polish diet, which, in virtue of its right of suzerainty, summoned him to appear before them; but he refused to do so, and the diet in consequence signed his proscription. He attempted to defend himself in his territory, but the Russians forced him to flee, and he escaped to France with nothing but his diploma of election. In 1728, after the death of Catharina I., the Duchess of Courland, whose attachment to him continued, invited him to return, which he did; and there is little doubt that she would have made him her partner on the throne of the czars, to which she was elected in 1730, if she had not previously discovered a glaring instance of his inconstancy, whereupon he was immediately dismissed. He then returned to Paris, and afterwards repaired to Dresden. His father, Augustus II., died in 1733.

War having been declared between France and Austria in 1733, Maurice of Saxony repaired to the court of Versailles to solicit employment, and he was sent to the army of the Rhine, commanded by the Duke of Berwick. He distinguished himself at the siege of Philippsburg, and was appointed lieutenant-general at the peace of 1736. He now returned to Dresden for the purpose of prosecuting his claim to the dukedom of Courland, but failing in this attempt, he went again to Paris, and devoted himself to the study of the art of war and to the completion of a work on which he had employed himself for some time, and which he called '*Mes Réveries*.'

On the death of the Emperor Charles VI., in 1740, a general war broke out. Louis XV. sent an army into Bohemia under the Marshal of Belle-Isle, the left wing of which was confided to the Count of Saxony, who was charged with the investment of Prague (1741), which he took by assault in a few days, and with equal rapidity the fortress of Egra. He was afterwards appointed to the command of the army of Bavaria, and displayed equal skill in defensive warfare as in offensive. He was also employed in the defence of Alsace, when he was suddenly summoned by Louis XV. to assist in placing Prince Edward the Pretender on the throne of his ancestors, but he had scarcely reached Dunkirk when a tempest destroyed a part of his squadron, and the rest was blockaded by an English fleet. Maurice returned to Versailles, and Louis bestowed on him the staff of a Marshal of France (March 1743).

In 1744 Louis XV. entered Flanders with an army of 80,000 men, the left wing being under the command of Marshal Saxe, who was appointed to cover the sieges which were to be undertaken by Marshal Noailles under the immediate inspection of the king. Menai, Ypres, and Furnes were quickly gained, when news was brought that Prince Charles had entered Alsace. The king and Marshal Noailles hastened to its defence with the greatest part of the troops, leaving Marshal Saxe alone in Flanders to act on the defensive against an army three times as numerous as his own; he maintained his position however with consummate skill, keeping the allies continually in check, and retaining the conquests which had been made at the beginning of the campaign.

In 1745 Louis XV. returned to Flanders with a large additional force, amounting, with that already in Flanders, to 100,000 men, of which Marshal Saxe was now appointed general-in-chief, Marshal Noailles consenting to act under him. On the 22nd of April 1745 the campaign was opened by the siege of Tournay. The allies advanced to its support with 45,000 men, English, Hanoverians, and Dutch. Marshal Saxe was suffering under dropsy, and underwent the operation of tapping on the 18th. Notwithstanding, he advanced to oppose the allies with a force not exceeding theirs, he himself being obliged to be borne in a litter. On the 11th of May he was attacked near the village of Fontenoy, where he had put himself in position. The English and Hanoverians advanced to the attack of his redoubts in a dense column, and for awhile bore everything before them, sustaining repeated attacks of cavalry and the steady and uninterrupted fire of the French infantry with a determination which seemed to make victory certain. But the perseverance of Marshal Saxe at length prevailed: the Dutch kept aloof, and four large pieces of artillery being also brought to bear upon the English column, it was at length compelled to give way, and defeat followed. The French victory at Fontenoy, one of the most memorable of the 18th century, was soon followed by the conquest of all Belgium. The conqueror of Fontenoy was presented by Louis XV. with the château of Chambord, and 100,000 francs of annual revenue arising from the estate. Tournay, Ghent, Bruges, Oudenarde, Ostend, Brussels, Mons, Charleroi, and Namur were all taken between the 23rd of May 1745 and the 19th of September 1746.

In the campaign of 1747 Marshal Saxe took Lafeldt after a hard-fought battle (July 2), which he followed up by the conquest of Bergen-op-Zoom, and in 1748 by that of Maastricht. The allies now made overtures of peace, which was definitely settled at Aix-la-Chapelle in the same year. Marshal Saxe survived about two years to enjoy the honours which were lavishly showered upon him. He died on the 30th of November 1750.

Marshal Saxe's work, '*Mes Réveries*,' was published in 1757, 5 vols. 4to. It is a work on military affairs, which is said to contain a good deal of valuable matter mixed up with many assertions which cannot be relied on. It was translated into English by Sir William Fawcett — '*The Reveries*; or, *Memoirs upon the Art of War*, by Field-Marshal Count Saxe; translated from the French,' 4to, 1757.

Marshal Saxe was a soldier, and "a ripe and good one," but nothing more. When at the height of his reputation, the Académie Française absurdly offered to make him a member, which he had the good sense to decline; for though he had great knowledge of his art and of all matters connected with it, his literary acquirements would have done no honour to that learned body, if we may judge from the following specimen of his orthography given in the '*Biographie Universelle*':— "*Ils veule me fere de la Cademie; sela miret come une bage a un chas*." The marshal was a man of large size and extraordinary personal strength.

SAXE-WEIMAR, BERNHARD, DUKE OF, born at Weimar on the 16th of August 1600, was the fourth of the seven sons of John, duke of Saxe-Weimar. As all the important circumstances of his life are connected with the Thirty Years' War in Germany, we can only give here a brief statement of the leading facts of his career.

After the battle of Prague (November 3, 1620), Bernhard served in the army raised by the Margrave of Baden-Durlach for the purpose of assisting Frederic V., king of Bohemia and elector-palatine, to support himself after the loss sustained in that disastrous affair. In 1623 he commanded a regiment of infantry in the army of Duke Christian of Brunswick; and in 1625, and again in 1627, he was placed at the head of a regiment of cavalry in the Danish army raised by Christian IV. in support of the Protestant Union. After the alliance between Louis XIII. and Gustavus Adolphus (January 13, 1631) he joined the latter, who promised him the bishoprics of Bamberg and Würzburg, with the title of Duke of Franconia. Bernhard distinguished himself at the siege of Würzburg, in forcing the passage of Oppenheim, and in the Palatinate, where he took Mannheim by stratagem, and forced the enemy from all his posts in that quarter. Gustavus afterwards appointed him to the command of an army designed for the conquest of Bavaria, with which he advanced as far as the mountains of the Tyrol, obtained possession of the three fortresses of Ehrenburg, the keys of that country, and put the emperor in fear for his Italian states. Gustavus however recalled Bernhard to assist him against Wallenstein, and shortly afterwards they fought together at the battle of Lützen, November 16, 1632. When Gustavus fell, the Duke of Weimar took the command, and forced the enemy to retreat, and shortly afterwards drove the imperial army out of Saxony.

The Swedish army was afterwards divided into two parts by the chancellor Oxenstierna, and placed under the command of Marshal Horn and Bernhard of Weimar. Bernhard besieged and took Ratibon, which however was afterwards retaken by the imperial army (July 29, 1634), and Bernhard and Horn were afterwards defeated at Nordlingen (September 7, 1634), owing to the impatience of the Duke of Weimar to give battle without waiting for the arrival of reinforcements. On the 6th of October 1635, Bernhard concluded a treaty of alliance and subsidy with the King of France. He was occupied for a considerable time in a series of less important affairs, and in quelling the mutinous spirit of the German armies, by procuring, through the agency of Oxenstierna, a portion at least of the arrears of pay. On the 3rd of March 1638 he gained the great victory of Rheinfelden, and obtained possession of the fortress on the 22nd of March. He afterwards besieged Alt Breisach, then considered one of the strongest places in Europe, which capitulated on the 19th of December 1638. He died suddenly at Neuburg on the Rhine, of a pestilential fever, on the 18th of July 1639.

SAY, JEAN BAPTISTE, a writer on political economy, was born at Lyon in 1767, and died at Paris, November 16th 1832. He came to the capital at an early period of the revolution, and was one of the projectors and conductors of a journal entitled '*La Décade Philosophique*,' one of the small number of literary and scientific works that maintained an existence during the revolutionary storm. After the 18th Brumaire, Say was called to the tribunate, the only semblance of a deliberative assembly which remained after the revolution. It soon became the mere instrument of the First Consul's will, and Say ceased to be a member of it at the time when Napoleon was named emperor. He resigned an appointment, subsequently conferred upon him, of receiver of taxes for the department of Allier. He afterwards established a manufactory of some kind. On the whole he appears to have passed a quiet and retired life, engaged in his various works on political economy, and in lecturing on this and kindred subjects at the Conservatoire des Arts et Métiers at Paris.

The great merit of Say consists in having rendered the science of political economy popular in France. He followed closely in the steps of Adam Smith; but besides having placed the doctrines of his

predecessor in a clear and luminous point of view by judicious arrangement, his works contain "several accurate, original, and profound discussions" (Ricardo), among which may be mentioned his exposition of the nature and causes of gluts.

The works of Say are:—1, 'Traité d'Economie Politique,' published in 1802; 5th ed., 1826. 2, 'Catechisme d'Economie Politique,' 1815; 5th ed., 1826. 3, 'Lettres à Malthus sur différents Sujets d'Economie Politiques,' 1820. 4, 'Cours Complet d'Economie Politique Pratique,' 6 vols. 1829. This in effect is the 'Traité' more amply and familiarly illustrated. The first and second works in the above list have been translated into English. Say is the author of some smaller works, one of which is entitled 'De l'Angleterre et des Anglais.'

SCA'EVOLA. There were many distinguished persons who bore this name.

QUINTUS MUCIUS SCAEVOLA was prætor in the year B.C. 215, and in the following year had the government of Sardinia. He may be the Quintus Mucius, a jurist, mentioned by Pomponius ('Dig., i. tit. 2, s. 37), if Mucius is the right reading there.

PUBLIUS MUCIUS SCAEVOLA, one of a family of jurists, was tribunus plebis B.C. 141, prætor B.C. 136, consul in the year B.C. 133, and in the year B.C. 131 he was Pontifex Maximus. Up to his time, says Cicero ('De Or., ii. 12), the events of every year were registered by the Pontifex Maximus, and such registers were the Annales Maximi. This Scaevola was a distinguished jurist, and also had the reputation of being an able orator and an honest man. Cicero speaks of his juridical writings, and Pomponius attributes ten works to him. Scaevola is cited in the 'Digest' several times. He was consul during the disturbances in which Tiberius Gracchus perished, and his conduct was marked by moderation.

QUINTUS MUCIUS SCAEVOLA, commonly called the Augur, was consul with L. Cæcilius Metellus in the year B.C. 117. He is said to have been the son of P. Mucius Scaevola, or Q. M. Scaevola, as he is sometimes called, who was consul B.C. 175, and grandson of Q. M. Scaevola who was prætor in the year B.C. 215. He was less distinguished himself as an orator than for his knowledge of the Roman law (Jus Civile). He was Cicero's master, but he was then an old man, and after his death Cicero attached himself to Quintus Mucius Scaevola, the pontifex. It is not known that he left any writings behind him, and accordingly he is not mentioned by Pomponius ('De Origine Juris,' 'Dig., i. tit. 2). He was the son-in-law of C. Lælius, and the father-in-law of the orator L. Crassus, and is one of the interlocutors in Cicero's treatise 'De Oratore' (lib. i.), of the treatise 'De Amicitia,' and in the treatise 'De Republica.'

QUINTUS MUCIUS SCAEVOLA, commonly called the Pontifex, to distinguish him from Q. M. Scaevola the Augur, was the son of Publius. He was the colleague of L. Crassus as tribunus plebis in the year B.C. 106, the year of Cicero's birth, ædile in B.C. 104, and consul in B.C. 95. As proconsul of the province of Asia, he distinguished himself by the wisdom and justice of his administration; and the Greeks commemorated his happy government by establishing a festival called Dies Mucia. He subsequently attained the dignity of Pontifex Maximus. He was a man of strict integrity and great ability; a distinguished orator, and still more eminent as a jurist. (Cic., 'De Or., i. 39.) After the death of the Augur, Cicero had the advantage of the society of the Pontifex, who formed many distinguished pupils, though he did not profess specially to give instruction in the law. C. Aquilius Gallus, one of the masters of Servius Sulpicius, was a pupil of this Scaevola. He perished in the consulship of the younger Marius, B.C. 82, being among those who were proscribed by him. The Pontifex was murdered in the temple of Vesta, where he had taken refuge, and the altar of the goddess was stained with his blood. (Flor., iii. 21; Cic., 'De Or., iii. 3.)

This Scaevola was the first Roman who attempted to systematise the Jus Civile, which he did in a work in eighteen books. This work is mentioned by Gellius (vii. 15). It is also cited in the 'Digest,' where the name of Mucius is often mentioned; but there are no extracts from it. The Muciana Cautio took its name from him. ('Dig., xxxv. tit. 1, s. 72, &c.) He also wrote a book of Definitions (*ῥηοι*), probably the first of the kind; and this is the oldest work from which any extracts with the author's name at the head were received into the 'Digest' (xli. tit. 1, s. 64; xliii. tit. 20, s. 8, &c.). The work on the Jus Civile was commented on by several subsequent jurists. Gaius (i. 188) speaks of certain books which he composed 'ex Quinto Mucio.'

SCA'EVOLA, QU. CERVI'DIUS, a Roman jurist, probably gave responsa in the time of Antoninus Pius (Dig. 34, tit. 1, s. 13); but he was certainly employed by Marcus Antoninus as a legal adviser (J. Capitolinus, 'Marcus,' 11; Dig. 36, tit. i, s. 22); and in his writings he speaks of the constitutions of Marcus and Verus, in terms which imply that they were then alive. Septimius Severus, afterwards emperor, and Papinian, were pupils of Cervidius, who probably died in the reign of Severus (Spartianus, 'Caracalla,' 8). His responsa were often very brief, expressed in a single word. (Dig. 17, tit. 1, s. 62); but the facts on which the opinion is given are clearly stated. His style has been blamed as obscure; but there is evidence of his great capacity, and he left a name behind him.

There are excerpts in the Digest of Justinian from his forty books of Digesta, six books of Responsa, twenty Libri Questionum, four

Libri Regularum, and one book Quæstionum publice tractarum, probably a book of decided cases. The Florentine Index also mentions a single book 'De Quæstione Familie,' but there is no excerpt from it in the Digest. There are 307 excerpts from the writings of Scaevola in the Digest.

Many of the Responsa of Scaevola appear twice, both in the Responsa and the Digesta. Conradi, followed by Blume, supposes that the Digesta contained a fuller statement of the matters which are briefly indicated in the Responsa, and were a kind of commentary to the Digesta. Puchta says that the passages in the Digesta do not show this; and that this relation is rather that of the Quæstiones to the Responsa: "the Quæstiones were devoted to the complete examination and justification of the opinions."

Claudius Tryphoninus and Paulus commented on Scaevola; and he is often cited by Marcianus, Tryphoninus, Ulpian, Paulus, and Modestinus. Scaevola commented on Julian and Ulpian Marcellus.

(Grotius, *Vite Jurisconsultorum*; Puchta, *Cursus*, &c., i. 453; Zimmern, *Geschichte des Röm. Privatrechts*, p. 361.)

SCALA, DELLA, or SCALIG'GERI, the name of a family of Verona, which acquired sovereign power over its native city in the 13th century, and afterwards extended its dominion over the neighbouring towns and territories. Like the Della Torre and the Visconti of Milan, the Della Scala belonged to the order of the nobility. They became party leaders during the factions which agitated the Italian cities in the middle ages, and their party having proved successful, they obtained the dignity of Podestà, or supreme magistracy, first for a term of years, afterwards during the life of the holder, and lastly as an office hereditary in their family, being confirmed in it by the sanction of the German emperors, who, in their quality of kings of Italy, although they had no direct dominion over any part of the country, appointed as their imperial vicars those chiefs who had most influence over their countrymen.

After the death of Eccelino da Romano, tyrant of Padua, Verona, and Vicenza, and the great Ghibeline leader in Northern Italy, the people of Verona elected for their podestà Mastino della Scala, about the year 1260. Mastino belonged to the Ghibeline party, which predominated at Verona. After having held office for five years, during which by his conduct he won the public approbation, Mastino was made by acclamation perpetual captain of the city. Being murdered by some private enemies in 1273, the citizens elected for his successor his son Albert, who was afterwards proclaimed lord of Vicenza, Feltre, and Belluno, by the citizens of those towns.

Albert died in 1297, and was succeeded by his eldest son Bartolommeo, who, dying three years after, was succeeded by his brother Alboino, a man of a peaceful temper, who, not thinking himself fit to rule alone in those turbulent times, took his younger brother, Can Francesco, a brave aspiring soldier, for his colleague, and some years later resigned to him the undivided sovereignty. Can Francesco della Scala, called the 'Great' by his contemporaries, was the most illustrious of his family. He was appointed captain of the league made by Verona, Mantua, Brescia, and other towns against the Marquis of Este, lord of Ferrara, who, being supported by the Anjous of Naples, aspired to extend his dominion over Lombardy. Can Francesco defeated him, and obliged him to withdraw to Ferrara. When Henry of Luxembourg, king of the Germans, came to Italy to be crowned emperor in 1311, Can Francesco joined him with a body of troops, and assisted him in subduing Brescia and other towns, which would not acknowledge the imperial authority, and he was rewarded by Henry appointing him his imperial vicar at Verona. Can Francesco, or Can Grande, as he was henceforth styled, became the acknowledged head of the Ghibeline party in Lombardy, like his contemporary Castruccio Castracani in Tuscany. The dominion of Can Grande extended over Verona, Vicenza, Feltre, Belluno, Este, Monselice, Cremona, and lastly, after a war which lasted several years, also over Padua—in short, over almost the whole extent of country which has been since called the Venetian territory, Venice at that time having but a strip of ground on the mainland bordering on the lagoons. The last acquisition of Can Grande was that of Treviso, which he obliged to open its gates to him in July 1329. He made his triumphal entrance into Treviso, but was a few days after seized by a violent fever, and died in the height of his success, at the age of thirty-nine, having been ruler of Verona for about nineteen years. Castruccio had died the year before, and thus the Ghibelines of Italy lost, nearly about the same time, their two most distinguished leaders.

Can Francesco della Scala acquired celebrity not only by his success as a warrior and a statesman, but by the encouragement which he gave to literature and the arts. His court, which was very splendid, was attended by poets, painters, and sculptors. Dante in his exile found for a time an asylum at the court of Della Scala, and he immortalised Can Francesco in his verse. Boccaccio also wrote of him as one of the most illustrious chiefs that Italy ever had, not only on account of his bravery in the field, but also for his abilities in council. He raised the fortress of Peschiera, on the shore of the Lake of Garda, as a defence on the side of Mantua and Milan.

Can Francesco was succeeded by his two nephews, Alberto and Mattino, who acted a conspicuous part in the wars of the Italian factions in the 14th century, fighting against the Visconti and the Venetians. Their descendants continued to rule till the year 1387, when Gian Galeazzo Visconti, duke of Milan, took possession of Verona,

having driven away Antonio della Scala, an illegitimate son of the last lord. After some more vicissitudes, Verona came into the possession of the Venetians in the year 1409.

SCALIGER, JULIUS CÆSAR, was born, according to the statement of his son, on the 23rd of April 1484 in the castle of Riva, near the Lago di Garda. The history of the descent and the early youth of Scaliger is involved in inextricable difficulties, as he himself at one period of his life made pretensions which, though supported by his son, are irreconcilable with other well-attested facts, and which were contradicted and ridiculed in his own lifetime by eminent contemporaries. His real name was Della Scala, and he pretended to be descended from the princely family of the Scalas of Verona. There is a patent of naturalisation, which in 1528 he requested and obtained from Francis I., king of France, in which he is called "Julius Cæsar della Scala de Bordone, doctor of physic, a native of Verona in Italy." This document, which would surely have mentioned his noble descent, if it had been known, shows either that his pretensions were without any foundation, or at least that he did not indulge in this vanity till at a more advanced period of life. Tiraboschi calls him the son of Benedetto Bordone, a native of Padua, who lived at Venice, carried on the trade of illuminator, and assumed the name of Scaliger, either because he had a scale for his sign, or because he lived in a street called Scala. According to Scaliger's own account, he had in his twelfth year been made a page to the Emperor Maximilian, whom he served for seventeen years, both in peace and war. Afterwards he retired to Ferrara, where he received a pension from the Duke of Ferrara. His parents had died in the meantime, and he now determined to abandon his military pursuits and to apply himself to study. He therefore went to Bologna with the intention of studying theology and of entering into the Franciscan order; but he soon gave up his theological studies, returned to the military profession, and served for some time in Piedmont under the French viceroy. At Turin he was persuaded by a physician to begin the study of physic, which he did in his leisure hours, and without leaving the army. About this time he also commenced learning Greek, of which he had hitherto been entirely ignorant. As he advanced, his delight in his new studies increased; and this, as well as frequent attacks of the gout, at length induced him to give up his military life, and to devote himself entirely to his favourite pursuits. In 1525 he accompanied Antonio de la Rovera, who had been made Bishop of Agen, to his new diocese, in the capacity of physician. The degree of doctor of physic, which is mentioned in the document above referred to, must have been obtained before this time, but in what university is uncertain, though it is generally supposed that he obtained it at Padua. It was at first his intention not to stay at Agen, but soon after his arrival there he fell in love with Andietta de Rogues, a young lady of a noble and wealthy family, whom he married. He now settled at Agen, where he lived until his death, on the 21st of October 1558. He continued the practice of physic, and at the same time prosecuted his scientific and literary studies.

Considering that Scaliger commenced his studies at so advanced a period of life, and considering the number as well as the value of his works, none of which were published before he had attained the age of forty-seven, it must be owned that he was one of the most extraordinary men of the age. He had a most tenacious memory and a sound understanding. His son praises him especially for his great love of truth, but he was of a very irritable temperament and excessively vain; and he treated every opponent or antagonist with the utmost contempt. Although he thus provoked many bitter enemies, he had many friends among his contemporaries; and scholars of subsequent ages, such as Lipsius, Casaubon, Vossius, Huet, and others, have bestowed on him the most extravagant eulogiums. His fame as a scholar, though very great in his own days, has in the more just appreciation of subsequent times been far eclipsed by that of his son Joseph.

The following is a list of his principal works:—*Commentarii in Hippocratis librum De Insomniis*, Græc. et Lat., 8vo, Lyon, 1538. *De Causis Linguae Latine Libri xviii.*, 4to, Lyon, 1540, reprinted at Geneva in 1580. This is the first great work which was written on the Latin language in modern times, and it is still valuable, though it contains a great many fanciful subtleties. *Exercitationum Exotericarum Liber Quintus decimus de Subtilitate ad Hieronymum Cardanum*, 4to, Paris, 1557. The fourteen preceding books, which had no relation to Cardanus, have never been published. *Poetices Libri Septem*, fol., Lyon, 1561. This work perhaps contributed most to the reputation of the author, though it shows that he possessed more grammatical knowledge than profound critical or creative powers. *In Theophrasti Libros Sex de Causis Plantarum Commentarii*, fol., Geneva, 1566; *Commentarii in Aristoteli adscriptos Libros Duos de Plantis*, Geneva, 1566; *Aristotelis Historiæ Animalium Liber Decimus, cum vers. et comment.*, 8vo, Lyon, 1584; *Animadversiones in Theophrasti Historias Plantarum*, 8vo, Lyon, 1584; *J. C. Scaligeri adv. Desid. Erasmus Orationes Duæ, Eloquentiæ Romanæ Vindiciæ, cum ejusdem Epistolis et Opusculis*, 4to, Toulouse, 1621. The first of these orations, which were directed against the work of Erasmus, entitled *Ciceronianus, sive de optimo Dicendi Genere*, was published at Paris in 1531, and appears to have been his earliest work. Scaliger also published a number of Latin poems, which however are of very little value. The style is often obscure and bombastic.

SCALIGER, JOSEPH JUSTUS, the son of Julius Cæsar Scaliger, was born on the 4th of August 1540, at Agen. He received his earliest instruction from his father. At the age of eleven he was sent with two of his brothers to the college of Bordeaux, where he applied himself chiefly to the study of the Latin language. After a stay of three years at Bordeaux he was compelled by the appearance of the plague to quit the place and return to Agen. His father now continued his education, and made him write every day a Latin essay on some historical subject, by which exercise the youth became most intimately acquainted with the Latin language. His father sometimes also made him transcribe some of his own poetical compositions, which seems to have inspired the youth with such a love of poetry, that at the age of sixteen he attempted to write a tragedy on the story of King Œdipus. After the death of his father, when he was nineteen years of age, he went to Paris, where he devoted himself principally to the study of Greek. At first he attended the lectures of Adrianus Turnebus, but when he found that he might make more rapid progress by private study, he confined himself to his room and began reading the Greek writers by himself. He commenced with Homer, and in the course of two years which he spent in his seclusion from the world he read nearly all the Greek authors both in verse and prose. He also turned his attention to Oriental languages, which he likewise learned by himself.

Respecting the years which succeeded this period of intense study, from about 1565 till 1593, we know very little of the life of Scaliger. It must have been during this time that he left the Church of Rome and became a Protestant, which was probably the reason why he did not obtain any public appointment in France. In 1593 he was invited to the chair of Belles-Lettres in the University of Leyden, where he spent the remainder of his life, devoting himself entirely to the elucidation of antiquity. He was one of that constellation of great scholars who are to this day remembered as the ornaments of the University of Leyden. Among his numerous pupils was Hugo Grotius, who enjoyed the especial friendship of Scaliger, and who was entirely guided by him in his studies. Scaliger's life in Holland presents scarcely any incidents, and we only know that, absorbed in his studies, he paid so little attention to matters of ordinary life, that he spent many days in his study without thinking of taking any food, and that he was sometimes in a state of absolute poverty. Several persons of distinction, who esteemed his talents and his learning, generously offered to extricate him from his difficulties, but his pride never allowed him to accept any present. He was never married. He seems to have inherited his father's character, for he was exceedingly proud, and, like his father, he treated his literary opponents with the most perfect contempt. He revived and defended the idle pretensions of his father respecting the illustrious origin of his family, in a letter addressed to Dausa, *De Vetustate et Splendore Gentis Scaligeranæ*. This letter was directed against Scioptius, and was full of the bitterest invectives against that scholar. Scaliger died of dropsy, on the 21st of January 1609.

As a critic Joseph Scaliger is pre-eminent, and there are very few scholars who can be compared with him. Some of his works even now excite our astonishment and admiration by the prodigious learning which they display, combined with an almost unparalleled acuteness and sagacity. Although in his verbal criticism and in his emendations and conjectures he is often too bold and too capricious, yet all that he has done bears the peculiar impress of his great genius, and he scarcely ever exposes himself to the charge of inaccuracy, from which his father was by no means free.

The greatest among the numerous works of Joseph Scaliger is *De Emendatione Temporum*, fol., Paris, 1583. A corrected and much improved edition of this work appeared at Geneva, fol., 1629. In this work Scaliger, for the first time, explained the Julian period in a satisfactory manner, and established a complete system of chronology founded on sound principles. Several errors which were detected in the work by his contemporaries, were afterwards corrected by Scaliger himself, in another work, entitled *Thesaurus Temporum, completens Eusebii Pamphili Chronicon cum Isagogicis Chronologiæ Canonibus*, the best edition of which is that published at Amsterdam, 2 vols fol., 1658. Among his other and less important works, there is a Latin translation of two centuries of Arabian proverbs, published at Leyden, 1623; his *Poemata*, 8vo, Leyden, 1615; and his *Epistolæ*, which were edited by Daniel Heinsius, at Leyden, 8vo, 1637. His poems have little merit, but his *Epistles* are very instructive, and also valuable for the literary history of his time. Scaliger also edited many ancient authors with emendations and annotations, and there are few ancient writers for whom he has not done something. His commentary on Varro, *De Lingua Latina*, was written when he was twenty years of age; it was published at Paris, 1565, and is reprinted in the Bipont edition of Varro. His edition of Theophrastus, *Cum Emendat. Jos. Scalig. et Is. Casaub. Lect.*, appeared at Heidelberg, 8vo, 1596; *M. Manilii Astronomicum*, 4to, Leyden, 1600; Catullus, Tibullus, and Propertius, 8vo, Paris, 1577. He also made emendations and wrote commentaries on Seneca the dramatist, Ausonius, Nonnus, Festus, and many other authors.

SCALIGERI. [SCALA DELLA.]

SCAMOZZI, VINCENZIO, was both a contemporary and fellow-countryman of Palladio, having been born in 1552 at Vicenza, where

his father, Giovanni Domenico, also practised as an architect. He was taught by his father the elementary part of his art, and then sent by him to Venice, where he is said to have studied under Palladio; yet this is exceedingly doubtful, and it is certain that in his writings Scamozzi is rather a detractor than an admirer of that master. Before leaving Vicenza he had given proofs of his abilities and taste in several designs for Count Verlati and others; and in 1569 he was employed to remedy the defects of S. Salvatore at Venice (destroyed by fire in 1471). At the age of twenty-two he wrote a treatise on perspective, wherein he entered at length into the subject of scene-painting. It was in 1579 that he first visited Rome, where the sight of the remains of antiquity filled him with admiration. He was most diligent in studying them, sparing neither expense nor personal trouble; and among other things of the kind, he made elaborate drawings of the baths of Antoninus and of Diocletian. Having thus occupied himself in that city for eighteen months, he proceeded to Naples, at which place and its environs he was equally diligent in exploring the vestiges of ancient buildings.

On his return home he resolved to fix himself at Venice, as offering a wider field to his ambition. His first occupation there was however with his pen, for, at the request of a bookseller, he wrote the explanations to a series of plates by Pittori, to which he prefixed three chapters relative to ancient Rome generally, a work which, although extolled by Maffei beyond its real merits, not undeservedly obtained for him credit with his contemporaries as one of the most erudite in his profession. The recent death of Sansovino and Palladio (1570 and 1580) were circumstances in his favour, and caused him to be looked forward to as their successor in the public esteem. Accordingly almost his very first work, after the monument to the Doge Niccolò da Ponte, was to complete the public library by the first-mentioned of those architects; he was afterwards similarly employed to finish one of Palladio's, namely, the Teatro Olimpico at Vicenza, to which he added the fixed scena, with its three avenues of buildings shown in perspective, but executed in relief. Although such kind of decoration is utterly unsuitable to the modern drama, and is anything but an improvement on painted scenery, it gave such satisfaction, that in 1588 he was employed by the Duke Vespasiano Gonzaga to erect a similar theatre at Sabbionetta, of which structure nothing now remains.

About this time a deputation being sent from the republic to congratulate Sigismund on his accession to the throne of Poland, Scamozzi availed himself of the opportunity offered him by his friend the senator Duodo of visiting that country, and also in the course of their route some of the principal cities of Germany. It was this journey that first suggested what continued to be afterwards a favourite object of his, namely, the work entitled 'Architettura Universale,' which he intended to be a sort of encyclopædia of the art, and to contain specimens of various styles and examples in different parts of Europe. Nor was this the only result of his journey, for on passing through Salzburgh he was introduced to the archbishop, by whom he was afterwards employed (1604) to design the cathedral of that city, which may be considered as his work, though not completed till 1628, and which is described by Temanza as one of the noblest temples of modern times, and greatly superior, as regards architecture alone, to St. Peter's. In the meanwhile his engagements at home were numerous, and, besides many noble private habitations erected by him both in the city and on the Venetian terra firma, he built several churches, among others that of San Niccolò di Tolentino, Venice (remarkable for having a Corinthian hexastyle diprostyle, subsequently added by Tirali), and SS. Simone e Guida. But his most important work, that which has chiefly contributed to his fame, is the stately range of building on the south side of St. Mark's Place, called the Procuratie Nuove, commenced by him in 1586. The design itself however may be said to belong nearly as much to Sansovino, at least to have been fixed by him, all the lower part as far as the entablature of the second order being in continuation of the façade of the adjoining public library; while the difference is that the excessively deep frieze and cornice of Sansovino's second order are moderated, and a third or Corinthian story added to the elevation. This last order has been considered by some to be the most elegant portion of the whole, but it is also objected to as destroying the general uniformity, in regard to height, of the buildings on three of the sides of the piazza. Scamozzi was almost overwhelmed with commissions and applications for designs. Among his other works are—the Palazzo Roberto Strozzi, Florence; the Palazzo Pretorio, Vicenza; ditto Bergamo; the Villa Duodo, and seven small churches or chapels at Monselice. He also made two designs for the Rialto bridge, one with three arches, the other with a single arch, but neither was adopted. Thus continually engaged, he had little leisure for his pen, and did not therefore complete his 'Architettura Universale,' which was to have been in ten books, but only six appeared, and those were published only a few months before his death, on August 7th 1616; two days before which he made a singular will, expressive of a most extraordinary solicitude for perpetuating his name, for having no surviving offspring, he there adopted Francesco Gregori, who died shortly after, and protracted litigation as to his successor under the will was the consequence. What renders such solicitude on the part of Scamozzi an inconsistency is that he speaks of himself as having acquired an imperishable name.

SCANDER-BEG, prince of Albania, whose real name was George

Castriota, was the son of John Castriota, one of the rulers of that country. He was born in 1404. His father having become a tributary to the Turks, Scander-beg, with three other brothers, was sent to the court of Murád II., who lodged them in his own palace, and had them educated in the Mohammedan religion, notwithstanding the solemn promise to the contrary given to their father. After the death of his three brothers, Scander-beg rose in favour with that sultan, who received him into his guard, promoted him, and gave him the appointment of Sanjac-beg, with the command of five thousand cavalry. On the death of his father in 1432, his family dominions were seized by Murád, who appointed a bashaw to govern them in his own name.

From that time Scander-beg formed the design of possessing himself of his principality. Having accompanied the Turkish army to Hungary, he entered into a secret arrangement with the celebrated Hunyade, waywode of Transylvania, and commander-in-chief of the combined Christian forces, and he contributed, by a sudden manœuvre of the forces under his command, to the defeat of the Turkish army on the plain of Nissa (10th of November 1443). Having, in the confusion resulting from the battle, penetrated into the tent of the Reis Effendi, he put him to death with his own hand, after compelling him to sign an order to the Turkish bashaw of Epirus, enjoining him to deliver Croia, the capital, and the surrounding districts to the bearer. Scander-beg left the camp with three hundred Albanians, appeared before Croia, massacred the Turkish garrison, and ascended the throne of his fathers, having previously renounced the Mohammedan religion. A long warfare ensued; but although frequently obliged to retire to the fastnesses of the mountains, Scander-beg renewed his attacks upon the first favourable occasion, and in this manner destroyed a vast number of his enemies. In 1444 he defeated in the Lower Dibra a considerable force which had been sent against him; and though in 1449 Murád took from him the important fortress of Sfetigrad, though he invested Croia in 1450, that powerful sultan was at last compelled to raise the siege and retire into his own dominions, where he died (at Adrianople) 5th of February 1451.

Mohammed II., who was Murád's successor, having proposed to Scander-beg terms of peace, which were accepted, that warrior, at the request of Pope Pius II., repaired to Italy, to the assistance of Ferdinand, king of Naples, who was closely besieged at Bari by John, count of Anjou. Not only did Scander-beg oblige this prince to raise the siege, but he greatly contributed to the victory which Ferdinand gained over his antagonist near Troia (18th of August 1462). The Venetians having declared war against the Turks, Scander-beg was induced by them to break the treaty by which he was bound, and to make an inroad into Mohammed's dominions. He was again successful, and defeated a considerable force which besieged Croia, the capital of his states. He was at length carried off by sickness at Liessa in the Venetian territory, on the 17th of January 1467, in the sixty-third year of his age, leaving a son of tender years, whose guardianship he entrusted to the republic of Venice. His death however was soon followed by the entire submission of Albania to the Turkish yoke.

Scander-beg was a great warrior; his enterprise and military skill constituted him one of the ablest generals of his day. Such were his personal strength and his courage in the field, that the Turks gave him the name of Iskander-beg (Prince Alexander). On the taking of Liessa, where his remains were discovered by the conquerors, the Turks dug up his bones and made them into amulets, under the impression that they would thus transfer his courage to them. There are various chronicles of Scander-beg: the principal and the best is that of Marino Barlesio, his contemporary, which appeared for the first time at Frankfurt, folio, 1537, under the title of 'De Vitâ et Moribus ac Rebus præcipuè adversus Turcas gestis Georgii Castrioti clarissimi Epirotarum Principis, qui propter celeberrima facinora Scanderbegus, hoc est Alexander Magnus, cognominatus fuit.' It was afterwards reprinted and translated into French and German. Another anonymous history had previously appeared at Rome in folio, 1537. T. M. Monardo published one in Italian, folio, Venice, 1591, which was translated into Portuguese and into Spanish. There are also 'Histoire de Scander-beg,' by Du Poncet, Paris, 1709; 'Scander-beg, ou les Aventures du Prince d'Albanie,' by Chevilly, ibid., 2 vols. 12mo, 1732, and two Latin poems on the history of Scander-beg, one by Kökert (4to, Lubec, 1643), the other by Busieres.

(Hammer Purgstall, *Geschichte des Osmanischen Reichs*, Pesth, 1827-35, vol. ii.; Hawkins, *History of the Ottoman Empire*, London, 1787, vol. i.)

SCAPULA, JOHN, was probably a native of Lausanne. He lived during the latter half of the 16th and the commencement of the 17th century, and at one period of his life he was employed at Paris in the printing establishment of Henry Stephens. The time of his death is unknown, but it is probable that in the year 1512 he was still alive. Scapula is known as the editor of a Greek dictionary, which, instead of gaining him credit, has drawn upon him the just and severe censure of all honest men. He was employed by Stephens at the time when that great scholar was printing his 'Thesaurus Lingue Græcæ,' which was published in 1752. After the publication of that work, Scapula appears to have left his employer, for in 1579 he published at Basel a 'Lexicon Græco-Latinum,' fol. This dictionary is in fact only an extract from or abridgement of the great work of Stephens. The

sale of the 'Thesaurus' was of course greatly diminished by the publication of an abridgement, and Stephens, who had spent almost all that he possessed upon his work, became involved in considerable difficulties. Scapula did not even acknowledge what he had done; on the contrary, he constantly endeavoured to conceal the source from which he had drawn. Some of his biographers have asserted that Scapula published his dictionary while the 'Thesaurus' was printing, an assertion which is wholly unfounded, for there is no edition earlier than that of 1579. Though Scapula injured Stephens, he did a great service to those students who could not afford to buy the expensive work of Stephens.

The dictionary of Scapula has frequently been reprinted. He himself published a second edition at Basel in 1589. Other reprints appeared in 1594, 1598, 1606, 1611, 1627, 1637. The Elzevirs of Amsterdam published, in 1652, a fine edition in fol. which was reprinted, in 1666, at Basel. The last editions are those of Glasgow, 2 vols. 4to, 1816, and of London, 4to, 1820, edited by Major. Another work of Scapula, 'Primogenia Voces, seu Radices Linguae Latinae,' was published at Paris, in 1612, 8vo.

SCARLATTI, ALESSANDRO and DOMENICO, father and son, persons of great celebrity in musical history, who flourished from the latter part of the 17th century till the middle of the 18th.

ALESSANDRO, founder of the Neapolitan school of music, was born at Naples in 1650, and though it is not known from whom he derived his early instruction, it is certain that he completed his studies under Carissimi, to whose notice he introduced himself, and whose favour he obtained by his performance on the harp, which was of the most finished kind. This acquaintance was formed at Rome, in which city, and also at Venice, Alessandro produced many compositions, both for the church and theatre, with uniform success. After passing some years in various parts of Italy, he finally settled in his native city, and devoted himself to his art, the improvement of which was his most anxious wish, and engaged a large share of his time. He at first turned his attention to the operatic overture, and soon gave a dramatic character to what till then had been without design and wretchedly meagre. He also is supposed to have originated violin accompaniments to airs, and likewise those symphonies, or ritornells, which afford variety and relieve the singer. The recitative 'obbligato' is also indebted to him for vast improvement; and the 'da capo,' or repetition of the first portion of an air, is ascribed to him, and continued long in use; though modern taste has abolished what, very frequently in vocal music, led to a gross violation of common sense.

The elder Scarlatti, we are told, produced two hundred masses, a hundred operas, and three thousand cantatas. He was, Dr. Burney says, author of the words of many of the last. The same writer adds, that he "found part of his (Scarlatti's) property among the stolen goods of all the best compositions of the first forty or fifty years of the last century." Very little of this amazing quantity was ever printed, and a still smaller portion is known, even to musical antiquaries, at the present day. Some of the cantatas were arranged as duets by Durante, his pupil. [DURANTE, FRANCISCO.] A clever madrigal for four sopranos and an alto is published in the second part of Martini's 'Saggio di Contrapunto'; and a fugue of his composition, in F minor, which, for scientific contrivance and beauty of effect, has few rivals, appears among the Harpsichord Lessons of his son. He was knighted at Rome by Christina, queen of Sweden, and there died in 1725.

DOMENICO SCARLATTI, was born in 1683. He inherited the prudence as well as the talent of his father; and as the parent had profited much by his connection with so great a master as Carissimi, so the son derived at least equal advantages from his acquaintance with the first of musicians, Handel, whose friendship he acquired while both were residing at Venice. So much attached was the young Italian to the celebrated Saxon, that he followed him to Rome, and only quitted his friend on receiving an appointment in the service of the king of Portugal. He afterwards returned to the papal city; but on the death of his father, proceeded to Naples, where he formed an intimacy, beneficial to both, with Hasse, an opera composer of the first rank. [HASSE, ADOLPH.] He finally, in 1735, accepted an invitation to Madrid, as master of the royal chapel and teacher to the queen, who had been his pupil at Lisbon. He died in that city in 1751.

Domenico left many operas and other compositions; but his 42 'Suites de Pièces pour le Clavecin' is the work by which he is now known, and on which his reputation solely rests. To execute these was, during nearly half a century, the object at which all ambitious harpsichord players aimed: to perform them well was considered a decisive proof of practical excellence; and even now it requires a nimble and brilliant finger to do them justice, though in point of style they are thoroughly obsolete, are quite unsuited to the nature of the pianoforte, and, indeed, are considered rather as musical curiosities than as fit subjects for study, even for the professional musician. We must however except the two fugues forming part of the work, which, for every good quality that distinguishes the kind of composition, have never yet been surpassed, and must always be admired by those who have acquired a taste for this elaborate species of harmony. Domenico Scarlatti left a son, GIUSEPPE, born at Naples in 1718, who composed some harpsichord music, and many Italian operas, all of which were popular in their day; and some of the latter were pro-

duced at the King's Theatre in London; but not a single piece of his music ever came under our view. He died at Vienna in 1776.

SCARLETT, JAMES, [ABINGER, LORD.]

SCARPA, ANTONIO, was born at La Motta, a small village of Friuli, in 1748. His parents were persons in humble life, and he was indebted to a distant relation for the means of commencing his studies, while yet very young, at the University of Padua. The death of his early benefactor soon left him dependent on his own resources; but he continued to pursue his studies with such diligence that he became distinguished above his fellows, and was honoured with the esteem and friendship of the illustrious Morgagni.

In the year 1772 Scarpa's acquirements had become so well known, that he was selected as the most fit person to fill the chair of anatomy in the university of Modena, which was then re-established. Here he published his first work—a treatise on the structure of the internal ear. The grand-duke of Modena, Francis III., to whom this book had been dedicated, nominated Scarpa in the same year to the post of surgeon-in-chief to the military hospital in his capital. Success abated nothing of Scarpa's habits of diligence. Having published another work, on the structure of the nerves, he set out on a journey to France, Holland, and England, during which he made the acquaintance of many eminent men. During his stay in Paris the offer of the anatomical chair in the university of Pavia was made to him by the Emperor Joseph II. A feeling of gratitude to his early patron induced Scarpa to decline this flattering offer until he was urged to accept it by the Duke of Modena himself. He was eventually installed in his chair at Pavia in the year 1783. His researches into the anatomy of the organs of smell and hearing, and his treatises on the nerves of the heart, and on the minute anatomy of bone, followed each other in rapid succession, and showed his unwearied assiduity. These works, and especially that on the nerves of the heart, which decided in the affirmative the long-disputed question whether the heart is supplied with nerves, had procured for Scarpa before the end of the 18th century a European reputation. But he still continued those labours to which he was so much devoted. In 1801 he published a valuable treatise on the diseases of the eye; and in 1804 his observations on the cure of aneurism appeared, to which a question proposed some years previously by the Parisian Academy of Medicine had given occasion. In 1809 he published a splendid work on hernia, which raised his reputation to the highest point. Three years afterwards he gave up the labour of public teaching, but received in 1814 the honourable appointment of Director of the Medical Faculty of Pavia. His suggestions for an improved system of medical education were not attended to, and disgust led him to resign this post, and about the same time he retired from practice. He followed his old pursuits however with undiminished energy in retirement, and it is to this period of his life that we owe some most valuable remarks on the operation for stone, as well as many other surgical tracts. The collection of these minor treatises was one of the last labours of his life. He pursued it, though suffering for some years under almost total blindness, and the publication of the third and concluding volume in 1832 preceded his death by only a few months.

In addition to his profound knowledge as an anatomist, Scarpa possessed unrivalled skill as a draughtsman—a talent that contributed greatly to the success of his works. His industry was indefatigable, and a bare enumeration of the titles of his works would occupy nearly a column of this Cyclopædia. All that he wrote had a definite practical aim, and hence no lapse of time will render his labours useless or cause his name to be forgotten. In point of industry he has been compared to Cuvier, and, like him, he did not confine his investigations to one department of science. Even medicine and the kindred sciences did not engross all of Scarpa's time. He was an elegant scholar, a man of great taste in the fine arts, as well as thoroughly skilled in agriculture, and a passionate lover of the chase. He was a member of the Institute of France, and of most of the learned societies of Europe; and he was honoured even by Napoleon I., who seems to have respected his devoted loyalty to the Austrian family, as well as by the house of Austria itself.

In person Scarpa was about the middle size, of very gentlemanly deportment, though not without a degree of reserve and austerity towards strangers, but of a disposition so amiable that he made friends of all who knew him. After several years of severe suffering from a calculous disorder, which terminated fatally, by inducing inflammation of the bladder, Scarpa died at Pavia on the 30th of October 1832.

A list of Scarpa's works, many of which have been translated into English, is appended to a sketch of his life in the 'Archives Générales de Médecine' for March 1833. A fuller biography is given in the 'Annali Universali di Medicina' for November 1832.

SCARRON, PAUL, a celebrated French burlesque writer, was born at Paris in or about 1610 of an ancient family, and to the inheritance of wealth, until an artful stepmother supplanted him in his father's affections, and finally deprived him of his inheritance and reduced him to poverty. Exiled from home, young Scarron purchased his restoration to favour by entering upon an ecclesiastical life, for which his character and habits were ill suited, and in which he never proceeded beyond the introductory degrees. For some years he indulged in gross and scandalous debauchery, in which at the age of twenty-seven he was stopped by the results of a singular extravagance. Being at Mans, where he held a canonry, during the Carnival, and desirous of sharing

the gaieties of the season, which he could not do consistently with his character as a churchman, he and three friends hit on the device of covering themselves with honey, and rolling in feathers. Thus plumed they entered the town; but the joke was thought too strong even for Carnival licence, and being assaulted and plucked, the unfeathered bipeds were fain to escape by jumping into the Sarthe, and hiding in the rushes. The other three died in consequence of this adventure; and Scarron himself contracted maladies from cold and exposure which rendered him for the rest of his life, to use his own phrase, an abridgment ('raccourci') of human suffering.

Disease and pain could not however subdue his lively spirit, and the rest of his life was spent in ministering by his writings and conversation to the amusement of the courtly and the gay, to whom his house became a rendezvous; and not being troubled with an over-scrupulous delicacy, he obtained both from private liberality and court favour the means of leading an easy and expensive life. In 1652 he became acquainted with Mademoiselle d'Aubigné (afterwards Madame de Maintenon), then in a state of poverty and dependence. His heart, capable, notwithstanding its levity, of noble emotions, was touched by her merit and her distress; and with a delicate and disinterested generosity he offered to her the choice either of entering a convent at his expense, or of sharing his precarious fortunes as his wife. She chose the latter; and chastened by her influence, the society of his house, always a favourite resort of the wits, became more select, but still more brilliant. Meanwhile his fortune became smaller and smaller; for on his marriage he had lost his canonry, and his other chief dependence, the profit arising from the sale of his works, diminished greatly towards the end of his life. This however, like all other evils, he bore with unflinching gaiety; and his last days were only troubled by anxiety for the prospects of his wife, whose conduct in a trying situation had been irreproachable, and for whom he had conceived a high affection and esteem. [MAINTENON.] He died October 14, 1660; and his last words were, "I could not have supposed it so easy to make a joke of death."

One cannot but sympathise with a man who bore great sufferings with such unconquerable cheerfulness; and that there was much to love in Scarron's libertine and thoughtless character is proved by the affection of a large circle of friends, including many of the most distinguished characters of the time. His works bear the impress of his mind: witty, lively, unlaboured, and unrefined, they were despised by the critic Boileau, but favourites on the stage and with the people. The plots of his comedies were mostly borrowed from the Spanish; they are slight, irregular, and farcical; but they made people laugh. His collected works have been published in various editions. The chief of them are—'L'Eneide Travestie,' 8 books, continued by Moreau de Bruzy; Comedies; 'Le Roman Comique,' the most lasting of his works; 'Nouvelles Espagnoles,' translated from the Spanish; and his Letters. Most of Scarron's works have been translated into English; some by the facetious (to give him the usual epithet) Tom Brown, and the 'Roman Comique' by Oliver Goldsmith.

SCAURUS is the cognomen of a branch of the patrician gens of the Æmili, but it was also borne by other families, such as the Aurelii. The house of the Æmili Scauri did not attain high honours until the latter period of the republic, and there are only two members of it who have acquired reputation in the history of Rome, M. Æmilius Scaurus, the princeps senatus, who was consul in B.C. 115, and his son, who bore the same name. The first of the family mentioned in history is L. Æmilius Scaurus, who had the command of a part of the fleet in the war against Antiochus, B.C. 190. (Liv., xxxvii. 31.)

M. ÆMILIUS SCAURUS, the princeps senatus, was born in B.C. 163. His father, though a patrician, was poor, and carried on the business of a charcoal merchant (carbonarium negotium), (Aurel. Vict., 'De Vir. Ill.,' c. 72); and when he died, the son, for want of means, hesitated whether he should devote himself to public affairs or engage in some lucrative business. He decided upon the former. He first distinguished himself as a soldier in Spain, and afterwards (B.C. 126) he served under L. Aurelius Orestes in Sardinia. A few years afterwards (B.C. 123), when he obtained the office of curule ædile, he was not able to exhibit to the people the games customary on that occasion, but he made up this deficiency by a just and punctual fulfilment of the duties of his office. In the year B.C. 120 he was prætor urbanus, and his coins, on which the head of Apollo is represented, probably belong to this year, and refer to the Ludi Apollinares, the celebration of which was always conducted by the prætor urbanus. At the time when Hiempsal sought help at Rome against Jugurtha, Scaurus was among the first who urged the necessity of punishing the usurper, and did not, like many others, accept the bribes that were offered to him. This conduct however is attributed by Sallust ('Jug.,' 15) not to his love of justice, but to his fear of detection; and this opinion is sufficiently confirmed by his subsequent conduct in Africa (Sallust, 'Jug.,' 29) and on other occasions. In the year B.C. 116 he offered himself as a candidate for the consulship, but without success. (Cic., 'Pro Muren.,' 17.) In the following year however he not only obtained the consulship, but in the course of the same year he was made princeps senatus. During his consulship he carried two laws, one a Lex Sumtuaria, and another respecting the suffrage of freedmen; and he also triumphed over the Ligurians and several Alpine tribes.

In B.C. 109 Scaurus was censor with Livius Drusus, and in this capacity he restored the Mulvian bridge and formed the Via Æmilia,

which ran past Pisa and Luna to Dertona. When his colleague died, Scaurus, according to custom, should have laid down his office; but he refused, until the tribunes threatened him with imprisonment. In B.C. 107 Scaurus was made consul a second time. His unsuccessful competitor, P. Rutilius, brought a charge of bribery and corruption ('ambitus') against him; but he was acquitted, and then brought the same charge against his adversary. (Cic., 'Brut.,' 30; 'De Orat.,' ii. 69.) Some years afterwards one of his sons took part in the unfortunate campaign against the Cimbri on the Athesis (Adige), under Quintus Catulus; and when he with several others escaped to Rome, his father so severely reproached him for his cowardice that the young man put an end to his life. (Valer. Max., v. 8, 4.) In B.C. 100 Scaurus received the office of præfectus annonæ, of which the senate had deprived L. Saturninus, and in the ensuing mutiny Scaurus defended the senatorial party. (Cic., 'Pro Rabir.,' 7.) During the latter years of his life he was much harassed by his personal enemies, though their charges, especially those which referred to his avarice, may not have been unfounded. At the time when he was a member of the college of augurs he refused to admit Cn. Domitius Ænobarbus into the college, and was therefore accused by him of having caused the neglect of the sacra of the Roman people at Lanuvium. Scaurus escaped punishment, though with great difficulty. (Ascon., 'In Scaurian,' p. 21, Orelli.) A short time afterwards Q. Servilius Cæpio brought against him the charge of having enriched himself in an unlawful manner during an embassy in Asia, but Scaurus again escaped by bringing another accusation against Cæpio. The latter however, to avenge himself, in the year B.C. 90 induced the tribune Q. Varius to accuse Scaurus of having instigated the Italian allies to take up arms; but the bold manner in which Scaurus denied the charge induced Varius to withdraw his accusation. (Aurel. Vict., c.; Ascon., c., p. 22.) It must have been soon after this event that Scaurus died, for we know that in the year B.C. 88 his widow became the wife of Sulla.

If we were to judge of Scaurus according to the opinion expressed by Cicero in several of his works, we must consider him one of the first of the Romans: Cicero at least considered him as the greatest man of his age. This partiality of Cicero for Scaurus arose partly from both of them belonging to the aristocratical party, and partly from the circumstance that Cicero when a youth had been introduced into his house, and the impression which the grave and proud aristocrat then made upon the young man was never effaced. Scaurus possessed some of the stern virtues of an ancient Roman, and, though he was an inflexible aristocrat, he enjoyed the highest esteem of the people as well as of the senate, which is shown from the fact that all the charges brought against him fell to the ground. Although originally poor, he had in the latter years of his life amassed immense wealth. The character which Sallust gives of him is that of a "homo nobilis, impiger, factiosus, avidus potentie, honoris, divitiarum, ceterum vitia sua callide occultans;" and it was undoubtedly by the appearance of sincerity and integrity which he kept up throughout his life in such a masterly manner, that he gained the admiration of so many of his contemporaries. Scaurus also distinguished himself as an orator (Cic., 'Brut.,' 29, 30), and wrote a work in three books containing the history of his own life, which however is now lost.

M. ÆMILIUS SCAURUS, son of the former, and afterwards son-in-law of Sulla, inherited only the bad qualities of his father. He increased his wealth during the proscriptions of Sulla; and during the war against Mithridates, when he served as quæstor in the camp of Pompey, he disgraced his name by accepting bribes for declaring himself in favour of Aristobulus against Hyrcanus in Jerusalem. Pompey however gave him the province of Syria with three legions, and here he remained until B.C. 59. During this time he made a plundering inroad into the peaceful country of Aretas, who could only prevent Scaurus from committing further robberies by the enormous bribe of 300 talents. (Joseph., 'Ant. Jud.,' xiv. 5.) After his return to Rome he obtained the curule ædileship, in the year in which P. Clodius was tribune, that is, B.C. 58. (Cic., 'Pro Sext.,' 54.) The games which he exhibited on this occasion far surpassed everything which the Romans had seen (Plin., 'Hist. Nat.,' xxxvi. 15), and involved him greatly in debt. (Ascon., 'Argum. ad Scaurian.') Soon after this he obtained the office of prætor, and in B.C. 35, during his administration of Sardinia, he extorted exorbitant sums from the inhabitants, in order to enable him to purchase the votes in the approaching election for the consulship. But when he came forward as a candidate the Sardinians, through the person of the tribune P. Valerius Triarius, brought against him the charge of repetundæ, and other crimes were at the same time laid to his charge (B.C. 34). His position was dangerous in the highest degree. He was defended by six advocates, and among them Hortensius and Cicero. A great part of the speech which the latter made for him is still extant. But the exertions of his friends, his own tears and lamentations, and the remembrance of his father, induced the judges to acquit him. A few days afterwards he was accused of ambitus, and although Cicero defended him again, he was condemned, and went into exile.

M. Æmilius Scaurus the Younger is one of the worst specimens of Roman nobles towards the end of the republic, and his whole life is one uninterrupted series of crimes. He was despised by all good men, and gained the admiration of the populace only by his unbounded extravagance, for which he indemnified himself by plundering foreign

countries. Notwithstanding all this, Cicero twice undertook the defence of this unprincipled man. It may be that Cicero's admiration for Scæurus the father induced him to attempt to save the name of Scæurus from disgrace. What Horace ('Carm.,' i. 12, 37) means in reckoning the Scæuri among the greatest men of the republic, is wholly inconceivable.

M. ÆMILIUS SCAURUS, a son of the former, betrayed Sext. Pompeius, his own brother-in-law, in Asia, to the generals of Antony. After the battle of Actium he was taken prisoner, but pardoned for the sake of his mother Mucia. (Ascon., c.; Dion. Cass., li. 2.)

MAMERCUS SCAURUS, a son of the former, and grandson of M. Æmilius Scæurus the Younger, was a good orator and poet, but a man of the most dissolute conduct. (Tacit., 'Annal.,' vi. 29; Dion. Cass., lviii. 24; Senec., 'De Benef.,' iv. 31.) In the reign of Tiberius he was accused of high-treason, and in the same reign (A.D. 34) of adultery with Livia. These charges may have been unfounded, but the real cause of his persecutions was some verses against the emperor, which his enemy Macro had inserted in one of the tragedies of Scæurus. To escape further persecution he put an end to his life. Seneca ('Suasor.,' 2) calls him the last of the Scæuri.

SCHADOW, JOHANN GOTTFRIED, an eminent German sculptor, was born at Berlin in 1764. Passionately fond of art when a boy, he was yet unable, owing to the poverty of his father, to obtain any instruction until a sculptor kindly offered to teach him to draw. He soon mastered the rudiments of art, and eventually determined to devote himself to his teacher's profession. But having formed an attachment to a young lady, he fled with her in his twenty-first year to Vienna, and there married her. The event proved the commencement of his good fortune; for his father-in-law not only forgave the young couple, but furnished funds wherewith Schadow might proceed to Italy to complete his studies. He remained at Rome from 1785 to 1788, chiefly occupied in the study of the antique. He then returned to Berlin and soon found ample patronage. The first important work executed by him after his return was the monument to Count Von der Mark, natural son of Frederick William II., erected in 1790 in the church of St. Dorothy at Berlin. Among other great works with which his chisel has adorned Germany are the colossal statue of General Ziethen in hussar's uniform; the equestrian statue of Frederick the Great at Stettin; a life-size marble group of Queen Luise of Prussia, and her sister the Duchess of Cumberland; a statue of Duke Leopold of Dessau for the Lustgarten at Berlin; an equestrian statue of Field-Marshal Blücher at Rostock; the monumental statue of Tauenstein at Breslau; that of Luther at Wittenberg; the quadriga on the Brandenburg Gate; and the sculpture on the Mint at Berlin: he also executed a considerable number of portrait busts of his more eminent countrymen.

For many years before his death Schadow was regarded as the patriarch of the modern school of sculpture in Germany: as an evidence of the honour in which he was held, it deserves to be mentioned, that whilst the old man still lived, the street in which he dwelt in Berlin was called by his name. Schadow was one of the very first of his countrymen to break through the classic conventionalisms of his predecessors, and, without departing from the sober dignity of sculptural style, to add a more forcible expression of character, and a stricter adherence to the actual model in attitude as well as in drapery. His great excellence lay in portrait, and he had ample opportunities of putting forth his powers. Appointed professor in the Academy of the Fine Arts at Berlin some time prior to the close of the 18th century, he from 1822 to his death held the office of director of that institution, and among those who were successively his pupils are a large proportion of the best sculptors of Germany, including Rauch, Dannecker, Tieck, Zauner, &c., in most of whose works evident signs of his influence may be traced. He died at Berlin January 26, 1850. Schadow has enriched the literature of art with the following works: 'Wittenberg's Denkmäler der Bildnerei, Baukunst und Malerei, mit historischen und artistischen Erläuterungen' ('Monuments of statuary Architecture and Painting, with historical and artistic illustrations'), Wittenberg, 4to, 1825; 'Polyklet, oder von den Massen des Menschen nach dem Geschlechte und Alter, mit Angabe der wirklichen Naturgrösse nach dem Rheinländischen Zollfaden, und Abhandlung von dem Unterschiede der Gesichtszüge und Kopfbildung der Völker des Erdbodens' ('Polyklet, or the Groups of Mankind, according to their Races and Periods, with an Appendix on their natural Size according to the Rhenish standard, and an Essay on the Distinction of Features and Forms of the Head among the Peoples of the Earth'), Berlin, 4to, 1834; and 'Nationalphysiognomien oder Beobachtungen über den Unterschied der Gesichtszüge und die äussere Gestaltung des Menschlichen Kopfes in Umrissen bildlich dargestellt' ('National Physiognomy, or Observations upon the Distinction of the Features and of the external form of Human Heads, represented in Typical Outlines'), Berlin, 4to, 1835.

RUDOLF SCHADOW, his eldest son, born in 1785, early displayed a decided genius in his father's art. Trained first under the immediate care of his father, and then at Rome enjoying the advice and friendship of Thorwaldsen and Canova, and the stimulating companionship of the band of young German painters, who in the early part of this century set themselves with so much zeal and perseverance to the task of regenerating art in their native land, Rudolf Schadow gave

promise of a career of more than common success. He died however before he had accomplished much at Rome on the 31st of January 1822. Like his father he was skilful in portrait-busts, and he executed some very beautiful statues—among others the well-known 'Girl fastening her Sandal,' in the Glyptothek at Munich, and the equally well-known 'Filatrice,' of which there is a duplicate at Chateworth; he also produced some excellent bas-reliefs.

\* FRIEDRICH WILHELM VON SCHADOW-GODENHAUS, the second son of J. G. Schadow, and one of the most eminent historical and portrait painters of Germany, was born at Berlin on the 6th of September 1789. Left to follow the bent of his own strong inclination he went when young to Rome, and joined himself with Veith, Schnorr, and other young German art-students, to the school forming under Cornelius and Overbeck, of which a notice will be found under the names of those two great painters [CORNELIUS, PETER VON; OVERBECK, FRIEDRICH]. Wilhelm Schadow adopting in all their fulness the views on art propounded by Friedrich Schlegel, attracted the particular notice of that eminent critic, who endeavoured to bring his peculiar abilities into notice. In the exhibitions of those German artists at Rome the works of Wilhelm Schadow were much admired. He was one of the number of Overbeck's followers who with him abjured Lutheranism and passed over to the Romish Church.

On his return to Berlin Wilhelm Schadow was appointed professor in the Academy of the Fine Arts in that city, and soon gathered about him numerous attached scholars. He likewise gained considerable celebrity by the pictures he produced, especially by that of the Evangelists now in the Werderschen church in Berlin. When however Cornelius in 1826 removed from Düsseldorf to Munich, Schadow left Berlin to succeed him as director of the Düsseldorf Academy, whither his Berlin scholars followed him, and where he quickly found himself at the head of a flourishing school. Here for some twenty years he laboured, building up a school of art, founded like those of Overbeck and Cornelius on the early Italian and German masters of religious art, yet striving "to reproduce from the bosom of antiquity fresh, living and blooming, a new art meet for the new time," and embracing in its scope genial homely subjects, and landscapes, as well as the higher class of historical and poetical works. From this Düsseldorf school have proceeded many of the ablest and most brilliant of living German painters, including among others such men as Lessing, Hubner, Hildebrandt, Schröter, &c., and high as Schadow's name stands as a painter it may be questioned whether his reputation is not still higher as a teacher. In acknowledgment of his service in elevating the Düsseldorf Academy to so distinguished a position among the art academies of Europe, he was ennobled by the King of Prussia in 1843, when, besides the prefix Von, he added the name of his estate, Godenhaus, to his family name. Von Schadow's pictures are mostly found in Düsseldorf and Berlin, but one of his best works, the 'Wise and Foolish Virgins,' is in the Museum at Frankfurt-on-the-Main.

SCHAFARIK. [SAFARIK, PAL JOZSEF.]

SCHALCKEN, GODFREY, was born at Dort, in 1643. His father, who was rector of the college in that town, intended him for one of the learned professions; but finding that he had a decided inclination to painting, he placed him under Solomon van Hoogstraten. He was afterwards for several years a pupil of Gerard Douw, whose style and manner of handling he very successfully imitated in small pictures of domestic scenes, chiefly represented by candlelight. After leaving Douw, he attempted to elevate his style by studying the works of Rembrandt, but finding himself unequal to the task, he returned to his original manner, and his pictures were eagerly bought. He painted in a variety of manners, but he was most eminently successful in candlelight pieces.

Some English gentlemen encouraged him to visit England, where he met with great success, till he attempted portraits on a large scale, in which he proved so inferior to Kneller, that he injured his reputation; but happily he soon became sensible of his error, and again painted on a small scale. It is to be regretted that though in his pencilling he is almost equal to Mieris or Vanderwerf, he is often incorrect in his drawing of the figure, and he also appears to have copied his objects without selection; hence in his portraits of women he was not so successful as in those of men. The subjects of his male pictures are well composed. On leaving England, he retired to the Hague, where he practised with great success till his death in 1706. There are three capital pictures by this artist in the Royal collection.

SCHATZ, GEORGE, born at Gotha, November 1, 1763, was a German writer deservedly esteemed in his day both as an original writer and a critic. Being of a delicate constitution, he preferred books to the society and amusements of other boys of his age; but although devoted to reading, and to a species of it seldom taken up by the young, he could not submit to formal study. He therefore gained little by his residence at the University of Jena, where it was intended he should apply himself to jurisprudence, but he occupied himself with Italian literature and poetry; and planned a translation of Tasso, and another of Macchiavelli's 'History of Florence,' which last he afterwards nearly completed. The death of his father left him at liberty to return to Gotha, where he thenceforth almost continually resided. He now set about diligently studying almost every European language and literature, in order to become acquainted with their character and with the best writers and the chief productions in

them. By this means he acquired valuable and extensive stores of reading, which enabled him to supply a number of excellent essays and papers to different literary journals, including those on Ereilla and Camoens, in the supplement to Sulzer's 'Theorie der Schönen Künste.' While his more finished pieces of criticism of that kind possess a permanent interest, his 'reviews' on the productions of the day were calculated to serve the cause of good taste, and generally displayed talent, shrewdness, and humour.

His original productions are not many, neither do they belong to the highest species of poetry. Nevertheless in his prose fables he is second only to Lessing, while in his sonnets and madrigals he shows himself rather the rival than the imitator of Petrarch. Many of his minor pieces are indeed mere trifles, but are distinguished by that captivating charm of manner which frequently constitutes almost the sole difference between prosy rhyming and highly wrought poetry. That he should have executed comparatively so little, while gifted with powers to excel, ceases to be matter of astonishment, when it is considered that he died in his thirty-second year, March 3, 1795.

SCHÄUFFELEIN, HANS L. [SCHEUFFELIN, HANS.]

SCHÉELE, CHARLES WILLIAM, an illustrious chemist, who was born at Stralsund in Pomerania, in December, 1742, where his father was a tradesman. He was educated first at a private academy in his native town, and afterwards in a public school. Having a desire to study pharmacy, he was apprenticed to an apothecary at Göttingburg, with whom he remained eight years, during which period he acquired much valuable chemical information. In 1773 he removed to Upsal, where he became acquainted with Bergman, who became his friend and patron, and Scheele's publication entitled 'Chemical Observations and Experiments on Air and Fire' is prefaced by an introduction from the pen of Bergman. Observing that fire could not be maintained without the presence of air, Scheele turned his attention to its analysis; and he found that what was then called liver of sulphur and some other substances occasioned a diminution of the atmospheric air to which they were exposed, to about four-fifths of its original volume. He afterwards obtained oxygen gas, or, as he called it, 'empyreal air,' by decomposing nitric acid, and by other processes; and he showed that this air was totally absorbable by liver of sulphur, and that upon adding as much of this gas to the residuum of the air which had been acted upon by liver of sulphur as had been absorbed by it, atmospheric air was reproduced. He found that the flame of burning hydrogen gas produced a similar diminution in the bulk of the air to that occasioned by the action of liver of sulphur.

It will be observed that, like Priestley, he discovered oxygen gas; and though not so early, yet, as Priestley himself admits, without any knowledge of what he had previously achieved.

Another and most important discovery which we owe to the labours of Scheele, is the elementary gaseous body now called chlorine, but by him named dephlogisticated marine acid. If we substitute, as has been very commonly done, hydrogen for phlogiston, the views of the discoverer will be perfectly intelligible and quite correct.

One of Scheele's first discoveries was that of tartaric acid, and he pointed out the mode of preparation, and this, with slight alterations, is still adopted: this was in 1770, and in the following year his paper on fluoric acid appeared in the Memoirs of the Stockholm Academy. He at first erroneously supposed that the silica which he obtained in the operation of preparing this acid was a compound of fluoric acid and water; but when the inaccuracy of this opinion was proved by other experiments, he gave it up.

In 1774 his experiments in manganese appeared in the Memoirs above mentioned, and it was during his researches on this metal that he discovered two bodies not previously known, namely, chlorine, already mentioned, and the earthy substance barytes. In the following year he proposed a new method of preparing benzoic acid, and also published an essay on arsenic and its acid; and a few years afterwards he made known the preparation of arsenite of copper, since largely employed as a pigment under the name of Scheele's or mineral green. In subsequent years he published important papers on molybdena and plumbago; on milk, and the lactic acid which it contains when sour; and also on the metal tungsten.

In 1782 his experiments on Prussian blue appeared: these were instituted for the purpose of discovering the nature of the colouring-matter, and they display great ingenuity, and sagacity in an uncommon degree. It resulted from these researches that the Prussian acid, or the colouring principle, was a compound of azote and carbon.

He pointed out, in 1784, a process for preparing citric acid in a pure crystalline form; and not long afterwards he described processes by which malic and gallic acids might be obtained in a state of purity.

These are the most important of Scheele's discoveries; and, with scarcely any other exception than perhaps Priestley, no person has pointed out so many new substances. It is to be observed that his labours were conducted under very disadvantageous circumstances, and during a life of short continuance, for he died at the early age of forty-four years, at Köping near Stockholm, in 1786.

SCHEEMAKERS, PETER, a Flemish sculptor, who obtained great celebrity in England. He was born at Antwerp in 1691, and he was the pupil of his father and a sculptor of the name of Delvaux. While still young he visited Denmark, where he worked as a journeyman. About the year 1728 he walked to Rome, and he was then so poor

that he was forced to sell a considerable portion of his clothes to obtain subsistence. From Rome, after only a short stay, Scheemakers journeyed again, the greater part of the way on foot, to England, and here he obtained considerable employment; but he paid a second visit to Rome, and after a two years' residence there he settled about 1735 for many years in England. He lived in Old Palace-yard, Westminster, until 1741, when he removed to Vine Street, Piccadilly, when he became the rival of Rysbrack and Roubiliac, and executed many important works, including some of the principal monuments in Westminster Abbey. The time of his death is not known, but according to his pupil Nollekens, as related by Smith, he returned to Antwerp in 1770, and there soon after died. Two sales however of his effects took place in Covent Garden in 1756 and 1757. Among the articles sold was a beautiful small copy in marble of the Laocoon, which was bought by the Earl of Lincoln: a good mould was taken from it by a figure-maker of the name of Vevini, from which excellent casts were made. Scheemakers' works are very numerous; they are elaborate in design and costume, but possess few of the higher qualities of the art; the marble is always remarkably well worked. There are monuments by him in Westminster Abbey to Shakspeare; Dryden; George, Duke of Albemarle; John Sheffield, Duke of Buckingham; Admirals Watson, Sir C. Wager, and Sir J. Balchen; Commander Lord Aubrey Beaulieu; and Doctors Chamberlin, Mead, and Woodward. He made also the statue of Sir John Barnard, in the old Royal Exchange; the statues in the India House of Admiral Pocock, Major Lawrence, and Lord Clive; the bronze statue of Guy in Guy's Hospital; and the bronze statue of Edward VI. in St. Thomas's Hospital. He executed also some busts, and many other sculptures for the gardens of Stowe. (Smith, *Nollekens and his Times*, &c.; Immerzeel, *De Levens en Werken der Hollandsche en Vlaamsche Kunstchilders*, &c.)

\* SCHEFFER, ARY, one of the most distinguished French historical painters, was born in Holland, but of French parents, in 1795. He studied art in Paris under the celebrated Baron Guerin, [GUERIN, PIERRE NARCISSE] and practised in that city with constantly increasing success, both historical and genre painting. Among his best known pictures in these lines are his 'Christ the Comforter,' a work of great power and beauty; 'The Dead Christ;' 'The Three Maries;' 'Francesca da Rimini and her Lover meeting Dante and Virgil in Hell,' one of his finest productions; Byron's 'Glaour;' Göthe's 'Faust,' 'Mignon,' &c. How skilful a portrait painter M. Scheffer is when he practises that branch of art most of our readers will have seen by his very striking portrait of Charles Dickens, which appeared in the Exhibition of the Royal Academy in 1856. The style of Ary Scheffer has little in common with that of his master Guerin. He seems to have drawn his inspiration rather from the great revivers of art in Germany, with whom, both in turn of thought and manner, he has much in common. There are, to a great extent, in both the same loftiness and simplicity, and the same somewhat pietistic devotionism in their religious works; but Scheffer has engrafted thereupon a good deal of Gallicism of style and colour, and the result is not always satisfactory, at least beyond the atmosphere of Paris. But Ary Scheffer is unquestionably a great painter, and some of his best works leave little to be desired. To him moreover the French school owes much, as one of the ablest and foremost of those who assisted in breaking the fetters of the rigid classical conventionalism in which that school had so long been bound, while he set himself as resolutely to oppose the extreme licence in which subsequently so many clever artists sought to indulge. M. Ary Scheffer's strictly technical merits are very high, though he is in his less important works at times somewhat careless. His drawing is true and graceful, his touch firm and well adapted to his style, and his colour, though wanting in mellowness and truth to nature, is often very beautiful. M. Scheffer is looked up to as a leader in devotional art by his countrymen, and his works are justly held in high estimation. From the different governments he has received the honours which on the Continent usually reward marked success in art, science, or literature. His pictures adorn the walls of the national palaces, and he bears the dignity of an officer of the Legion of Honour.

ARNOLD SCHEFFER, brother of Ary, born in Holland in 1796, obtained in early life some celebrity in the literary world by his 'Tableaux Politiques de l'Allemagne,' 1815; his 'Essai sur quatre Questions Politiques,' 1816; 'Le Nation Anglaise et le Gouvernement Britannique;' a 'History of Germany,' and other political and historical works, and he became connected with the periodical press. After the revolution of 1830, M. Arnold Scheffer associated himself with M. Armand Carrel, of the 'National,' and thenceforward distinguished himself by the acrimony of his attacks on the person and government of Louis Philippe, the warm patron of his brother Ary. M. Arnold Scheffer lived not only to see the monarchy of the barricades overthrown, but also that republican supremacy for which he had so diligently laboured. He died in December, 1853.

\* HENRI SCHEFFER, the youngest brother of Ary, was born in Holland in 1799. Like his elder brother he early dedicated himself to art; studied like him in the atelier of Guerin; and like him, though with inferior success, has practised religious, historical, genre, and portrait painting; his pictures ranging through such subjects as the 'Mater Dolorosa,' 'Joan of Arc on the way to Execution,' 'Reading the Bible,' and 'Charlotte Corday removed from the

corpse of Marat.' M. Henri Scheffer obtained the second-class medal of the Académie in 1824; the first-class medal in 1831; at the Exposition Universelle of 1851 he was awarded a first-class medal; and in 1837 he was nominated a chevalier of the Legion of Honour.

SCHEFFER, JOHN, was born in 1621 at Strasbourg, and is said to have been a descendant of Peter Schöffer, one of the inventors of the art of printing. The principal objects of his study were the ancient languages and history, in both of which he made such extraordinary progress, that in the year 1643 he published a very learned work, 'De Varietate Navium apud Veteres,' in 4to. The frequent disturbances in Alsace induced him to seek a more quiet home in a foreign country, and he went to Sweden, where, in 1648 he obtained a professorship in the university of Upsala. He died in 1679.

The life of Scheffer must have been one of incessant labour; for besides a great number of ancient authors which he edited with notes and emendations, such as Aelian's 'Variæ Historiæ,' Phædrus, Arrian's 'Tactica,' a newly discovered fragment of Petronius, Aphthonius, Hyginus, Justin, Jul. Obsequens, and others, he wrote a great number of original works on various subjects, some of which have not yet been superseded by other works. The following list contains the most important among them:—'Agrippa Liberator, sive Diatriba de Novis Tabulis,' 8vo, Strasb., 1645, a curious work on the supposed custom of cancelling debts at Rome, in order to prevent insurrections of the poor; 'De Stylo ad Consuetudinem Veterum Liber Singularis,' 8vo, Upsala, 1653; 'De Militia Navali Veterum Libri Quatuor,' 4to, 1654. This book also contains his earliest dissertation, 'Of the Ships of the Ancients,' in a somewhat altered form. 'De Antiquorum Torquibus Syntagma,' 8vo, Stockholm, 1659; a new edition with notes was published at Hamburg in 1707, 8vo; 'De Natura et Constitutione Philosophiæ Italice seu Pythagoriæ Liber Singularis,' Upsala, 1664 (reprinted at Wittemberg in 1701); 'Regnum Romanum, sive Dissertationes Politicæ Septem in librum primum T. Livii, qui est de Regibus Romanorum,' 4to, Upsala, 1665; 'Upsalia Antiqua, cuius occasione plurima in antiquitatibus borealibus et gentium vicinarum explicantur,' 8vo, Upsala, 1666; 'Graphice, seu de Arte Pingendi Liber Singularis,' 8vo, Nürnberg, 1669; 'De Re Vehiculari Veterum Libri Duo, accedit Pyrrhi Ligorii Fragmentum ex ejus libro de familiis Romanis, nunc primum editum Italice cum Lat. Versione et notis,' 4to, Frankf., 1671; this is still the best work on the subject. 'Memorabilia Sueticiæ Gentis,' Hamb., 1670; 'De Fabrica Triremium Epistola,' this little work was published at Eleutheropolis (Amsterdam) under the name of Constant Opelius, and is a criticism on a work of Meibom on the same subject. 'Lapponia, seu Gentis Regionis Lapponicæ Descriptio accurata,' 4to, Frankf., 1673; 'Lectiones Academicæ, seu Notæ in Scriptores aliquot Latinos et Græcos,' Hamb., 1675 (it was reprinted in 1698 at Amsterdam, under the title 'Schefferi Miscellanea'); 'De Situ et Vocabulo Upsaliæ, Epistola defensoria adversus Olauum Verelium,' 8vo, Stockholm, 1677; 'De antiquis verisque Regni Sueciæ Insignibus,' 4to, Stockholm, 1678; 'Suecia Literata, seu de Scriptis et Scriptoribus Gentis Sueciæ,' Stockholm, 1680. A new edition of this work, with important additions by J. Møller, was published in 1698 at Hamburg. In 1781 the Society for Education at Upsala proposed a prize for the best eulogium on John Scheffer, and the prize was awarded to that of Eric Michael Fant, which was published at Stockholm in 8vo, 1783. Several of the works of Scheffer are incorporated in the 'Thesauri of Roman Antiquities.'

SCHEFFER, HENRY THEOPHILUS, the grandson of the former, was born at Stockholm in 1710. He studied mathematics, natural history, and chemistry at Upsala, under very eminent professors of this university. He afterwards established, at his own expense, a laboratory in Upsala, and made a number of very useful experiments. It was chiefly the analysis of such metals and plants as are used for dyeing, on which he bestowed his particular attention. He was a member of the Academy of Sciences at Stockholm, and furnished many valuable papers which are printed in the Transactions of the Academy. He also delivered a course of lectures on chemistry at Stockholm, which were published in 1776, by Bergman. Scheffer died in 1759.

SCHEID, EVERARD, more generally known under his Latin name SCHEIDIUS, a philologist who distinguished himself by his deep acquaintance with the Oriental languages, was born at Arnheim in Holland, in 1742. From his early youth he devoted all his time to the acquisition of the Eastern languages, principally the Hebrew and Arabic, of which he soon became a consummate master. In 1768 he was appointed professor at the university of Harderwyck. On his removal to Leyden he succeeded J. Albert Schultens in the chair of Oriental languages; though he did not long enjoy this post, for he died in 1795, soon after his appointment. Besides his edition of the 'Minerva, seu de Causis Linguae Latine,' by Sanchez [SANCHEZ, FRANCISCO] Scheid left several works on Eastern literature which are highly valued by scholars. The following are the titles of some: 'Præmiæ Lineæ Institutionum, sive Specimen Grammaticæ Arabicæ,' 4to, Leyden, 1779; 'Ebn Doreydi Kassida, sive Idyllium Arabicum, cum Scholiis,' 4to, ibid., 1786; 'Oratio de Fontibus Literaturæ Arabicæ,' 4to, ibid., 1767. He published also 'Glossarium Arabico-Latinum Manuale,' 4to, Leyden, 1769; being an abridgment of the large Arabic and Latin lexicon by the celebrated James Goliuz. Scheid had projected

a new Dutch translation of the Bible and other works, which death prevented him from executing.

SCHNEIER, CHRISTOPHER, a learned German astronomer, was born at Wald near Mundelheim in Suabia, in 1575, and became a member of the order of Jesuits in 1595. Having early made proficiency in mathematics and astronomy, he was appointed professor of those sciences at Ingolstadt, and he afterwards gave instruction in them at Fribourg and Rome. The principal circumstance by which the life of this philosopher is distinguished is a discovery, in 1611, of the spots on the sun, independent of that which had been made by Galileo a few months previously. This discovery is announced in three letters addressed by Scheiner to Velsler, the senator of Augsburg, in which the writer states that, in the beginning of the year, while looking at the sun through a telescope, he perceived on its disc some dark spots; and that in the following month of October, on repeating the observations, he ascertained that the spots had a movement across the disc. It appears from the same letters that P. Scheiner at first thought the spots to be small planets revolving about the sun; an idea which was afterwards maintained by P. Malapertius in a work published in 1627.

An expression in a letter from Velsler to Galileo puts it out of doubt that the discovery made by the Italian philosopher was known in Germany when the letters of Scheiner were published (1612); and it must be further admitted that to Galileo belongs the merit of having, from the first, considered the spots of the sun as adhering to the disk of the luminary, and of having drawn from the regularity of their motions an argument for the rotation of the sun about its axis. It is but just however to Scheiner to state that he almost immediately abandoned his first hypothesis, and that we are indebted to him for numerous observations on the spots, as well as of Jupiter's satellites. The observations were published at Rome in 1630, in a work which, from being dedicated to Prince Orsini, was entitled 'Rosa Ursina.'

Scheiner, unfortunately for his fame as a philosopher, united himself with those persons who, at that time, opposed the hypothesis of Copernicus, and he published in 1614 at Ingolstadt, a volume entitled 'Disquisitiones Mathematicæ,' in which he argues in favour of the opinion that the earth is at rest in the centre of the universe. Besides these works Scheiner published, in 1616, a treatise on gnomonics; and, in 1617, a tract on celestial refraction, in which he assigns the true cause of the elliptical form assumed by the disc of the sun when near the horizon. He also published a treatise on optics in 1619. Scheiner was the inventor of the pantograph, and he has given a description of the instrument in a tract entitled 'Pantographice,' &c., Rome, 1631. This distinguished Jesuit, after quitting Rome, became rector of Neiss in Silesia: he gave lessons in mathematics to the archduke Maximilian, and at length he became confessor to the archduke Charles. He died of apoplexy in July 1650, leaving the character of having been a man of agreeable manners as well as a laborious student.

SCHÉLLER, J. J. G. was born in 1735 at Jhlow, a village in the electorate of Saxony. He was educated at the Thomas schule of Leipzig, and afterwards in the university of the same place. He studied under Ernesti, and devoted himself to theology and philology. In 1761 he was appointed head-master of the public school at Lübben, and in 1772 to the rectorship of the gymnasium of Brieg, in which office he continued until his death in 1803.

Scheller is principally known as the author of a Latin dictionary (Latin and German, and German and Latin), the first edition of which was published at Leipzig, in 1783, and the second in 3 vols. 8vo, 1788. The third edition, which was very much improved and enlarged, appeared in 7 vols. 8vo, in 1804-5. This book was very much used at the time, as it was almost the only dictionary of practical utility that had been published in the German language. It has been translated into Dutch (2 vols. 4to, Leyden, 1799, with a preface by Ruhnken), and, some years ago, into English also. Scheller also wrote a smaller Latin dictionary for the use of schools; the second (1812) and subsequent editions were revised and improved by Lünemann. Scheller's other works are, 'Præcepta Styli bene Latini' (a third edition of which appeared in 2 vols. 8vo, Leipzig, 1797), and a Latin Grammar ('Ausführliche Lateinische Sprachlehre') which went through three editions, Leipzig, 1779, 1790, and 1803. This grammar is a work of little value; it has been translated into English.

SCHELLING, FRIEDRICH WILHELM JOSEPH, one of that famous series of modern German philosophers, of which Kant, Jacobi, Herbart, Fichte, and Hegel are the other chiefs, was born at Leonberg in Württemberg, in 1775. He studied first at Tübingen, where he had Hegel for his college-fellow, and where the two future rivals in philosophy formed an intimate friendship. Schelling, though somewhat the younger man, was somewhat the older philosopher, and Hegel was first indoctrinated by him in philosophy. From Tübingen, Schelling went to Leipzig and Jena—his attraction to Jena being Fichte's philosophical lectures. He started in his philosophical career as an ardent admirer and disciple of Fichte; and it was not till 1798—when, on Fichte's removal from Jena, Schelling succeeded him in the Philosophy chair of that university—that Schelling became aware of his own differences from Fichte's system. He had already been a contributor to Fichte's Jena journal; but now, in preparing his own course of lectures, he necessarily enlarged his speculations. In 1799 he published 'Erster Entwurf eines Systems der Naturphilosophie,

zum Behuf seiner Vorlesungen; but it was orally by means of the lectures themselves that he first effectively disseminated his new philosophical ideas. Hegel, who had in the meantime been living at Frankfurt-on-the-Main and elsewhere, now joined his friend at Jena (1800), and Schelling's doctrine was advocated in common by himself and Hegel—the two acting as joint editors of a journal, and Hegel appearing independently, in Schelling's interest, as the author of an essay on the 'Difference of the Systems of Schelling and Fichte.' In 1803 Schelling left Jena for Würzburg, Hegel succeeding him at Jena, as he had succeeded Fichte; and in 1807 he removed from Würzburg to Munich, where he remained till 1841.

By the year 1814, when Fichte died at Berlin, the philosophy of Schelling, who had then been seven years settled at Munich, may be considered as having gained the ascendant throughout Germany, as a development beyond that of Fichte and superseding Fichte's system. This had been owing partly to the diffusion of Schelling's views by himself personally in the lecture-room at Jena, at Würzburg, and at Munich; but partly also to various scattered writings—some in the form of contributions to journals, some as reports of the substance of his lectures, some as public addresses, and some as distinct essays for the press—published by him up to the date in question. Among the more important of these publications were the following:—'On the System of Transcendental Idealism,' 1800; a discourse entitled 'Bruno: oder, über das göttliche und natürliche Princip der Dinge,' 1802; an essay entitled 'Ideen zu einer Philosophie der Natur, als Einleitung in das Studium dieser Wissenschaft,' 1803; 'Darlegung des wahren Verhältnisses der Natur-Philosophie zu der verbesserten Fichteschen Lehre,' 1806; a discourse, 'Über das Verhältniss der bildenden Künste zu der Natur,' delivered before the Royal Academy of Sciences in 1807; a work entitled 'Von der Weltseele, eine Hypothese der höheren Physik zur Erklärung allgemeinen Organismus; nebst einer Abhandlung über das Verhältniss des Realen und Idealen in der Natur,' 1809; the first volume of a collection of his 'Philosophische Schriften,' published in the same year; and a series of fourteen lectures, 'Über die Methode des Academischen Studium,' published in 1813.

Living at Munich on the reputation of these writings, Schelling continued from time to time to develop portions of his doctrines in public addresses or in detached essays; but on the whole there was in these no important alteration of his philosophy as already given forth in the first fifteen years or so of the present century. Meanwhile, as he had burst away from Fichte, so his old friend and associate Hegel had burst away from him. The germs of a difference between Hegel's philosophical teaching and that of Schelling had manifested themselves in Hegel's lectures at Jena as early as 1806, if not earlier; they had been developed in subsequent works of Hegel; and at length, in 1817—when Hegel was appointed to the Philosophy chair at Berlin, which had been vacant since Fichte's death—Hegelianism began to appear in the German atmosphere as a system calculated to dispossess Schellingism, as that had dispossessed the system of Fichte. The struggle between Hegelianism and Schellingism increased—the former system evidently victorious on the whole—till 1831, when Hegel died at Berlin, and Schelling remained alone, in a Germany already filled with the adherents of his opponent, and regarding him as superannuated and left behind in the philosophic march. Schelling was aware of his position; but he was of opinion that, without altering the essence of his own system as it had preceded Hegel's, but by only bringing out aspects of it not formerly made apparent, and developing some modifications the necessity of which he had overlooked, he should be able to present Schellingism in a form which would enable it to stand its ground or recover its ground even in Hegel's Germany, and which would at the same time bring it into harmony with other modern movements of German thought with which he sympathised, and especially with the religious movement which aimed at a restoration of deep Christian faith as opposed to hard Rationalism. Accordingly, the later portion of Schelling's life—first at Munich, and afterwards at Berlin, to which he was transferred in 1841—was spent in the rumination, and partly in the public announcement of this second or matured edition of his philosophy. In Berlin—where he retained his chair but for a few years, but where he afterwards lived habitually—the old man was revered as a philosophic patriarch, and his society, like that of Humboldt, was sought after by savans and thinkers. Bunsen, and others of the modern German school of theology, appear to have held him in high esteem. To them the nature of his second or final philosophy may have been made clear by his own conversations; but he had not published any connected exposition of it, nor was it known throughout Germany otherwise than vaguely when he died, in August 1854, at the age of seventy-nine. His death took place at Ragaz in Switzerland, whither he had gone for the benefit of his health.

For the right appreciation of Schelling's philosophy, it is necessary to remember it in its historical relations as a portion of that continuous development of philosophic thought in Germany which Kant began. Kant may be said to have bequeathed two contrary tendencies to the philosophy of his countrymen—the tendency to Objective Realism, which supposes a firm external reality in the universe, underlying all phenomena, and constituting the Not-Me; and the tendency to Subjective Idealism, which regards the thinking mind as the sole

reality, and sees all the so-called objects and phenomena of the universe only as modifications or projections of the Me, or as so much various *thought* of the thinking being. "All subsequent German philosophy has been the prosecution of one or other of these speculative directions, or the attempt to reconcile them." Earliest on the realistic side were Jacobi and Herbart; the latter of whom especially fought against the too great Subjectivism that there was, or that there might be found, in Kant's system as a whole. Fichte, on the other hand, appeared as the thorough-going champion and exponent of the Kantian Idealism. Not content with the notion of the thinking mind and the external universe, the Ego and the Non-Ego, as being two co-ordinate realities to be both accepted on the evidence of consciousness, Fichte allowed independent reality only to the Me, and regarded the universe only as variations of this Me in thought or consciousness. Out of this doctrine he developed his powerful philosophy. Towards the end of his career however he was becoming unsteady in his Idealism, from fear that Nihilism might be its logical consequence, and he was straining after a doctrine of so-called 'absolute identity,' which should refer all to one absolute eternal substance, involving both the Me and the Not-Me. What Fichte was striving after Schelling accomplished. His system is properly post-Fichtean in historical order, and its main characteristic consists in a kind of universal Objectivism arrived at by first passing through Fichte's universal Idealism. In fact, Schelling was not at first aware that he was doing more than pushing Fichte's doctrine out in a direction in which Fichte meant it to be pushed.

Fastening, as it were, on the universal Me or 'World-Me,' which Fichte had set forth as the one reality on which philosophy should gaze, Schelling conceived the idea that this absolute eternal subject might be regarded and proceeded from as also the absolute eternal object, out of which all things, both in the mode of the Me and in that of the Not-Me, might be considered as evolving themselves. This doctrine of absolute identity, of a universal and infinite subject-object out of which all things have proceeded by a law of self-movement, is the cardinal doctrine of Schelling. According to Schelling, a knowledge of the absolute is the only true philosophy, and such knowledge is possible. But it is possible only by a capacity above consciousness and understanding—by what he calls 'Intellectual Intuition'; which is a kind of falling back or swooning of human reason into the absolute as being identical with itself. If man can know the absolute, it can only be because man himself is identical with that absolute; because knowledge is the same thing as existence, because thinking and being are one. But this is but one aspect of the doctrine of the identity of thought and being, of the subjective and the objective. That absolute, which we come to cognise only through identification with it, and which we name Deity, is to be regarded in its original condition as neither object nor subject, neither nature nor mind, but as the union, the indifference, the slumbering possibility of both. It has become all that exists by a process of self-movement, continually potentiating itself higher and higher, from the lowest manifestations of what is called matter, up to organic existence and the activity of reason itself in the guise of humanity. In this movement of Deity or the Absolute One, which constitutes the Life of the Universe, there are two modes—first, the expansive movement, or objectivising tendency, by which the absolute rushes forth, so to speak, into actual existence, and out of the *natura naturans* there comes the whole variety and complexity of the *natura naturata*; and, secondly, the contractive movement, or subjectivising tendency, by which the *natura naturata* falls back on the *natura naturans*, and becomes conscious of itself. The study of the absolute as engaged in the first movement—that is, as coining itself off into the objective—is natural philosophy; and only when the philosophy of nature is so considered—that is, when nature is considered as so many successive potentiations of the absolute in the form of thought—can it be rightly studied. "A perfect intellectualising of the laws of nature into laws of intuition and of thinking would be the highest perfecting of the science of nature." Of this style of treating the laws of nature, as modes by which the absolute proceeded in the process of thinking itself gradually out into all that as yet exists, Schelling himself set the example. He interpreted what is called inorganic nature, with its laws of gravity, light, magnetism, and electricity, as being the absolute in what he called its "first potency," or working on in its first efforts for converting the possible into the actual. Even here the subjective and the objective were already differentiated, but objectivity predominated. Then came the second potency, or potency of chemism, representing a higher stage in the life, or intellectual activity of the absolute. To this succeeds the third potency, of organically-living nature, where we first see the aspect of consciousness or predominating subjectivity. Though Deity is immanent in all nature, it is in man that Deity becomes most conscious; and the highest reason of man is identification with Deity—a relapsing into the infinite. The ideal in man also corresponds to the real in nature; and in the perception of this is the true philosophy of art.

Such was the doctrine of 'absolute identity,' as it was propounded in Schelling's first or earlier philosophy. For a fuller view of the immense extension which he gave to it as affecting every possible department of thought, we must refer to his own writings; or to a very accurate and profound summary of Schelling's system given by

Chalybæus in his 'Historical Development of Speculative Philosophy from Kant to Hegel' (of which there are two English translations); or (for more popular purposes), to Mr. Morell's account of 'Speculative Philosophy in the Nineteenth Century.' Information on the same subject is to be obtained from Cousin; and there is a French work entitled 'Schelling; Ecrits Philosophiques, et morceaux propres à donner une idée générale de son Système: traduits de l'Allemand par Ch. Bénard,' 1847. This work includes Schelling's lectures on the methods of academic study; his discourse on the philosophy of art is accessible in English. (Chapman's 'Catholic Series,' 1844.)

Apart altogether from the scientific comprehensiveness and precision at which Schelling aimed, there was much in the spirit and phraseology of his system—in such phrases for example, as the 'rhythm of the Universe,' the 'Infinite becoming finite,' the 'Immanence of Deity in Nature'—to captivate poetical and enthusiastic minds. In fact, the system was a species of sublime Pantheism, which accorded well with the tone of German thought as affected or determined by Göthe, Tieck, and other poets. But, as we have said, the system did not remain satisfactory even in Germany. On the one side Hegel had tried to tear it to pieces on the score of its substitution of enthusiasm and poetry for logic, and had promulgated a system which found more acceptance with harder minds; on the other, the re-awakened Christian zeal of German theology, complained that it was but a vague pantheism, leaving no room for that 'personal God' which the human soul demanded as essential to true religion, and, moreover, in its identification of man with deity, contradicting those notions of sin, redemption, and the like, which form the basis of Christianity. To prop up his system against these attacks, or, at least, to reissue his system in a form which would save it from attacks from the latter quarter, was Schelling's object during the last portion of his life. A summary of his 'later views' so far as they are ascertainable, will be found in Chalybæus. Suffice it here to say that, by a peculiar modification of his theory of the absolute,—according to which modification he now maintained that, though nature and Deity were identical, yet nature might not be and was not coextensive with all Deity, that is, that the absolute might be considered as being in all objects and yet as not being exhausted in all objects taken collectively, but as being moreover a certain force or fund of unobjectivised will and reason,—Schelling imagined that he set himself right with theology at all points, and emerged out of Pantheism into pure Theism, and out of Rationalism into warm Christian faith. Working his new notion in such phrases as that "the part of the absolute immanent in the finite cannot be the whole nor the most peculiar part of Deity" and that "what is immanent in nature is that in God which is least God himself," he arrived at the doctrine of a 'personal God,' and also at the notions of 'human imperfection,' and 'moral evil,' and so he reconciled his philosophy with the Christian scheme of the world's history as a fall from good and a divine recovery.

SCHEPLER, LOUISA. [OBERLIN, J. F.]

SCHEUFFELIN or SCHAEUFFELEIN, HANS LEONARD, commonly called Hans Scheuffelin, a very celebrated old German painter and wood-engraver, was born at Nürnberg about 1490. His father Franz Scheuffelin was a merchant of Nördlingen who settled in Nürnberg. Young Hans was placed with Albert Dürer, with whom he was a great favourite. He remained in Nürnberg until 1515, when he removed to Nördlingen, where he died in 1539 or 1540; probably the former year, as his widow was married again in 1540 to the painter Hans Schwarz. There are several of Scheuffelin's paintings in Nördlingen, of which the principal is the Taking down from the Cross in the church of St. George; it is a picture with two revolving wings, and was painted in 1521. There are several good paintings by Scheuffelin also in Nürnberg, Tübingen, Stuttgart, Oberdorf, and other neighbouring places; and there are some in the galleries of Munich and Berlin.

There are also many woodcuts by Scheuffelin, and both woodcuts and pictures are sometimes attributed to Albert Dürer, to whom however Scheuffelin was inferior in all respects.

\* SCHEUTZ, GEORGE, the father, and SCHEUTZ, EDWARD, the son, the producers of the second independent invention of a machine for calculating mathematical tables by the method of differences, and printing the computed results; the history of which, whether it be viewed under a moral, an intellectual, or an economical point of view, is almost equally remarkable, and has bearings also on the history of science of a very interesting and instructive kind.

MR. GEORGE SCHEUTZ, a printer at Stockholm, who has published many useful works in the Swedish language relating to industrial progress, was in the year 1834 the editor of a technological journal, also published in that city; but the reputation which he acquired in his own country from these works has been superseded by the far wider celebrity founded on the invention just alluded to. Mr. Babbage [BABBAGE, CHARLES] was the first person who conceived the idea of performing mechanically all the systems of additions of differences which are required in the calculation of mathematical tables. A full account of the principles and action of the 'Difference Engine' which he constructed to realise this idea, but without any details of its mechanism, appeared in the 'Edinburgh Review' for July 1834 from the pen of Dr. Lardner, who had also given lectures on the subject at the Royal Institution, the London Institution, and probably at others.

From the perusal of that article Mr. George Scheutz derived the first conception of constructing a machine for effecting the same purpose as that of Mr. Babbage, and on the same fundamental principle—the method of differences. Unfortunately in one respect for himself, Mr. Scheutz was fascinated by the subject, and impelled by an irresistible desire to construct such an engine. After he had satisfied himself of the practicability of the scheme by constructing various provisional models, he postponed to a future period its further prosecution. Three years afterwards, in the summer of 1837, his son, MR. EDWARD SCHEUTZ, at that time a student in the Royal Technological Institute or School at Stockholm, where he afterwards completed his studies with great credit, anxious to assist his father in this difficult task, abandoned for that purpose the career he had previously chosen, and proposed to construct a working model in metal. In this he succeeded, so far as to demonstrate the feasibility of the design and the applicability of the engine to the practical purposes for which it was intended. Mr. George Scheutz, who had expended a large portion of his fortune on the effort, now determined to apply to the Swedish government for its sanction and assistance; but after a silence of nearly four months a negative answer was returned. He recommenced his experiments however with renewed energy, expending on them all the remaining savings of an industrious life, as well as the whole of the time he could snatch from the labours on which the support of his family depended. The father and son continued to work together for several years, and "after many trials and many alterations the calculating apparatus was in the year 1840 so far completed, that it correctly calculated series with terms of five figures and one difference, also of five figures. On the 29th of April 1842 the model was extended so as to calculate similar series with two and three orders of differences." In the following year it was submitted to the inspection of the Royal Swedish Academy of Sciences, and on the 18th of September a certificate of its efficiency was obtained, signed by the late Baron Berzelius [BERZELIUS, or BERZEL, JÖNS JACOB], secretary; by Selander, the astronomer; and by G. B. Lilliehöök, R.N., professor of Natural Philosophy in the Royal Military Academy at Marieberg.

The inventors now sought for orders in various countries, making use of the certificate as a recommendation; but, meeting with no success, "the model remained shut up in its case during the ensuing seven years [!]. . . . The severe economy they had been compelled to use in the purchase of materials and tools, and probably the absence in Sweden of those precious but expensive machine-tools which constitute the power of modern workshops, rendered this new model unsatisfactory in its operations, although perfectly correct in principle. . . . Exhausted by the sacrifices thus made, yet convinced that with better workmanship a more perfect instrument was within their reach," and a committee of the Academy of Sciences having made another inspection of the model, Mr. George Scheutz, at the beginning of 1851, again applied to the government to obtain the means of carrying the plan into full execution, "by the construction of a larger and still more improved machine." The application was first referred to the Academy, whose advice was favourable; but the decision was, that there were no public funds at the disposal of the government for the object in question. In the diet of the same year however Mr. A. M. Brinck, a merchant, member for Stockholm, moved that a national recompense should be given to the inventors, which was at length acceded to, "on condition that the money was to be refunded if the machine was not completed before the end of the [apparently the financial] year 1853; or if, when completed, it was not found to answer its purpose." The amount thus accorded was the moderate sum of 5000 rix-dollars, or about 280*l.* sterling. The conditions of the grant obliged the inventors to procure, in the first instance, a guarantee for its repayment in case of failure. Fifteen gentlemen, some of them members of the Academy, agreed to divide this responsibility among themselves; and a portion of the necessary means having been thus secured, and the inventors having pledged their own credit for the remainder, the new machine was constructed, in conformity with the drawings of Mr. E. Scheutz, and under his superintendence, at the manufactory of Mr. C. W. Bergström, at Stockholm. It excelled its predecessor by its range, including not only the denary scale, but also that mixture of the denary and senary scales which is requisite in tabulating degrees (or hours), minutes, and seconds, and by an amendment in the printing apparatus. These improvements had been suggested by General Baron Fabian Wrede, chief of the Royal Military Academy of Marieberg, a member of the Academy of Sciences, and one of the most zealous promoters of the undertaking.

The Academy of Sciences now represented that the expenditure incurred by Messrs. Scheutz had far exceeded the sum awarded as the national recompense, upon which the Diet awarded a second sum of the same amount, 280*l.* During the last months of 1854 the inventors visited England and France, bringing with them from Stockholm the result of their persevering labours. Through Mr. William Gravatt, C.E., F.R.S., it was made known to some of the officers and leading fellows of the Royal Society of London, and was removed to the apartments of the Society at Somerset-House, where it was worked and its mechanism explained to the fellows of the society and other visitors. A committee consisting of Professor Stokes, Sec. R.S., Professor W. H. Miller [MILLER, WILLIAM HALLOWS], Professor Wheatstone, and Professor the Rev. R. Willis, was appointed by the council

of the society to examine the machine. They produced a most interesting and satisfactory report, from the pen of Professor Stokes, describing at some length the powers of the machine, and concluding in these terms: "It is mainly, as it seems to us, in the computation of mathematical tables [as distinguished from the tabulation of functions for other purposes] that the machine of M. Scheutz would come into use. The most important of such tables have long since been calculated; but various others could be suggested which it might be worth while to construct, could it be done with such ease and cheapness as would be afforded by the use of the machine. It has been suggested to us, and we think with good reason, that the machine would be very useful even for the mere reprinting of old tables, because it could calculate and print more quickly than a good compositor could set the types, and that without risk of error." This report was read before the Royal Society on the 21st of June 1855, and will be found in the 'Proceedings,' vol. vii., p. 499-509.

At the twenty-fifth meeting of the British Association for the Advancement of Science, held at Glasgow in September 1855, Mr. Henry Prevost Babbage, one of the sons of the first inventor of the Difference Engine, and an officer of the Indian army, made an oral communication to the Section of Mechanical Science, 'On Mechanical Notation, as exemplified in the Swedish Calculating Machine of Messrs. Scheutz,' referring to graphic tables exhibiting, in that notation, its construction and mode of working. An abstract of it is given in the report of the meeting, 'Transactions of the Sections,' p. 203-5. The system of describing machinery, termed 'Mechanical Notation,' had been devised by Mr. Babbage, senior, and made public in the 'Philosophical Transactions' for 1826. By its means a complete description was given of the Swedish engine on two pieces of paper, on which was rendered visible to the eye, in one unbroken chain, the whole sequence of its minutest movements. The machine having been removed to the Paris Universal Exhibition of 1855, the appropriate jury, led by M. Mathieu, member of the Academy of Sciences of Paris and of the French Board of Longitude, an astronomer and mathematician well acquainted with all the calculating machines before produced or proposed, unanimously awarded it the gold medal. To assist in making known the construction and the theory of the machine, Mr. Babbage had presented a note relative to it to the Academy of Sciences of Paris, referring to his son's graphic tables already noticed, which were exhibited to the members on the 8th of October. This note appears in the 'Comptes Rendus' under that date, vol. xli., p. 557. The gold medal was publicly presented to Messrs. Scheutz by his royal highness Prince Charles of Sweden in the royal palace of Stockholm, on the 21st of April 1856. Mr. George Scheutz had been elected, some time previously, a member of the Royal Swedish Academy of the Third Class, for the Science of Mechanics, and on the 28th of April he was made Chevalier of the order of Wasa. Mr. E. Scheutz afterwards exhibited the machine at work in the Imperial Observatory of Paris, and then brought it to London again, where, by the advice of Mr. Gravatt, and after consultation with Mr. Babbage, it was caused to compute and print a collection of specimens of numerical tables, which has subsequently been published in a pamphlet noticed in the sequel of this article.

Through the exertions of Professor B. A. Gould, of the Dudley Observatory, at Albany, in the United States of North America, Messrs. Scheutz's engine has since become the property of that Observatory, as a gift from a public-spirited merchant of Albany, Mr. John F. Rathbone. An account of the construction and mode of working of this engine will be given in the article CALCULATING MACHINES, in ARTS AND SC. DIV. A detailed description of the machinery, both for calculating and for furnishing stereotype plate of the results, will be found in the specification, dated October 17, 1854, of the patent which the inventors have taken out.

It is now requisite to state that two things only are common to the Difference Engines of Messrs. Scheutz and Mr. Babbage,—the principle of calculation by differences, and the contrivance by which the computed results are conveyed to the printing apparatus. The former, Mr. Babbage has himself remarked, "is so obviously the only principle, at once extensive in its grasp, and simple in its mechanical application," that he has "little doubt it will be found to have been suggested by more than one antecedent writer;" while the latter is well known in the striking part of the common eight-day clock, which is called the "rail." But, everything else in the machine of Messrs. Scheutz is perfectly original. It consists of two parts,—the calculating and the printing; the former being again divided into two,—the adding and the carrying parts. With respect to the adding, its structure is entirely different from Mr. Babbage's. The very ingenious mechanism for carrying the tens is also quite different from his. The printing part is altogether unlike that represented in the drawings of the latter; which, indeed, were entirely unknown to the Swedish inventors.

A gratifying incident in the history of science and its votaries may appropriately conclude our account of Messrs. Scheutz's achievement. At the Anniversary Meeting of the Royal Society, on the 30th of November 1855, Mr. Babbage addressed the President, Lord Wrottesley, and the fellows present, of whom the writer of this article was one, on the subject of the distribution of the medals for the year, expressing his regret that a medal had not been awarded for the Swedish Calculating Machine. As some misapprehension, he said,

existed in the public mind respecting the originality displayed in that invention, he would proceed to explain some of its principles, and thus "render justice to its author." After introducing the discrimination between the two Difference Engines, which has been adopted above, and declaring that while Mr. (George) Scheutz had always avowed, "in the most open and honourable manner, the origin of his idea," but that his finished work contained undoubted proofs of great originality, and showed that little beyond the principle could have been borrowed from his (Mr. Babbage's) previous work; he proceeded to relate, in the most sympathising terms, the progress, difficulties and final success of Messrs. Scheutz, concluding with a generous eulogy, and with the expression of a hope that the council of the ensuing year would repair what he considered to have been an omission on the part of the previous council. At a meeting of the Institution of Civil Engineers, on the 20th of May 1856, Robert Stephenson, Esq., M.P., F.R.S., President, in the chair, Mr. H. P. Babbage again exhibited and explained his diagrams; and his father took the opportunity of repeating his testimony to the originality and merits of the inventors, but with a more detailed discrimination between their Difference Engine and his own. An account of both communications has been given in the 'Minutes of Proceedings of the Institution of Civil Engineers,' vol. xv., pp. 497-514. It is not unfrequent to hear public testimony given by one man of science in favour of the merits of another in a different department, or in a different path even of his own. But here was the undoubted first inventor of the Difference Engine bearing explicit testimony to the originality of the second, who might be regarded as his rival, and that before the 'President and Council of the Royal Society of London,' by whose predecessors in office his own invention or discovery had been recommended to the support of the British government, a third part of a century before. Mr. Babbage subsequently printed his 'Observations,' from which, indeed, as already indicated, some parts of this notice have been derived. The source of others will be found in the preface to the following, a publication also before alluded to, and of which, as being the first of its kind, we give a bibliographical description. 'Specimens of Tables, Calculated, Stereomoulded, and printed by Machinery.' London (Longman & Co.), 1857. 'Printed (without the use of types) by C. Whiting, Beaufort House, Strand,' in Royal Octavo. Dedicated by Messrs. Scheutz to Mr. Babbage. Preface, giving the history of the Machine, p. i to xviii. Abstract furnished by Mr. William Gravatt, C.E., F.R.S., "of his own manner of considering and working this Machine," p. 1 to 10. [Table] 'No. 1. Logarithms of numbers from 1 to 10,000, calculated, stereomoulded, and printed by machinery,' pp. 11 to 42. 'Specimens of various Tables,' fourteen in number, of which some are purely numerical, others trigonometrical; one gives the ranges of shot with various charges of powder; another the logarithmic value of male life in London; and the last four are astronomical: p. 43 to 50. An impression of the engraving on wood representing the machine, which originally appeared in the 'Illustrated London News' (for June 30, 1855, p. 661), is prefixed as a frontispiece.

SCHIAVONETTI, ANDREA, called MEDULA, was born at Sebenico in Dalmatia, in 1522. He was of obscure parentage, and was placed with a house-painter at Venice, where he employed his leisure time in studying from prints after Parmigiano, and in contemplating the works of Giorgione and Titian. The latter artist, having become acquainted with the poverty of Schiavone, and approving of his ability, employed him with Tintoretto and others in the grand works for the library of S. Marco, where three entire ceilings are said to be by his hand. He soon became the rival of Tintoretto, but although he was excellent as a colourist, his defective knowledge of drawing rendered him unable to compete successfully with that master; the work however which he painted for the church of Santa Croce, representing the Visitation of the Virgin to Elizabeth, gained him considerable reputation. Two of his most admired works are in the church of the Padri Teatini at Rimini, one of them the Nativity of our Lord, the other the Assumption of the Virgin. Schiavone died at Venice in 1582. His chief merit consists in his colouring, to which he seems to have sacrificed other requisites of his art. Still his attitudes and draperies are graceful, and his countenances, more especially of women, expressive; nor are his compositions deficient in variety and skill. There are several etchings by him, some from his own designs, and others after Raffaele, Parmigiano, and other artists.

SCHIAVONETTI, LUIGI, or LOUIS, was born at Bassano, in the Venetian states, April 1, 1765. He was the eldest son of a stationer, with a large family and limited means. Luigi very early displayed a talent for drawing, and at the age of thirteen was placed under Giulio Golini, or Goldini, a painter of some eminence, who became much attached to his pupil. On his death about three years after, the young Schiavonetti turned his attention to engraving, and received some instruction in the mechanical part of the art from a very indifferent engraver named Lorio. He was employed for a time in engraving for Count Remaundini, and appears to have aimed at the style of Bartolozzi, whose engravings in the chalk manner were then attracting much attention. His skill in imitating this master led to a connection with an engraver named Testolini, who eventually induced him to remove from Bassano to London, where he resided for some time with Bartolozzi, and afterwards established himself. He profited much by his connection with Bartolozzi, and continued the exercise of his talents

with increasing reputation until his death, on the 7th of June 1810. Most of the works of Schiavonetti were small, though he executed some important plates, and was engaged, at the time of his death, on the large engraving of Stothard's 'Canterbury Pilgrimage,' which was finished by James Heath. Besides his more elaborate works, the free etchings of Blake's illustrations to Blair's 'Grave,' and the beautiful head of Blake prefixed to that work, are deservedly admired. Like the eminent man whose manner he adopted, he was distinguished for the freedom and accuracy of his drawing. The private character of Schiavonetti was such as to ensure general respect, and his funeral was attended by the president and several members of the Royal Academy. His brother Niccolò engraved in conjunction with him, and did not long survive him. (*Life* by Cromek, in 'Gent. Mag.' vol. lxxx. part 1, &c.)

SCHIDONI, or SCHEDONE, BARTOLOMEO, was born at Modena, in 1660. Malvasia reckons him among the disciples of the Caracci, but Fuseli seems to doubt the correctness of this assertion, observing that either his earliest performances must be unknown, or that he must have been a very short time with the Caracci, since it is difficult to find any trace of their style even in his largest works. However this may be, it is evident that he formed his style by an attentive study of the works of Correggio, whose grace and delicacy he more nearly approached than any other of the numerous imitators of that great artist; and in the cathedral of Modena there is a picture of S. Geminiano resuscitating a dead child, which has often being mistaken for a work of Correggio. Schidoni's juvenile performances in the public edifices of Modena had gained him considerable reputation, when Runuccio, duke of Parma, appointed him his principal painter. He executed for the duke several historical subjects, much in the manner of Correggio, but was chiefly employed in painting the portraits of his patron and his family; he painted also the portraits of all the princes of the house of Modena, which were distinguished by so much taste and variety of attitude, and delicacy of colouring, as caused him to be reckoned among the best masters in Italy. Schidoni's style is extremely elegant; his touch light and delicate; the airs of his heads graceful; his skill in the treatment of the chiaroscuro and his colouring are admirable, and all his works are exquisitely finished, but he is often incorrect in his drawing. His works are always eagerly sought after, and their value is accordingly greatly enhanced by their extreme rarity. He died in 1615.

SCHILLER, FRIEDRICH, the greatest dramatist and one of the most popular poets of Germany, was born on the 10th of November 1759, in the town of Marbach, on the banks of the Neckar. He was first sent to school at Ludwigsburg, where, under the celebrated Jahn, he read Ovid, Virgil, and Horace, and also commenced Greek. But he had to follow the changes of residence and life of his parents, which interrupted his studies. This irregularity Carlyle thinks not the most propitious for educating such a boy, but we conceive that its variety was most propitious to the poet, who requires more knowledge of life under its manifold phases, than of books. Schiller had to gather the elements of learning from various masters. "Perhaps," says Carlyle, "it was owing in part to this circumstance that his progress, though respectable, or more, was so little commensurate with what he afterwards became." But, like most men of genius, we suspect he found the current of life too strong within him,—his heart throbbing with too many active impulses, to attend much to his drier studies, and that "the stolen charms of ball and leap-frog were frequently bought by reproaches." There is a poetic anecdote of his being found, while quite a child, during a thunder-storm, "perched on the branch of a tree, gazing at the tempestuous face of the sky and watching the flashes as in succession they spread their lurid gleam over it; and when reprimanded by his parent, he replied, that the lightning was so very beautiful, he wished to see where it was coming from." This does not seem like one whose organisation fitted him to become the Brodtelehrte (mere scholar) whom he afterwards so humorously described. (See his 'Essay on Universal History'.)

In 1772 he had to prepare for confirmation, and his mother "having called him out of the street" (where he was playing), to seriously collect his thoughts, he wrote a hymn, which was his first composition, and which led to the opinion of his being adapted for the ecclesiastical order. He welcomed the prospect, and underwent the four annual examinations before the Stuttgardt Commission, to which young men designed for the church are subject. But fate decided otherwise. The Duke of Würtemberg, having founded a college, gave the sons of his officers a preferable claim to its benefits; he offered them to Schiller's father, who was an army surgeon, and, afraid to refuse the offer, young Schiller accepted it, but with great reluctance, and was, in 1773, enrolled as a student of law. Schiller, unable to endure the thralldom, exchanged it, in 1775, for the study of medicine, which however he only accepted as less tedious. Apart from his profession he stole cherished hours, which were devoted to Plutarch, Shakspeare, Klopstock, Lessing, Göthe, Garve, Herder, Gerstenberg, and others. The 'Messias' of Klopstock and the 'Ugolino' of Gerstenberg were among his earliest and deepest studies, and, combined with his own religious tendencies, had early turned him to sacred poetry. At the age of fourteen he had finished the plan of an epic on Moses, which he subsequently worked up into a dissertation on the 'Legation of Moses.' (See his 'Sendung Moses'.) But the popularity of 'Ugo-

lino' and Göthe's 'Götz von Berlichingen,' and the impression which they made on him, inspired him with a dramatic impulse, and he wrote the 'Student of Nassau' and 'Cosmo dei Medici,' some fragments of the latter he preserved and incorporated with the 'Robbers'.

Schiller brooded gloomily over his situation. He would often escape in secret to catch a glimpse of the busy world which to him was forbidden; but this only rendered him more averse to school-formalities and class-books, so that he would frequently feign sickness, that he might be left in his own chamber to write poetry. In addition to magazine contributions of little value, Schiller worked at his 'Robbers,' and when, in 1780, he graduated, he quoted from it in his thesis ('Ueber den Zusammenhang der Thierischen Natur des Menschen mit seiner Geistigen') as from an English work, 'The Life of Moor, Tragedy by Krake, act v., s. 1.' After taking his degree, he was attached as physician to the grenadier battalion, with a small salary. In 1781 he published the 'Robbers,' and in 1782 it was produced, with several entertainments, at Mannheim. The sensation which it excited all over Germany, more than its peculiar merits, calls for a slight notice of it. The outline of the plot is this: The Count von Moor has two sons, Karl and Franz. The younger, jealous of the love which Amalia and the Count bear to Karl, prejudices his father against him by false insinuations, and causes a letter of disinherence to be written to Karl, who is at Leipzig. Driven to desperation, this young man flies into the forest of Bohemia, and becomes captain of a band of robbers. He afterwards returns in disguise to his father's house,—hears that his betrothed Amalia has become inconstant, and that Franz has not only intercepted all letters of contrition, but has imprisoned their aged father in a tower, with a view of starving him to death. Karl releases the old man, stabs Amalia, and delivers himself up to a poor man with eleven children, that the reward for his apprehension may do good. Franz strangles himself.

The situations, the language, the characters, all partake of bombast, occasionally rising to the grand, but seldom escaping from melodrama. A comparison of the first scene with that in 'Lear,' of which it is a direct imitation, will illustrate the crudeness of the whole piece. Whirlwinds, hell, death, and despair are scattered about with exuberant hand. The pistol is to send him, "alone and companionless, to some burnt and blasted circle of the universe," where he would have "eternity for leisure to examine the perplexed image of universal woe." These two passages from the same soliloquy, illustrate the work, which is a mixture of vehement swagger and real grandeur. As acted, it is a ranting, firing melodrama, which could only have had its effect from its vehement contradiction to the cold proprieties of the German-French school, or the more humble melodrama of Lessing. It is said to be "the most stimulant tragedy extant in German literature." Indeed it pours forth a thunder of rant; it brings impossible characters into violent situations; it is full of exaggerated gigantic metaphors. It has only the excuse of boyhood and boyish enthusiasm uncorrected by experience or knowledge. Schiller himself felt all this in his after life, and in one of his letters he says, "To escape from trammels which were a torment to me, my heart fled to an ideal world; but, unacquainted with the real one, from which I was separated by iron bars, ignorant of mankind, and uninitiated to the softer sex, my pencil necessarily missed the middle line between angel and devil, and could produce but moral monsters. . . . Its fault is in presuming to delineate men before I had met one." The 'Robbers' is only interesting in connection with Schiller and with the history of German literature. The causes of its immense success were various. Respecting the revolution which it created in Germany, and (according to public report in France and England) the number of "young noblemen" which it seduced to brigandage, we may remark that the whole is an exaggeration worthy of the play itself. The intense purpose and passion of the piece produced a wide-spread sensation and many paltry imitations, but no lasting work, no lasting effect. With the natural feeling of an author, Schiller had ventured "to go in secret and witness the first representation of the 'Robbers' at Mannheim. His incognito did not conceal him, and he was put under arrest during a week for this offence." Enraged at this and other offences to his dignity as a man, worn out with the prospect of frittering away his energies in his present confined sphere, he resolved to escape, and, taking advantage of the arrival of some foreign duke at Stuttgardt, fled from the city, in the month of October 1782. Dalberg, the director of the Mannheim theatre, received him with open arms, and supplied him with money for his immediate wants. Here he began to look more calmly at his prospects, and, applying himself zealously to work, in the course of a twelvemonth produced his two tragedies, 'Fiesco' and 'Kabale und Liebe'.

'Fiesco' still has many admirers. It is melodrama, not tragedy. Yet there is fine dramatic power visible in it. The fierceness and bombast of the 'Robbers' are subdued, though still apparent, and the delineation of characters, though faulty, yet much clearer and truer than in the latter piece. Hassan the Moor is a mere exaggeration, and Fiesco's conduct and language to him equally offensive. But there are other and heavier faults, which, however, it is unnecessary to particularise. It is worthy of note that Schiller alters the historical catastrophe, and makes Fiesco fall by the hand of Varrina, the republican, because, as he very truly but rather pompously ob-

serves in the preface, the nature of the drama does not admit of the operation of chance or accident; and yet, in spite of this, he makes Fiesco kill his wife by accident. But there are many very justly admired beauties. The local colouring, that is, that painting of the historic spirit and manner which lies deeper than costume, is well produced. The catastrophe has a most solemn effect. "The midnight silence of the sleeping city," says Carlyle, "interrupted only by the distant sounds of watchmen, by the low hoarse murmur of the sea, or the stealthy footsteps and disguised voice of Fiesco, is conveyed to our imagination by a few brief touches. At length the gun is fired, and the wild uproar which ensues is no less strikingly exhibited."

'Kabale und Liebe,' with some effective points and 'situations,' is still indifferent, if not bad, and far inferior to 'Fiesco,' or the 'Robbers.' It is a household tragedy of the Kotzebue school, extravagantly written, puling with sentimentality, unreal, unpoetic, and unsatisfactory. The question of cabal and love is entirely forced from its import by a want of truth in the delineation. Considered as a drama, its construction is very faulty. These three plays all manifestly belong to the same period, and are curious as evidences of the wild enthusiasm of a young poetic spirit.

In 1783 Schiller was appointed theatre-poet, a post of respectability and reasonable profit. He translated Shakspeare's 'Macbeth,' and some French plays for the theatre, besides his other duties. In 1785 appeared the first number of the 'Thalia,' a miscellany containing essays, criticisms, &c., on the drama, edited by him, which was continued till 1794. In the first number the first three acts of 'Don Carlos' were inserted, which were highly admired. In the 'Thalia' also were published his 'Philosophical Letters.' Having rejected on the one side the arguments of the supernaturalists, and on the other those of the Spinozists, the two parties then at war, he settled into a creed in which faith and reason embrace. His creed is a sort of mystical deism, which is expressed in this one phrase, "The universe is a thought of God's." These 'Letters' remain a fragment. They are written with great power, but have little originality.

During the spring of 1785 Schiller migrated into Saxony, and settled near Leipzig. Here he wrote the 'Ode to Joy,' one of his most beautiful creations, and the novel of the 'Ghost-Seer,' which was never completed. He then went to Dresden, where he finished 'Don Carlos,' "the first of his plays which bears the stamp of full maturity." It is indeed a fine work, though deficient in unity of subject and treatment, which, as he himself remarks, results from his having delayed so long between the first part and the completion of the second. It is the most dramatic of all his plays, and the scenes between Posa and Philip, and between Philip and the Inquisitor, are among the finest specimens of dramatic writing. There is real passion beating through every vein of the work, and its situations are as effective as complex; but Schiller has himself criticised it in his 'Briefe über Don Carlos,' after which little is to be said.

In 1789 Eichhorn retired from the chair of history at Jena, and Göthe recommended Schiller to the place. Here he married Fräulein Lengefeld, and seemed at last comfortably settled. It was here, in addition to his lectures, that he worked at and published his excellent 'History of the Thirty Years' War.' The philosophy of Kant was now producing its revolution in the world of thought, and Schiller embraced it with ardour. His æsthetic essays upon Kantian principles are some of the profoundest and most important speculations on art that we have met with, particularly those on 'Grace and Dignity,' on the 'Pathetic,' on the 'Naïve and Sentimental,' on the 'Limits of the Beautiful,' and the 'Letters on Æsthetic Culture.'

In 1799 appeared 'Wallenstein.' This vast trilogy, which is his greatest work, and which in truth exhibits greater knowledge, poetic power, and mastery over materials, than his other plays, still appears to be written on a false principle. The drama is not the sphere for pure history. The local colouring is of course necessary in any historical subject, but to make this the dominant element is falsifying the first principle of the drama; yet this is what Göthe and Schiller have done, the former in 'Götz von Berlichingen' and 'Egmont,' the latter in 'Wallenstein' and 'Tell.' The historic truth of the scenes of 'Wallenstein' may be admitted, but their dramatic purpose and power are comparatively small. 'Wallenstein' is so well known through the beautiful translation of Coleridge, that we need make no further comment.

Soon after the publication of 'Wallenstein,' Schiller once more changed his abode. The mountain air of Jena was prejudicial to his lungs, and he determined to go to Weimar, where his acquaintance with Göthe ripened into friendship, and he shared with him the superintendence of the theatre. (See what Göthe says on the valuable exertions of Schiller in the remodelling of plays, in his 'Werke,' b. xxxv.)

In 1800 appeared 'Maria Stuart,' not the most successful effort of his pen: its travestie of history is ridiculous, its conception of the character of Elizabeth quite absurd, the vehement and undignified squabble between the two queens unworthy of the author; but it contains powerful writing, and is an evidence of increased knowledge of the stage. On the other hand, the catastrophe is admirable.

In 1801 was published 'Die Jungfrau von Orleans,' as direct a contrast to 'La Pucelle' as the earnestness and impassioned enthusiasm

of Schiller were to the scepticism of Voltaire. As a drama its construction is not so careful. Montgomery is episodic, and the black knight ambiguous. But a great spirit is at work; divine poetry irradiates the scene, and we rise from the perusal under the enchanter's spell. Carlyle has described the Jungfrau as possessing a keen and fervent heart of fire, which the loneliness of her life and her deep religious feelings fanned into a flame. She sits in solitude with her flocks beside the chapel under the ancient Druid oak, and visions are revealed to her such as no human eyes beheld. It seems the force of her own spirit expressing its feelings in forms which react upon itself. All this Schiller has delineated in a masterly manner. The piece had unbounded success, and on the night of its representation at Leipzig, when the curtain dropped at the end of the first act, there arose a deafening shout of "Es lebe Friedrich Schiller!" ("Long live Frederick Schiller!") accompanied by trumpets.

In 1803 he published the 'Braut von Messina,' which was an experiment to see how far a play constructed on antique principles could move a modern audience. It was a failure, although in the preface he argued the point with ability. The plot is simple. A chorus is introduced, which gives occasion to magnificent poetry; but the whole fails to move or interest. It contains parts of as fine writing as any in his works, but the whole experiment was a mistake, which a critic like himself should never have made. The form which poetry seeks for itself in any country or period is suited to that period, but not to another. He thought that if he made the sentiments and subject modern, he could with impunity, or rather with success, clothe them in ancient forms.

In 1804, a year after, "the slight degree of failure or miscalculation," says Carlyle, "which occurred in the instance of the 'Bride of Messina,' was abundantly redeemed. 'William Tell' is one of Schiller's very finest dramas; it exhibits some of the highest triumphs which his genius combined with his art ever realised." ('Life of Schiller,' p. 263.) A. W. Schlegel has also said, "The last and best of Schiller's works is 'Tell.' Here he has wholly returned to the poetry of history." ('Dram. Lect.,' ii. 392.) But the office of the drama is not and cannot be the 'poetry of history;' it is the poetry of passion in action. A drama means an action now doing, not a poetical painting of history. It is on this ground that while revelling in the delicious poetry, the exquisite painting, the truth of character and history exhibited in 'Tell,' we must condemn it as a drama. Its merits, such as they are, deserve all admiration, but as a drama it falsifies and abnegates its vital principle, and as a model it is worthless. The vital error is making the historical element, instead of the passionate, the dominant one. But there are still other serious faults of conception and construction. Not to dwell upon the superfluous episodes of Bertha and Rudenzy, and of Attinghausen, we have to remark on the error of the conception of Tell himself, the idea of which was furnished by Göthe. Tell is not a patriot, but a simple, sturdy, brave, open, resolute peasant. As a portraiture it is exquisite, but then these two serious consequences result from the conception: first, Tell has nothing intrinsically to do with the revolution of Switzerland; he is not mixed up with its hopes and interests beyond that of any other peasant, and has no more visible share in it than the killing of Gessler; secondly, Tell, not being a patriot, is no more than a murderer. This most serious æsthetic fault is inseparable from the conception. He is wronged by Gessler, and lies in wait for him in a rocky pass, and there shoots him. This is simply murder. In his soliloquy previous to the shot he nowhere indicates an intention of sacrificing the tyrant who oppresses his country and him, but simply his revenge at the man who has subjected him to shoot the apple from his son's head, and whose further hatred he dreads. Had he shot Gessler immediately after having shot at his son, we could have forgiven the excited passion of a father; but he broods over it, and lies in wait for his revenge. Gessler is a mere stage-tyrant, a devil without motive, without glimpse of character. We must observe that in the midst of all this erroneous conception there is some of his finest writing and execution, and that certain points are eminently dramatic: the scene, for instance, where Tell sits in the defile among the rocks of Küsnacht, waiting the approach of his victim, and the unconcern of the every-day travellers with their petty interests, as they pass along, contrasted with the fierce and gloomy purposes of Tell. This was Schiller's last play.

On the 9th of May 1805, after a lingering illness, he felt his end approaching. Of his friends he took a touching but tranquil farewell. Some one inquiring how he felt, he said, "Calmer and calmer;" simple words expressive of the mild heroism of the man. About six, he sank into a deep sleep; once for a moment he looked up with a lively air, and said, "Many things were growing clear and plain to him." And so he died. The great and noble spirit which animated his heart now remains to us in his works, a heirloom to posterity, familiar to every lover of poetry, and worshipped by the whole nation.

In considering his separate works, it will perhaps be thought that we have leaned too much to objection; but we have tried them by the high standard which they demanded; and as for eulogy, they have had more than enough of that. We have endeavoured conscientiously to direct the judgment of the student. A few words in general on his poetical character may not be unimportant.

What distinguished Schiller, and made him the idol of all his nation, was a fine rushing enthusiasm, an exalted love of mankind, and an earnest faith in ideal excellence. Schiller could paint little except himself; but this personality, as in the case of Rousseau and Byron, is one of the causes of his success. All his women are formed from one type. Amalia, Leonora, Louisa, Thekla, Isabella, &c., gentle, loving, affectionate beings, with little individuality, but always surrounded by the halo of a poet's ideal love. The exceptions to this are his meretricious women (Julia, Lady Milford, Princess von Eboli, and Agnes Sorrel are all of one type), and Joanna d'Arc, who is Inspiration personified. His men are either villains, lay figures, or himself. This want of pliancy of imagination is a consequence of his exclusively subjective tendency, and he has no comedy for the same reason. On this head we may contrast him with Göthe, whose objective tendency enabled him to look out upon nature, and reflect as a mirror the whole universe of things. Schiller was consequently deficient in two essential qualities of a great dramatist, that intellectual faculty which enables the poet to go out of himself, and speak through his characters as they would speak and feel; and the power of selecting a few hints to typify a character, and of avoiding all extraneous matters. Shakspere and Göthe are the two models of dramatic writing in reference to the faculty of lightly touching on every subject without exhausting it. Schiller always exhausts, and hence the length and occasional tediousness of his dialogue; he leaves nothing to the imagination. So with his pathos; he is not pathetic, because he dwells on the minutest points of suffering till our sensibility, unrelieved by the imagination, remains deadened and drowsy. Schiller says of himself that he had not Göthe's manifold richness of ideas, but that his great endeavour was to make as much as possible out of a few. This is in other words admitting his subjective and personal constitution. As a consequence he is obliged to work out his problems by means of violent contrasts, instead of evolving them from their own bases; thus Posa must be contrasted with Philip; Wurm and the President with Ferdinand; Karl von Moor with Franz; Wallenstein with Octavio; Protestantism with Roman Catholicism in 'Mary Stuart'; Republicans with the Doge in 'Fiesco.' This is the strong use of light and shade by a Rembrandt, rather than the dramatic composition of a Raffaele. Schiller's lyrics are the most perfect of his poems, because in them his own feelings only came into play. He has been called the Æschylus of Germany, with that blind designation which, seeing two points of resemblance (both being dramatists, and the most admired of their time), instantly concludes the resemblance of the whole. If compared to any one, it should be to Euripides, whom he resembles in his exhaustive, aphoristic, and rhetorical modes of writing; but he has an intensity and an earnestness which Euripides never had. His verses are in every mouth; his memory is revered; and his works, in spite of their defects, contain the purest spirit of poetry, which the world will not willingly let die.

SCHINKEL, KARL FRIEDRICH, in the opinion of his own countrymen the great architectural artist of his age, and whose name has obtained European and permanent celebrity, was born on the 13th of March 1781, at Neu-Ruppin in Brandenburg, where his father was 'super-intendent.' When only six years old he lost his father, and was placed by his mother in the Gymnasium of his native town, where he remained till the age of fourteen, when he removed to Berlin. Soon afterwards an opportunity presented itself of becoming a pupil of the elder Gilly (David Gilly, born 1745, died 1808), a clever practical man in his profession, and author of several works on subjects relating to it. Hardly could he have been more fortunately placed; for about a twelvemonth afterwards, the younger Gilly (Friedrich) returned from his travels with an imagination warmed by his recent studies, and from him it was that Schinkel derived his best instruction, and, together with an ardent relish for his art, more liberal and enlightened ideas of its powers as a fine art than were generally entertained in those days, when a system of mere routine both in theory and practice prevailed almost universally. Friedrich Gilly was a truly genial mind, who was ambitious of elevating architecture to the level of the other arts of design, and to bring it into immediate contact with them, whereas it was then, and perhaps now is, too much regarded as one entirely apart from and independent of them. What Gilly himself would have achieved in his profession can only be conjectured, for he died within two years after his return, in August 1800, before he had completed his thirtieth year, leaving Schinkel to inherit the fame that might else perhaps have been divided between them.

Although so young, Schinkel had been intrusted by Gilly to superintend the execution of some of his buildings, and after his death, he continued the engagements. Having acquired such proficiency in practice, it would not have been difficult for him to have adhered to that course under others in the profession, and in the course of time establish himself in business: but he preferred pursuing his theoretical and artistic studies; during which time he turned his exercises in them to account by making designs of various ornamental articles for modellers, metal-workers, and other artisans of that class. Out of such earnings he laid by sufficient to enable him to accomplish his cherished scheme of a pilgrimage to the "holy land of art." In 1803 he set out for Italy, first visiting Dresden, Prague, and Vienna; and after extending his route to Naples and Sicily, returned to Berlin in

the spring of 1805. But there the state of things was at that juncture anything but propitious to art, more especially architecture, to which the state of public affairs in 1806 and following years threatened a complete stoppage. He turned to landscape-painting, therefore, as an occupation and a resource, making use of the studies of scenery which he brought home from Italy, and embellishing his compositions with architectural accessories, or else making the architecture the principal and the landscape the accessorial portion of the subject. One work of note and which gained him distinction with the public was a large panorama of Palermo; and he also designed for the theatre many sets of scenes, a collection of which, including those for the *Zauberflöte*, *Die Braut von Messina*, &c., were afterwards published in a series of coloured engravings, whereby they are rescued from the usual fate of similar productions of the pencil. His various artistical labours during this period were beneficial to him in his after-career, serving as they did to call forth and exercise those two faculties in which those who are otherwise able architects are generally deficient—taste and imagination. Even had they been serviceable to him in no other respect, they were eminently so in recommending him to the king, who, as soon as restored tranquillity in public affairs permitted him to turn his attention to the improvement and embellishment of his capital, began to employ Schinkel on those structures which have stamped a new aspect on Berlin, and conferred on it a high architectural character.

One of the earliest commissions of importance which he received from the king (who was then in London with the allied sovereigns) was to make designs for a national cathedral intended to commemorate the pacification of Europe; but though the architect's ideas excited great admiration, the scheme itself was dropt. Whatever the disappointment may have been at first, he had no time to dwell upon it, for from the period of 1815 he was incessantly and most actively engaged. Among his earliest buildings were the *Hauptwache*, *Theatre*, and *Museum* at Berlin, all of them treated in a pure Hellenic style—a style which had only been hinted at in such previous attempts at correct Grecian architecture as Langhans's once celebrated 'Brandenburg Gate.' The facade of the Museum more especially displays, together with severe simplicity of outline, a fulness of refined ornamentation unknown to and unthought of for any previous modern example which is called Greek. The external elevation consists of merely a single line of eighteen columns in antis (*Erechtheum* Ionic) raised on a lofty stylobate, in the centre of which is a flight of steps, inclosed by pedestal walls (in continuation of the stylobate) and forming the ascent to the colonnade. Taken by itself however, there would be nothing very remarkable in the general idea, whereas an extraordinary degree and kind also of variety and effect are given to the whole by the inner elevation or background behind the outer row of columns; which presents in the centre portion of it a second colonnade (four columns in antis), with a screen-wall rising about half of its height, and above and beyond that the upper part of the open staircase, whereby the whole composition acquires singular movement and play both of perspective and light and shade; besides which the wall forming the rest of this inner elevation, instead of being left a blank surface, or nearly so, is completely decorated from top to bottom, the upper division of it on each side of that inner colonnade being filled up by a single large fresco, the cartoons or designs for which were prepared by Schinkel himself, and have been executed under the direction of Cornelius.

Schinkel's ideas are exhibited to us in his 'Entwürfe,' an unusually full and extensive series of designs of all his principal buildings, some of which are illustrated and explained far less sparingly than is the custom in similar collections; for besides ornamental details, many of them strikingly original as well as tasteful, perspective views interior as well as exterior, and different ones of the same building are given; besides which, the engravings themselves are illustrated by the information contained in the letter-press. The publication of his designs contributed no doubt to spread Schinkel's fame much more rapidly than would otherwise have been the case; and the work is one that forms a very complete gallery of his unusually numerous and no less varied architectural productions. With such ready materials, a descriptive catalogue of his buildings might be easily drawn up, but we can merely mention a few of them: the *Werder Kirche* (Gothic), *Bauschule*, and *Observatory*, at Berlin; the *Theatre* at Hamburg; *Schloss Krzesowice*, *Charlottenhof*, and the *Nicolai Kirche* at Potsdam, which last would have been a most imposing structure had the design been carried out, instead of being cut down altogether by the omission of the cupola. His 'Entwürfe' also contains his design for the *Sing-Academie* at Berlin—one of his happiest ideas, which was unfortunately set aside for that by Ottmer [OTTMER, K. T.]; and six several designs for a monument to Frederick the Great, in which he gave free scope to his imagination, and indulged in luxurious architectural pomp. Another publication, entitled '*Werke der Höheren Baukunst*,' gives us a series of designs by him for the *Palace* at Athens, which he proposed to erect upon the *Acropolis*, forming an irregular assemblage of courts, colonnades, and buildings, some of which, especially one magnificent saloon, would have been marked by originality of character as well as by striking effect. His design was much superior to that by Klenze, which is also published among those of the latter architect's; but neither of them was adopted: the present barrack-like edifice is from the design of Gürtner. Another remarkable project of Schinkel's

his latest though not least poetical conception, was a design for a summer palace at Orianda, in the Crimea, for the Empress of Russia, surrounded by terraces and hanging gardens on a lofty eminence, commanding a prospect of the Black Sea. That was in 1839, the same year in which was conferred upon him the highest rank in his profession—that of Ober-Landes-Bau-director; but it was to him a mere honour, for his career was closed: his health immediately afterwards began to decline, and in the autumn of the following year, on his return from the baths, by whose waters he had hoped to benefit, he was attacked by an organic affection of the brain, which reduced him to a state of almost complete insensibility to all external objects; and in that deplorable condition he remained upwards of a twelvemonth, till released from it by death on October 9th, 1841.

Schinkel has been called by some of his countrymen the Luther of Architecture; and he certainly gave a fresh impulse to the art: and if he himself did much, his example and influence have perhaps accomplished more; for by venturing to think for himself, he has led others to do the same. Yet with all his freedom and originality, he was, perhaps, rather too timid than too bold in his reforms, adhering in many respects too strictly to the original letter of Grecian examples, particularly in regard to the orders. As to Gothic, it would have been better had he abstained from it entirely, and given his undivided attention to the other style, first eliciting and then maturing new ideas from it. With all his invention, too, he exercised none upon such important features as doors and windows, for which he repeats the very same design again and again in different buildings.

Schinkel has been made the subject of biographical notice and of criticism more than any other modern architect. Of two separate publications relative to him, one entitled 'K. F. Schinkel, Eine Charakteristik,' &c., 1842, is by Dr. Kugler; the other by O. F. Gruppe.

SCHLEGEL, JOHANN ELIAS, was the eldest of three brothers, all of whom distinguished themselves by their literary exertions, and acquired some celebrity for a name which has since been rendered more illustrious by two writers (also brothers), August Wilhelm and Friedrich von Schlegel. Johann Elias was born at Meissen, where his father was 'appellations-rath,' January 28th 1718. At the age of twelve he began to display a taste not only for reading but composing poetry; and was greatly encouraged in his studies by his father, who was himself a man of superior capacity and of a very literary turn. While he was at the university of Leipzig, his talents recommended him to Gottsched, then looked up to as the arbiter in matters of poetical taste, to whose 'Kritischen Beiträgen,' &c., he contributed several pieces, as he did also to the miscellany entitled 'Belustigungen des Verstandes,' &c., besides writing various dramatic compositions. Neither did he neglect his severer academical studies, but on the contrary applied to them with great diligence; as he did likewise to French, English, and Italian literature. On quitting Leipzig, he accompanied Von Spener (who had married his uncle's widow) to Copenhagen as his secretary, the latter being sent as envoy to the court of Denmark. All his leisure from his official employments he now devoted not only to studying the language thoroughly, but to making himself acquainted with the history and condition of the country, both by reading and conversation. The information he thus collected, together with his own remarks, he gave to the public in the form of a weekly periodical, entitled 'Der Fremde,' which obtained for him considerable notice. He afterwards became acquainted with Holberg, who procured him the professorship of modern history and the appointment of librarian at the academy of Soroe, founded by himself. [HOLBERG.] But his excessive application to his duties and to his private studies proved too much for his constitution, which was not a very strong one, and in the course of the following year he was carried off by a fever, August 13th 1749, at the age of thirty-one. A complete edition of his works, in 5 vols., was published by his brother Johann Heinrich, 1761-70.

JOHANN ADOLPHUS, the second brother, born at Meissen, September 18th 1721, studied at Leipzig with Elias, and, like him, then began to make himself known in the literary world by his contributions to the two publications above mentioned. For a time he bestowed far more attention on merely literary pursuits than on the studies more immediately connected with his future profession; but if he did not distinguish himself by profound theological learning, he acquired very great popularity as a preacher, both by the style of his sermons and by his emphatic and animated delivery. At Zerbst, where he was pastor primarius, and professor of theology and metaphysics, from 1754 to 1759, he was frequently called upon to preach before the court. Of his pulpit compositions, several collections appeared at different times, the earliest being that in three volumes, 1754-58. As a poet he must be estimated rather according to the standard of his own day than that of the present. He may rank among those who exerted themselves to introduce a better taste; and his odes, and religious and moral pieces, though by no means free from defects, abound with fine passages. He survived both his brothers many years, not dying till September 16th 1793. His sons are noticed below.

JOHANN HEINRICH, born in 1724, studied, like his brothers, at Leipzig, and through the influence of Elias, obtained an appointment as secretary in the chancery at Copenhagen. He afterwards became

professor of history at the university there, and Danish historiographer-royal; and died in that capital, October 18th 1780. Although not so distinguished as either of the preceding, he was a writer of some ability, and published a history of the sovereigns of Denmark of the house of Oldenburg, and several other works relative to that country. He also translated Thomson's 'Sophonisba' and some other tragedies from the English.

SCHLEGEL, AUGUST WILHELM VON, the son of John Adolphus Schlegel, noticed in the preceding article. John Adolphus had four sons—Charles Augustus Maurice, superintendent-general at Harburg in Hanover, who died in 1826; John Charles Fürchtegott, one of the councilors at the Ecclesiastical Court at Hanover, and known as the author of 'Hanoversches Kirchenrecht' ('The Ecclesiastical Law of Hanover'), 3 vols. 8vo, 1801-5, and 'Das Kirchenrecht von Nord-Deutschland' ('The Ecclesiastical Law of Northern Germany'), 3 vols. 8vo, 1823-32, &c., who died in 1831; Augustus William, the subject of this sketch; and lastly, Frederic Charles William, who obtained a fame still more solid though less brilliant than his eldest brother.

Augustus William Schlegel was born at Hanover, on the 8th of September 1767, and after having received a careful education was sent to Göttingen to study divinity, which he soon abandoned to devote his time to philology. Though young, he was no common classical scholar, for his Latin dissertation on the geography of Homer was highly thought of by Voss, the most competent judge of his age on that subject, and Heyne intrusted him with making an index to his edition of Virgil. For some years Schlegel lectured at the University of Göttingen: his contributions to Bürger's 'Akademie der Schönen Künste' (especially his poem 'Ariadne,' and his essay on Dante), and to Schiller's 'Musen-Almanach' and 'Horen,' especially his translations from Dante with commentaries, secured him an honourable rank among the best writers of Germany. In 1797 he published the first volume of his translation of Shakspeare. In the same year he was appointed professor of Humaniora in the University of Jena, and, continuing his literary activity, he soon placed himself among the leaders of German literature. He remained at Jena till 1802, a friend of Schiller, and an admirer of Göthe, then at Weimar, who however did not return the sentiment.

Pushed by ambition, Schlegel left the little town of Jena, and repaired to Berlin, where he gave public lectures to a mixed but highly intelligent public on literature and the fine arts. He remained there till 1805, having meanwhile imbibed that puerile passion for little court distinctions, titles, and crosses, which in later years proved such a drawback on his real merits. Among the specimens of his literary activity in the period from 1797 to 1805, may be mentioned, besides the continuation of his translation of Shakspeare's plays, the 'Athenaeum,' a critical review, which he edited with his brother Frederic, and which did a great deal of good towards purifying the taste of the public; 'Gedichte' (Poems), Tübingen, 1800; 'Musen-Almanach,' which he edited together with Tieck, and in which he first betrayed his growing tendency towards Roman Catholicism and mysticism; 'Vorlesungen über Literatur und Kunst des Zeitalters' ('Lectures on the Literature and the Fine Arts of the Age'), which appeared in the 'Europa,' a review edited by Frederic Schlegel.

In 1805 he made the acquaintance of Madame de Stael-Holstein. Surprised at finding so rare a combination of deep learning, uncommon poetical talents, and the manners of a courtier as Schlegel presented, she became his sincere friend, and he henceforth accompanied her during several years on her travels through various parts of Europe. The reciprocal influence of these two distinguished persons upon each other was very great, and may be traced in their works: the result was, that he made her popular in Germany, and she brought him out in France, where his vanity afterwards met with so much gratification. At her suggestion he published in French a comparison between the Phædre of Racine and the Hippolytus of Euripides, and this work was the foundation of his subsequent fame among the French. In 1808 Schlegel delivered at Vienna a course of lectures on dramatic art, which are an everlasting monument of his genius. They were published under the title 'Vorlesungen über Dramatische Kunst und Literatur,' Heidelberg, 3 vols. in 8vo, 1809-1811; 2nd edition, 1817. A new collection of his poems appeared in 1811, 2nd edition, 1820, among which are his masterpieces, Arion, Pygmalion, Saint Lucas, and others. At that time Schlegel and his brother Frederic had already succeeded in founding, in opposition to the models commonly called classical, the modern romantic school of poetry and fine arts which had its origin, in a great measure, in the depressed state of Germany and the deep wishes of the people for a moral, religious, and political regeneration. The brothers Schlegel were considered as enthusiastical patriots, and Augustus William having ventured to depreciate the French drama and to call Molière a mountebank, at a time when such liberties met with punishment or cruel persecution from the French invaders, his name became popular to a degree which he would perhaps not have enjoyed at another time. 'Das Deutsche Museum,' a review which the brothers Schlegel founded in 1812, was the chief organ of the new school, and the middle ages became the inexhaustible source where the reformers quenched their thirst for piety, sentimentality, and chivalry, and whence they drew forth everything except that rude power softened down by uncorrupted

feelings which forms the true character of that age. Göthe, who never called himself a romantic poet, but was nevertheless the first of all, knew that character much better than the devout Frederic, or the somewhat effeminate Augustus William Schlegel. The excitement of 1819 produced a strange effect upon Augustus William: he accepted a secretaryship from Bernadotte, the crown-prince of Sweden, and wrote political essays. No sooner however was Paris taken than he repaired to the country-seat whither Madame de Stael had retired, and kept her company till her death in 1818. She remembered him in her will. About that time he was placed among the titular nobility of Germany, the privilege of which consists in putting the preposition 'Von' between the Christian and the family name of the person thus distinguished.

In 1819 Augustus William von Schlegel was appointed professor of history in the University of Bonn, which had just been founded by the king of Prussia: it is not known why he was made professor of history, for he had never written on history. He had now ceased to be a poet, but still ambitious of the honour of being a European author, he published several critical essays—of undoubted merit however—in foreign languages. Such are—'Le Couronnement de la Ste. Vierge, et les Miracles de St. Dominique: Tableau de Jean de Fiesole; avec une Notice sur la Vie du Peintre,' fol., Paris, 1817; an essay on the famous Venetian horses, which he declared to be of Greek workmanship, in Italian, in the 'Biblioteca Italiana'; 'Réflexions sur l'Etude des Langues Asiatiques, adressées à Sir J. Mackintosh, suivies d'une Lettre à Mr. H. H. Wilson,' Bonn, 1832, &c. To such minor works however he devoted only part of his time, for even previous to his appointment at Bonn, and at the suggestion of his brother Frederic, he had made up his mind to study Sanskrit. He soon attracted a small number of students round him, and thus became one of the principal promoters of the study of that language in Germany: the Sanskrit printing-office at Bonn owes its foundation to Schlegel, who, it is said, purchased the types at his own expense. Although he did not attain the exact knowledge of that difficult language by which Bopp and Lassen have distinguished themselves, he was yet no contemptible Sanskrit scholar, and surpassed Bopp and others in his general views: and it may be said that his principal merit consisted in encouraging students and aiding them in pursuing the study of the Sanskrit, Zend, Pehlvi, and other Indo-Persian languages. Schlegel in his turn was assisted by the superior learning of Professor Lassen. As early as 1820 he founded the 'Indische Bibliothek,' a review exclusively devoted to Indian languages and antiquities. Specimens of Schlegel's Sanskrit scholarship are—'Ramáyana,' with a Latin translation and critical notes, Bonn, 1829; 'Bhagavad-Gita,' an episode of the celebrated Indian epic 'Mahabharata.' It is especially to his endeavours to promote the study of the Indian languages, as well as to some of his critical essays on subjects connected with the fine arts and poetry, that Schlegel owes the great esteem which he enjoyed in this country. Some time before his death, which took place on the 12th of May 1845, he published 'Essais littéraires et historiques,' 8vo, Bonn, 1842.

Schlegel ranks high among the lyric poets of Germany. 'Arion' is a wonderful romance or ballad, if the expression can at all be applied to such a production; and his sonnets are little pieces of perfection. The smoothness of his style, and his elegant clearness, have not been surpassed in Germany. But as a genius he stands far below the great leader of German literature; he could appreciate the grand and sublime, but he was unable to create it, as his tragedy of Ion shows. He must have felt his own comparative weakness when he called Göthe a god. Next to Count Platen, Schlegel was the most perfect metrist; but feeling his superiority in this respect he made too much of it, and sometimes produced most musical sonnets, embodying feelings of such an exquisite delicacy as to leave no impression whatsoever upon the mind of less gifted mortals than the author. His translation of Shakspere, which was continued by Tieck, is the best among the numerous German translations of the great bard; but Tieck's translations are still better than those of Schlegel, whose version is too elegant, too elaborate, too smooth: his Falstaff, and the like characters, leave an impression as if previous to appearing in public they had received some private lessons from the accomplished translator to behave with decency in his and his equals' company. The work which perhaps does him most credit is the 'Lectures on Dramatic Art and Literature,' which have been translated into all the modern languages: into English by John Black, 3 vols. 8vo, London, 1840, reprinted in one volume in Bohn's 'Standard Library,' 1846. In his criticism on the French drama he is however one-sided. His appointment as professor of history at Bonn was a mistake: he ought to have remained at Berlin, or Vienna, lecturing before an elegant public of fashionable ladies and gentlemen. Vexed at seeing in Niebuhr, then likewise at Bonn, a star still brighter than his own, he endeavoured to darken him since he could not outshine him, and wrote his critique of Niebuhr's Roman history, which appeared in the 'Heidelberger Jahrbücher' of 1828; and he likewise began to lecture on Roman history in the university: but his critique made him ridiculous among the learned, and his lectures added nothing to his reputation.

SCHLEGEL, FRIEDRICH CARL WILHELM VON, brother of the preceding, was born at Hanover on the 10th of March 1772. Frederic Schlegel received a very liberal education, although his father wished him to engage in mercantile pursuits. Accordingly he was

placed as apprentice in a mercantile house at Leipzig, but he showed so little inclination and ability for the business that the father sent him to Göttingen to study philology, though in the course of his education he had not shown any promising talents. After a year's residence in this place, Schlegel went to Leipzig, where he continued his studies with such zeal, that on leaving the university he had read all the important ancient writers in the original language.

His first publication of any importance was 'Griechen und Römer,' Hamb., 1797, of which his 'Geschichte der Griechen und Römer,' Berlin, 1798, may be considered as a continuation. This was only a fragment, and it has never been completed. At this time all his thoughts seem to have been absorbed by ancient literature, with which, as his early works show, he had formed a most intimate acquaintance. About the same time he undertook, together with Schleiermacher, to translate Plato into German; but after the first sheets were printed he abandoned the undertaking, and left the whole in the hands of Schleiermacher. In 1796 he began editing, with his brother August Wilhelm, a literary periodical called the 'Athenaeum,' of which however only three volumes appeared. The object of this publication was to produce an entire change in the literature of Germany. It was of a polemical character, and directed against the most popular authors of the time, especially Kotzebue and Iffland. The papers which it contained were very valuable, but written in an arrogant and contemptuous tone. Another work with the same object was 'Kritiken und Charakteristiken,' which he likewise edited with his brother. In 1799 Schlegel published at Berlin the first volume of a novel called 'Lucinde,' which created a great sensation. It was admired and commended by men of the highest eminence, such as Schleiermacher, while it was most severely censured by others, who saw in it nothing but an exaltation of sensual pleasure. The justice of the censure appears to have been felt by Schlegel himself, for he never completed the work.

In 1800 Schlegel left Berlin and went to Jena, where he delivered a course of lectures on philosophy, which were received with great applause. In 1802 he published at Berlin a tragedy called 'Alarkas,' grand in its conception, but romantic and rather mystic in its whole character. In the same year he travelled with his wife, the daughter of the celebrated M. Mendelssohn, to Paris, where he delivered lectures on philosophy, and edited a monthly periodical called 'Europa,' of which only two volumes appeared. (Frankfurt, 1803-5.) At Paris he also studied the arts, the languages of Southern Europe, and more especially the language and literature of the ancient Indians. The fruits of the latter study appeared in his little essay, 'Ueber die Sprache und Weisheit der Indier,' Berlin, 1808, one of the first works which appeared in Germany on the literature of India: it had great defects, and among others it contained the usual exaggerated notions respecting the civilisation of the Indians. The results of his other studies at Paris may be seen in his 'Geschichte der Jungfrau von Orleans,' Berlin, 1802; 'Sammlung romantischer Dichtungen des Mittelalters,' Berlin, 1804; and 'Lothar und Maller,' Berlin, 1805. After his return to Germany he published a collection of his poems, Berlin, 1809, which are partly of a dithyrambic and partly of an elegiac character. All these works, as well as his 'Poetisches Taschenbuch,' Berlin, 1806, and his epic poem 'Roland,' show the author's deep veneration for the arts, the poetry, and the whole social life of the middle ages. This feeling had taken strong hold of him, as appeared more manifestly from his wife and himself embracing the Roman Catholic religion at Cologne in 1808.

He now went to Vienna, where, in 1809, he was appointed imperial secretary at the head-quarters of the archduke Charles, and in this capacity he exercised a great and beneficial influence upon the national spirit of the Germans by his inspiring proclamations. After the political wreck of Austria he returned to his literary occupations, and delivered a course of lectures on modern history ('Ueber die neuere Geschichte,' published at Vienna, 1811), and on the history of ancient and modern literature ('Ueber die Geschichte der alten und neuen Literatur,' published at Vienna, 1815, in two vols.). The latter work has been translated into English. In the years 1812 and 1813 he edited the 'Deutsche Museum,' of which only two volumes appeared. Schlegel also tried his strength as a politician and diplomatist, and his writings on subjects of this kind were so highly valued by Prince Metternich, that he appointed him councillor of legation to the Austrian embassy at the German Diet at Frankfurt. But he resigned this office in 1818, and returned to Vienna, where he began to edit a new periodical called 'Concordia,' Vienna, 1820-21, with a view of reconciling the various opinions respecting church and state. About this time he also began to prepare a complete edition of his scattered works, which was published in twelve vols., Vienna, 1822, &c. In 1827 he delivered a course of lectures on practical philosophy ('Philosophie des Lebens,' published at Vienna, 1828), and in 1828 another course on the philosophy of history ('Philosophie der Geschichte,' Vienna, 1829, 2 vols.): both these works have been translated into English. Towards the close of this year Schlegel made a journey to Dresden, with a view to deliver a series of lectures on the philosophy of language, but while he was working them out, he died, on the 12th of January, 1829. The Dresden lectures, as far as they were finished, were published in 1830 at Vienna, under the title of 'Philosophische Vorlesungen, insbesondere über die Philosophie der Sprache und des Wortes.' His friend Pro-

fessor Windischmann of Bonn undertook the editorship of such works as were left in MS., and the first vol. appeared at Bonn in 1836, under the title of 'Philosophische Vorlesungen aus den Jahren 1804-6, nebst Fragmenten, vorzüglich Philosophisch-theologischen Inhalts.' The death of Windischmann has prevented the completion of this collection, but a complete edition of the works of Friederich Schlegel has been published at Vienna in 15 volumes, 8vo.

Frederic von Schlegel, together with Tieck and Novalis, were, at the end of the last and the commencement of the present century, at the head of a literary revolution in Germany, which endeavoured to promulgate its principles in the two works above mentioned, the 'Athenæum' and 'Kritiken und Charakteristiken.' The new school which these writers endeavoured to establish is characterised by the name of the *Æsthetic-critical*, or that of the *romantic* school of poetry. The predilection for the middle ages and Roman Catholicism was common to all of them, but in none of them so strong as in Frederic von Schlegel, who would gladly have restored the middle ages, with their arts, their literature, and their religion. This tendency, and the great names by which it was supported, led to very injurious consequences; but some writers of this school have produced poems which will live as long as the German language, and to their exertions we are indebted for a more correct knowledge of the nature of romantic poetry, and its relation to the antique or classical poetry. These writers also established the fact, that the middle ages, though generally looked upon with contempt, were not all darkness. But whatever may be the errors into which Schlegel was led by his peculiar turn of mind, no one has ever accused him of insincerity. It has indeed sometimes been said that he should not have lent himself as an agent to the Austrian government. Now it is true that he did so, but this should not be made a particular charge against him, as it was a natural consequence of his general views and principles. The poetical works of Frederic von Schlegel are of less value than his critical and philosophical writings, which are distinguished by acuteness, profundity of thought, and great learning. His style however is not always as clear and lucid as that of many of his contemporaries. Translations of Schlegel's Lectures on the Philosophy of Life, Philosophy of History, Philosophy of Language, and History of Literature, and his 'Æsthetic and Miscellaneous Works,' form four volumes of Bohn's 'Standard Library.'

SCHLEIERMACHER, FRIEDRICH ERNST DANIEL, was born on the 21st of November 1768 at Breslau. His parents belonged to the religious sect called Moravians, and the son accordingly received his first instructions in the educational establishment of that body at Niesky. He began his theological studies at Barby, where the Moravians possess a seminary for young theologians. But when he was eighteen years old he left this sect, and began a fresh course of study in the University of Halle, where he devoted himself with no less zeal to the study of philology than to theology, though the latter department was that to which he intended to devote his life, for he was thoroughly convinced that theological studies cannot be pursued with advantage without a knowledge of antiquity and its literature.

In 1790, when he had finished his studies, he undertook the education of the children of Count Dohna-Schlobitten, who lived at Finkenstein in Prussia. He did not however remain long in this situation as private tutor, but went to Berlin, and was for some time engaged as teacher in the seminary for teachers, which was then conducted by Gedike. In 1794 he was appointed assistant preacher at Landsberg on the Warthe, but two years after he returned to Berlin, where he was engaged as preacher to the great hospital called the 'Charité,' until the year 1802. Here he became acquainted with the theologian F. S. G. Sack, who was then engaged in translating Blair's 'Sermons' into German (Leipzig, 5 vols., 1781-1800). Schleiermacher took an active part in this undertaking, and the greater part of the last volume was translated by him alone. On the suggestion of Sack he also translated Fawcett's 'Sermons,' Berlin, 2 vols., 1798. The first original works of Schleiermacher were some essays in the 'Athenæum,' which was edited by the Schlegels. [SCHLEGEL, F. VON.] Among the papers which he contributed to this publication were his 'Vertraute Briefe über die Lucinde' ('Confidential Letters on the Lucinde'), a novel of Fr. von Schlegel. They were published without the author's name, and bestowed the highest commendation on the novel, though it seems to be clear that Schleiermacher was not aware of the dangerous principles that lay at the bottom of the work which he praised. Soon after the death of Schleiermacher these letters were republished by Carl Gutzkow (Hamburg, 1835), one of the writers of the school called Young Germany, with the malignant intention of vilifying the character of their author, and of drawing censure upon him for long-forgotten youthful aberrations. This publication at first created a very great sensation, but the voice of Germany rose against the unworthy conduct of Gutzkow, and the work has since fallen into well-deserved oblivion.

In 1799 Schleiermacher published his 'Discourses on Religion' ('Reden über die Religion, an die Gebildeten unter ihren Verächtern'), a third edition of which appeared in 1821, with notes. These discourses contain some of the finest specimens of German oratory, are full of profound thoughts, and more calculated than any other work to convince the educated classes of society of the necessity of religion. In 1800 he published a work called 'Monologen, eine Neujahrsgabe'

(a fourth edition of which appeared at Berlin in 1829), and 'Briefe eines Predigers ausserhalb Berlin.' The last of these two little works was a reply to a public letter (Sendschreiben) addressed by some Jews to the Protestant theologian W. A. Teller. About this time Schleiermacher conceived the plan of translating with Fr. Schlegel the works of Plato, and when Schlegel abandoned the undertaking, Schleiermacher continued it by himself. This translation, which however unfortunately does not comprehend all the works of Plato, appeared at intervals, from 1804 to 1828, and consists of 3 vols., in 6 parts. A second edition of the first 5 parts appeared at Berlin from 1817 till 1827. This translation of Plato is the most correct and most beautiful that has been published in any European language. Each of the dialogues is moreover preceded by a very valuable introduction, in which the author develops the spirit and principle of the dialogue. These introductions, some of which have been translated into English, show that Schleiermacher was deeply acquainted with the spirit of the Platonic philosophy. In 1801 he published his first collection of sermons, a third edition of which appeared in 1816. This collection of sermons was in subsequent years followed by six other collections, which were published between the years 1808 and 1833. Of the second, third, and fourth collections, second editions appeared in 1816-26. All these collections together make seven small octavo volumes. Besides these collections Schleiermacher published a great number of single sermons delivered on particular occasions. All the sermons of Schleiermacher are distinguished for a clearness and perspicuity of style and thought such as are seldom found in any modern writer of sermons. Their prevailing characteristics are, that they address themselves more to the understanding of his hearers than to their feelings or imagination, whence Schleiermacher and his followers have been designated by the name of the 'Denkgläubigen,' in contradistinction from the 'Wort- or 'Altgläubigen,' and the mystical Pietists. In 1802 Schleiermacher went to Stolpe with the title of court preacher, and here he wrote an admirable work called 'Grundlinien einer Kritik der bisherigen Sittenlehre,' Berlin, 1803, a second edition of which appeared in 1834, and another called 'Zwei unvoregreifliche Gutachten in Sachen des Protestantischen Kirchenwesens,' Berlin, 1803. The latter work appeared without the author's name. He had not been long at Stolpe when he received an invitation to a professorship in the University of Würzburg, but he declined the offer at the request of the Prussian government, which in return appointed him professor of theology and philosophy in the University of Halle (1802).

After the political catastrophe of 1806, when Halle was made a part of the new kingdom of Westphalia, Schleiermacher went back to Berlin, where he began to deliver public lectures on theological and philological subjects. During this period of the political humiliation of Prussia, Schleiermacher showed himself a true patriot, and in the pulpit, as well as on other occasions, he fearlessly endeavoured to rouse the spirit of his hearers against the foreign oppressors. During this period he wrote the following little works:—'Die Weihnachtsfeier, ein Gespräch,' Halle, 1806, 2nd edition, Berlin, 1827; 'Ueber den sogenannten ersten Brief des Paulus an den Timotheus,' Berlin, 1807; 'Gelegentliche Gedanken über Universitäten im deutschen Sinne,' Berlin, 1808; and an essay on Heraclitus, which appeared in F. A. Wolf's 'Museum der Alterthumswissenschaften.' In 1809 Schleiermacher was appointed preacher at Trinity Church in Berlin; and in 1810, when the new university of that capital was opened, he was appointed professor of theology, and at the same time he began to take an active part in the business of the ministry for public instruction. His lectures in the university gained for him universal admiration, for here he combined with the great oratorical powers which he had already displayed in the pulpit, profound thought and the most extensive learning; here he had an opportunity of unfolding all the treasures of his mind, and he followed out the most abstruse investigations into their minutest details with luminous order and distinctness. In 1811 he was created a member of the Academy of Sciences at Berlin, and furnished some of the best papers on various subjects, but especially on particular points of the history of ancient philosophy. They are published in the 'Transactions' of the Academy. In 1811 Schleiermacher published 'Kurze Darstellung des Theologischen Studiums.' In 1814 he was made secretary to the philosophical section of the Academy, and on this account he was released from his duties in the ministry for public instruction.

During the period which now followed, Schleiermacher was partly engaged in new editions of former works, or their continuations, and partly in publishing a number of smaller polemical writings, especially against F. A. H. Schmalz and C. F. von Ammon. Among the greater works which he wrote during the last period of his life we shall mention 'Ueber die Schriften des Lukas, ein Kritischer Versuch,' Leipzig, 1817, which was translated into English in 1825, and 'Der Christliche Glaube, nach den Grundsätzen der Evangelischen Kirche im Zusammenhange dargestellt,' Berlin, 1821-22, 2 vols., a second edition of which appeared in 1830. In the autumn of the year 1833, Schleiermacher visited England, and opened the new German chapel at the Savoy. He died on the 12th of February, 1834. The whole of the works of Schleiermacher have been collected and published since his death (1835, &c.), in three sections. The first section (called 'Zur Theologie') contains, in four volumes, those

theological works which are of a scientific character; the second (also called 'Zur Theologie') contains his sermons, in four volumes; the third (called 'Zur Philosophie') contains his philosophical works, in five volumes. The works which Schleiermacher left in MS. were edited by Zabel, Berlin, 1835, 2 vols. 8vo.

Schleiermacher was equally great as a theologian, a philologist, a critic, an orator, and a translator; and the influence which his writings had on the intellectual part of Germany was and is still exceedingly great, but it was far surpassed by that which his oral instruction, and the purity, piety, and sanctity of his personal character exercised over those who had the happiness to live near him. Our space does not allow us to enter into an examination of his theological system, which is most amply explained in his 'Der Christliche Glaube.' It may be sufficient here to state, that he neither belonged to the old superstitious and word-splitting school, nor to the modern Pietists or Rationalists.

\*SCHLOSSER, FRIEDRICH CHRISTOPH, was born at Jever, in the lordship of Kniphausen, on the 17th November, 1776, the youngest child of a numerous family. On the early death of his father he was taken by a relative and educated in the country, where at the village school he read many travels and geographical descriptions. He afterwards attended the gymnasium at Jever, and in 1793 proceeded to the University of Göttingen, where, together with theology, he studied history, physics, and mathematics, and subsequently the literature of Italy, Spain, and England. On leaving the university he became tutor to the children of Count von Bentinck, the sovereign lord of Kniphausen, and while in this situation he diligently studied philosophy, particularly Plato and Kant. In 1798 for six months he acted as substitute or curate for a village preacher, but as he did not succeed in getting any other appointment, he resumed his former occupation of teacher, first at Altona, and then at Frankfurt-am-Main. While so employed he continued to pay attention to literature. In 1807 he published, at Gotha, 'Abälard und Dulcin.' In 1808 he was appointed con-rector of the school at Jever, a post which he resigned in the following year because it interrupted his historical studies, and in the same year he published his 'Leben Beza's und des Peter Martyr Vermili.' He then settled at Frankfurt-am-Main, gave lessons at the Gymnasium, and laboured at his 'Geschichte der bilderstürmenden Kaiser des oströmischen Reichs' ('History of the Iconoclast Emperors of the Eastern Empire'), which was published at Frankfurt in 1812. The work established his reputation, and the Prince Primate of the Confederation of the Rhine made him professor of the newly-established Lyceum at Frankfurt. On its suppression in 1814 he was elected city librarian. In 1817 he was called to the University of Heidelberg, in the duchy of Baden, as professor of history, and here he had also at first the management of the library, which after a few years he resigned. In the same year he commenced publishing his 'Weltgeschichte in zusammenhängender Erzählung' ('History of the World in a connected relation'), of which eight parts, forming four volumes, were published between that date and 1841. In 1822 he made a journey to Paris to collect materials for his history, and in 1823, urged, he says, by representations from many quarters, he left the completion of his larger work, and published in two volumes the 'Geschichte des 18 Jahrhunderts' ('History of the Eighteenth Century'), subsequently enlarged in later editions to 'Geschichte des 18 Jahrhunderts, und des 19 bis zum Sturz des Französischen Kaiserreichs' ('History of the Eighteenth Century, and the Nineteenth, till the fall of the French Empire') in 6 vols., published between 1843-46. These are his most important works. In range of view and extent of knowledge, in the thorough command of his materials, in insight into character, and in power of expression, he ranks with the best of modern historians. In his history of the eighteenth century his acquaintance with and his judgment of the literature of England is remarkable for its depth and its general correctness, and his sketches of the political characters and parties are distinguished by their vigour and impartiality. An English translation of this work has been published in 7 volumes, under the title of 'History of the Eighteenth and Nineteenth Centuries.' In 1824 he was rewarded with the title of counsellor, and shortly after of privy counsellor. His other works have been 'Universal-historische Uebersicht der Geschichte der alten Welt und ihrer Cultur' ('Universal historical abstract of the history of the ancient World and its civilisation'), in 3 volumes, 1726-34; 'Zur Beurtheilung Napoleon's und seiner neuesten Tadeln und Lobredner, besonders in Beziehung auf die Zeit von 1810-13' ('Critical Examination of Napoleon, and of his latest censurers and eulogisers, especially with reference to the period from 1810 to 1813'), 1832-5. He also, in conjunction with Kriegk published 'Weltgeschichte für das deutsche Volk' ('A History of the World for the German People'), 1844-6, and, with Bercht in 1830 the 'Archiv für Geschichte und Literatur.'

SCHLÖZER, AUGUST LUDWIG VON, was born on the 5th of July 1737, at Jagstadt on the Jaxt, in the principality of Hohenlohe-Kirchberg. His father died very early, but the boy received a good education, and in 1751 was sent to the university of Wittenberg to study theology. Here he conceived a most ardent wish to travel into Asia, and for this purpose he began the study of Oriental languages. In 1754 he went to Göttingen, where he continued the study of theology for two years, at the end of which time he engaged himself as tutor to a Swedish family, with which he went to Sweden. He spent three years and a half partly at Stockholm and partly at Upsala.

Although theology had been his principal study, Schlözer opened his literary career with a 'History of Commerce,' in Swedish ('Versuch einer Handelsgeschichte,' Stockholm, 1758), and history henceforth became his favourite pursuit. In 1759 he returned to Göttingen, and now began seriously to prepare himself for his journey to Asia by intense application to the Eastern languages and to the study of medicine. But in 1761, Müller, the historiographer of the Russian empire, offered him the place of tutor to his family, and of a literary assistant in his own pursuits, at the same time holding out to Schlözer the hope of obtaining a professorship in the academy of St. Petersburg, and the support of the government for his intended journey. These hopes induced Schlözer to accept the offer. On his arrival in St. Petersburg he immediately began to study the Russian language and the history of the empire; but his great progress provoked the jealousy of his principal, and rendered the situation of Schlözer very unpleasant. In 1762 Schlözer was made adjunctus to the academy and teacher in a public establishment, which induced him to quit his place in the house of Müller, who now became his avowed opponent. Michaelis of Göttingen, in the meanwhile, had not forgotten his young friend, and it was through his influence that in 1764 a professorship in the university of Göttingen was offered to him. Schlözer would have gladly accepted it, but his adversary contrived to induce the Russian government to refuse him permission to leave the country. After many negotiations he was however, in 1765, appointed professor of Russian history to the academy of St. Petersburg, and he also obtained leave of absence for three months to visit his native country. He returned to St. Petersburg, but only remained there two years longer, after which, in 1767, he was invited to the university of Göttingen, as professor of political science. Here he commenced a new and very active life, and wrote several historical works, some of which still rank among the best in the German language. His style is interesting, but sometimes rather coarse and without taste. His lectures on history, political science, statistics, and other subjects were heard with great admiration. At the age of seventy he withdrew from his office; in 1804 he was raised by the Emperor of Russia to the rank of a nobleman and received the title of privy councillor of justice. He died on the 9th of September, 1809. His Life has been written by his son, Christian von Schlözer, under the title of 'A. L. von Schlözer's Oeffentliches und Privatleben, aus Originalurkunden,' 2 vols. 8vo, Leipzig, 1828.

The works of Schlözer are partly historical and partly political. Among the former are, a 'General History of the North' ('Allgemeine Nordische Geschichte,' 2 vols. 8vo, Halle, 1772); a German translation of Nestor's 'Chronicle' down to the year 980, Göttingen, 1802-9; 'Weltgeschichte im Auszug und Zusammenhange,' 2 vols. 8vo, Göttingen, 1792-1802; 'Vorbereitung zur Weltgeschichte für Kinder,' a fifth edition of which appeared at Göttingen, 1800. As a political writer Schlözer had great influence in Germany. His views are laid down in his correspondence ('Briefwechsel') which he published at Göttingen in 10 vols. 8vo, 1779-82, and in a political journal called 'Staatsanzeigen,' which he edited from 1782 till 1793, in 18 vols. The main object of this last publication was to expose the evils and abuses in the administration of the various states of Germany.

SCHNEIDER, CONRAD VICTOR, was born at Bitterfeld in Saxony, in 1610, and died in 1680 at Würtemberg, where he had been for many years professor of medicine and physician to the elector. He appears to have been a very learned man, and to have possessed much skill and industry in forming compilations from the writings of other physicians. His works are very numerous: the most important is that entitled 'De Catarrhis' (Witteb., 1660), which consists of six books, devoted chiefly to an anatomical description of the cavities of the nose, and to the refutation of the ancient and generally received opinion that the mucus in a catarrh flows from the brain through apertures in the ethmoid bone into the nose and to the fauces. In this refutation it may be easily believed that he was successful; for the most superficial examination of the parts is sufficient to prove that such a passage of fluid is impossible, and that there are no holes in the skull which are not accurately closed by membranes, nerves, &c. In Schneider's time however the general reception of a different opinion must have rendered some intellectual energy necessary for the establishment of even so obvious a fact as this; and he has therefore been justly rewarded by the name of Schneiderian membrane having been since appropriated to that lining of the cavities of the nose of which he was the first to describe the structure and some of the functions.

SCHNEIDER, JOHANN GOTTLIEB, was born on the 18th of January, 1750, in the village of Kolm, near Wurzen, in Saxony, from which circumstance, in the title-page of all his works, he added to his name the epithet of 'Saxo.' His father was a poor village mason, and could do nothing for the education of his son. At the age of four years the boy was received into the house of an uncle, who was in better circumstances, and afterwards sent him to the public school of Schul-Pforte. Here he was subjected to a stricter discipline than he had been accustomed to, and his unwillingness to submit to it nearly brought upon him the disgrace of being sent away. The threat however roused his energies and ambition, and from this moment he began with the most unwearied diligence to study the ancient languages, which there formed the only subjects of instruction.

At the age of eighteen, his uncle sent him to the University of Leipzig to study law. But the acquaintance which he here formed with some of the most eminent philosophers, induced him to resume the study of ancient literature, which he had so successfully commenced at school. His first work, 'Anmerkungen über den Anacreon,' Leipzig, was published in 1770, and in the following year appeared the 'Periculum Criticum in Anthologiam Constantini Cephalæ.' To the latter work was added a series of emendations of the text of Aristotle's 'Natural History,' which from this time became his favourite study. In the same year Schneider left Leipzig for Göttingen; but as his uncle either would not or could not any longer supply him with money, he lived for several years in the greatest poverty, and gladly accepted the offer of Brunnck, to whom Heyne introduced him, and who wished to have the assistance of a young scholar for his edition of the Greek poets. Schneider accordingly went to Strasbourg, where he spent three happy years. The influence of the bold and sometimes rash criticism of Brunnck is manifest in many of Schneider's works, especially his earlier publications.

At Strasbourg, Schneider first began to pay attention to anatomy, botany, and zoology, which he did principally with a view to elucidate the ancient writers in these departments of knowledge. Here he also published a work on Pindar, 'Versuch über Pindars Leben und Schriften,' 8vo, 1774; and Plutarch, 'De Puerorum Educatione,' acced. bina ejusd. et Marcelli Sidetæ Fragmenta,' 8vo, 1775. Conjointly with Brunnck he made an edition of Oppian's Poems, 8vo, 1776; and a collection of the fragments of Pindar, 4to, 1776. In the same year Schneider was invited to the professorship of philology and eloquence in the University of Frankfurt-on-the-Oder. He considered the lectures in the university to be of much less importance than they were generally supposed to be, and accordingly he not only encouraged his pupils to private study, but himself set a most active example. His principal attention however was directed to natural history, and those ancient works on this subject which were totally neglected by scholars; and he not only availed himself of everything that was within his reach, but undertook journeys to most of the great towns of Germany, where he thought he might collect information from the public and private collections of natural objects. The first work that he published at Frankfurt was an essay, 'De dubia Carminum Orphicorum Auctoritate et Vetustate.' In 1811 the University of Frankfurt was transferred to Breslau. Schneider followed the university, and continued to hold the same office. In 1816, on the death of Bredow, who was chief librarian to the university, Schneider gave up his professorship and became Bredow's successor, a post much more suited to his taste. In this office he continued until his death, January 13, 1822.

Schneider was a man of simple habits often bordering on coarseness, which was probably the consequence of his residence with his uncle, who had no time to attend to his education, and left the boy to the influence of his rough companions; but he was free from pride or pretension, and took a delight in assisting young men in their studies. As a philologist he ranks in some respects among the first of modern times, and in the department to which he principally devoted his attention he stands almost alone. The criticisms of his maturer age are much more sober and sound than those of his earlier years, though in his German works on natural history he often shows much more learning than judgment and good sense.

The works which he published after he settled at Frankfurt-on-the-Oder may be divided into two classes: 1, those of a philological and critical character, most of which relate to the subject of natural history as known to the ancients; and, 2, works on natural history, both ancient and modern. The works of this latter class are for the most part written in German. Among the former we shall mention his editions of Demetrius Phalereus, 'De Elocutione Liber,' 8vo, Altenburg, 1779; 'Alian, 'De Natur. Animal.' Græc. et Lat., 2 vols. 8vo, Leipzig, 1784. In 1790 he undertook the revision of the works of Xenophon, edited by Zeune, and added himself a new and critical edition of the other works of Xenophon with valuable notes. The whole collection of Xenophon's works edited by Schneider consists of 6 vols. in 8vo, and the last edition of them appeared in 1815-25 at Leipzig. Nicander, 'Al-xipharmaca, seu de Venenis, &c., Carmen, cum Vers. Lat., Schol. Græc., &c., 8vo, Halle, 1792; Nicander, 'Theriaca,' 8vo, Leipzig, 1816; 'Scriptores Rei Rusticæ, cum comment. illustr. et fig., 4 vols. 8vo, Leipzig, 1794-97; 'Aristotelis De Animalibus Historiæ Libri X., Græc. et Lat., cum comment. et indice,' 4 vols. 8vo, Leipzig, 1812. In 1797 he published the first edition of his 'Greek Dictionary,' the best that had appeared since the days of Henry Stephens. A second edition appeared in 1805, and a third in 1820, 2 vols. 4to; and in the following year he published a supplement to it. He also edited 'Theophrasti Characteres, cum viror. doct. conject. correcti,' 8vo, Jena, 1799; 'Eclogæ Physicæ,' 2 vols. 8vo, 1801, comprising the most important parts of natural history known to the ancients, with very valuable notes. 'Argonautica Orpheæ,' Jena, 1803; Vitruvius, 3 vols. 8vo, Leipzig, 1807; 'Aristotelis Politica,' with a Latin translation, 2 vols. 8vo, Frankfurt-on-the-Oder, 1809; 'Æsop's 'Fables,' 8vo, Breslau, 1812; 'Epicuri Physica et Meteorologica,' 8vo, Leipzig, 1813; 'Oppianus, Cynegetica et Halieutica,' with a Latin translation, 8vo, Leipzig, 1813. In this edition he has withdrawn many of the bold corrections of his former edition. 'Anonymi (Economicæ, quæ vulgo Aristotelis falso ferebantur,' 8vo, Leipzig, 1815; 'Theophrasti Opera omnia,' 5 vols.

8vo, Leipzig, 1818-21, to which in 1822 a sixth volume was added. His German works on natural history, and his short essays on various subjects, are extremely numerous: a complete list of them is given in Meusel's 'Gelehrtes Deutschland.'

SCHNORR VON KARLSFELD, JULIUS, was born at Leipzig on the 26th of March, 1794. His father, Hans Schnorr von Karlsfeld (born 1764, died 1840), a painter of some celebrity in his day, was director of the Art-Academy at Leipzig, and Julius received his earliest instruction in art from him, though he was desirous that his son should adopt a different profession. But the boy displayed at an unusually early age such remarkable talent for art, and so earnest a desire to follow it, that the elder Schnorr was induced to yield, and at the age of sixteen Julius was entered a student in the Academy of Painting, at Vienna. There he distinguished himself, though the formal conventionalisms inculcated were anything but favourable to the development of original genius. Happily in good time he proceeded to Rome (1815) where he at once attached himself to the society forming under the auspices of Cornelius and Overbeck, and when that remarkable cluster of young German painters brought their productions fairly before the artistic world, Julius Schnorr was recognised as one of the most accomplished of the promising band. His work the 'Wedding in Cana,' attracted so much notice that he was chosen along with Cornelius and Overbeck to paint the walls of the villa Massimi at Rome, in the revived art of fresco, with designs from the trio of great Italian poets Dante, Ariosto, and Tasso. To Schnorr was assigned Ariosto, and his designs were received with general approbation. He also produced while at Rome 'Jacob and Rachel,' 'Madonna and Child,' 'Ruth in the field of Boaz,' 'Flight into Egypt,' and other important works.

At Rome Schnorr had gained the friendship of Niebuhr, Humboldt, and Bunsen, by whom he was introduced to the munificent patron of artists, Ludwig, crown-prince and afterwards king of Bavaria. When Ludwig set about the construction of his magnificent works at Munich, Julius Schnorr was one of the artists he summoned to assist in decorating them. He removed to Munich in 1825, and in 1827 was appointed professor of historical painting in the Academy of the Fine Arts there. His first great commission was to paint the state apartments of the new palace, with a series of frescoes from the ancient national poem of the Nibelungen-lied. After these had proceeded some way however, they were suspended in order to complete the decoration of that portion of the palace called the Fest-Saalbau, three grand saloons of which were given to Schnorr to adorn with paintings of large dimensions representing leading events in the history of Charlemagne, Frederic Barbarossa, and Rudolf of Hapsburg, the three rooms being severally named after those personages. These three series of paintings occupied Schnorr above ten years. He made all the designs, prepared the working cartoons, and executed several of the more important paintings, but the greater number were painted under his supervision by his pupils. They are painted in encaustic, and have a grand appearance. In some may be discovered much superfluous energy and occasional exaggeration, in others simplicity carried to excess, in many a great redundancy of drapery, and exceptions may, perhaps justly, be taken to much of the colouring; but after every drawback is allowed, it must be confessed that they display abundant and vigorous imaginative power, immense technical skill, and that they produce a very impressive effect.

On the completion of his historical, Schnorr returned to his mythic series. Having destroyed such of the frescoes already done as did not satisfy his more mature judgment, he set himself with characteristic diligence to his great task. As completed the Nibelungen series occupies five chambers, each named from the section of the Lied which is depicted in it. The first called the 'Entrance Hall,' contains the personages of the poem. The second or 'Marriage Hall' is devoted to the leading events in the life of Siegfried. The third, the 'Hall of Treachery,' contains the story of Hagen's treachery, from the moment when Kriemhild informs Hagen of the secret of Siegfried's vulnerability, to its consummation in Siegfried's murder. The fourth, the 'Hall of Revenge,' carries the story on to the death of Hagen by the hand of Kriemhild, and her own death by the sword of Hildebrand. The fifth is the 'Hall of Lamentation.' These paintings, which are in fresco, were likewise all designed by Schnorr and painted by himself and his pupils. They have all the artistic excellences of the historic series just noticed, and are painted with a broader and more genial feeling. Of all the many great modern paintings in Munich these are perhaps the most generally popular, both among the artist's countrymen, and with strangers.

Schnorr continued to reside in Munich till he had completed his great works in fresco and encaustic, busy also during the whole time on other paintings, and designs for engravings, of various degrees of importance, but sufficient alone to have secured him a foremost place among modern painters. In 1846 he accepted an invitation to become director of the Picture Gallery, and professor in the Academy of the Fine Arts at Dresden, where he remained pursuing a course of persevering diligence till his death, which occurred on the 18th of April 1853.

Several of the works of Julius Schnorr have been engraved. In England he is perhaps best known by his extensive series of Bible pictures 'Die Bibel in Bildern,' Leipzig, 4to, 1852, &c. These have

been reprinted in London from the original wood-blocks, and though more suited to the taste of Germans than ordinary English Bible-readers have met with a large sale. They exhibit wonderful animation, variety, and power, though like most of Schnorr's works most successful in passages admitting of somewhat exaggerated expression and action. Schnorr has also made the designs for an illustrated edition of the Nibelungen published in 1843, but he is seen to a disadvantage in designs of so small a size. An elder brother LUDWIG SCHNORR, born in 1789, also acquired considerable notice in early life by a large altar-piece of St. Cecilia, a Faust, and some other pictures, but he scarcely maintained the position his early success promised. He settled at Vienna where he painted many portraits, as well as various historical and genre pictures.

SCHNURRER, CHRISTIAN FRIEDRICH, was born October 28, 1742, at Canstadt in Württemberg. He studied at Tübingen, where, in 1762, he began his career as an academical teacher. Four years later he went to Göttingen, and afterwards made a journey through Holland, England, and France. On his return, in 1770, he was appointed professor of philosophy at Tübingen, where he subsequently lectured on the Greek and Oriental languages. For some time he was ephorus of the theological faculty, and in 1805 he was appointed chancellor of the university. After the French were driven from Germany, Schnurrer became a member of the Chamber of Deputies in Württemberg, and although his official position prevented him from joining either party, he was always an advocate of liberal principles, and was from the first opposed to the design of the government to restore the constitution of Württemberg as it had been previous to the year 1806. In 1817 the king of Württemberg, in accordance with the promise made at the Congress of Vienna, gave a new constitution to his kingdom, and on this occasion Schnurrer declared that he would willingly vote for its acceptance, provided the king would introduce it in the form of a contract between himself and his subjects. In consequence of this boldness Schnurrer was deprived of his office, though two years afterwards the government was obliged to adopt the plan proposed by him. After his dismissal Schnurrer sold that part of his extensive library which consisted of Arabic literature, and which he had chiefly collected during his stay in England, to Mr. Knatchbull. Schnurrer died on the 10th of November 1822.

Schnurrer was a man of great and accurate learning, especially in Oriental literature, but his official duties prevented him from producing many great works. His writings, though numerous, are mostly small dissertations on historical and theological subjects, written on various occasions and in programs. From the year 1793 he took an active part in a literary journal called 'Tübinger Literarische Nachrichten.' His 'Bibliotheca Arabica,' the last edition of which appeared at Halle, 1811, is a work of great learning and diligence. His 'Orationum Academicarum Delectus Posthumus,' was edited by Paulus, Tübingen, 1828. The Life of Schnurrer has been written by Weber, under the title of 'C. F. Schnurrers Leben, Charakter, und Verdienste,' Canstadt, 1823.

SCHÖFFER, PETER, though commonly called one of the inventors of printing, appears to have been rather one of its first material improvers. He was born at Gernsheim in Hesse-Darmstadt, and is said in early life to have worked as a copyist in Paris. Soon after the commencement of the partnership between Gutenberg and Fust, Schöffer appears to have repaired to Mainz, and to have been employed by them. In the account given by Trithemius [GUTENBERG], he is stated to have "discovered the more easy method of casting the types." Gutenberg however must have cast types, and Schöffer's improvement was that of cutting punches, by which greater symmetry in the type was attained, and a correct reproduction of the matrices secured. The extent of Schöffer's share in the discovery or improvement of printing has been discussed in Dahl's 'P. Schöffer von Gernsheim, Miterfinder der Buchdruckerkunst,' 1814, followed in 1832 by 'Die Buchdruckerkunst, erfunden von Johann Gutenberg, verbessert und zur Vollkommenheit gebracht durch Peter Schöffer von Gernsheim;' and in 'P. H. Kuelb's 'Peter Schöffer, der Vollender der Buchdruckerkunst,' published in 1836. After Fust and Gutenberg had separated in 1455, Schöffer became a partner with Fust, whose daughter he married. His name appears with Fust's at the end of the Psalter of 1457, and they continued to print jointly till Fust's death in 1466. The list of their books has been already given in a former volume. [FUST.]

The list of books printed by Schöffer alone after Fust's death is a long one. It will be found in Panzer's 'Annals,' vol. ii., 4to, Norimb., 1794, p. 117-136, with an enumeration of other works supposed to be his by the type, but without his name. Among those certainly known as his, are, the 'Secunda Secundæ' of St. Thomas Aquinas; and the second edition of the 'Constitutions of Clement V.,' 1467; the 'Institutions of Justinian,' 1468; St. Thomas Aquinas's 'Commentary on Peter Lombard,' fol., 1469; the second edition of the 'Sixth Book of the Decretals of Pope Boniface VIII.,' 'Biblia Latina,' 2 vols. fol., 1472; and 'Herbarium, cum Herbarum Figuris,' 4to, 1484. His last work of all was a Latin Psalter, fol., 1502; in which year he is supposed to have died. He had three sons, all printers, of whom the eldest, John Schöffer, succeeded him in his business; his name appears alone as the printer of 'Mercurius Trismegistus,' in 1503, and of many subsequent works, and he is known to have practised his art as late as 1533.

We may notice here that the account of the donation by Gutenberg of certain books to the convent of St. Clare, stated to be contained in a deed in possession of the University of Mainz, is now known to have been a forgery.

SCHOLEFIELD, REV. JAMES, M.A., was born November 15, 1789, at Henley-on-Thames, Oxfordshire. His father, Nathaniel Scholefield, was minister of the Independent Dissenters' chapel, in that town. He was educated in the school of Christ's Hospital, London, became a Grecian there, and obtained several prizes. He was entered of Trinity College, Cambridge, in 1809. Having been elected Scholar in 1812, he in that year obtained the Craven University Scholarship. He took holy orders in October 1813, by special permission, before he had taken his degree of B.A. Soon afterwards, on proceeding to his degree, he attained the place of Senior Chancellor's Medallist, and was first in the list of Senior Optimes. About the same time he became curate to Mr. Simeon, of Trinity Church, Cambridge. In October 1815, he was elected a Fellow of Trinity College. Having taken his degree of M.A., he obtained in July 1823, by presentation of his college, the perpetual curacy of St. Michael's, Cambridge, where for thirty years he performed the duties of his sacred office with unwearied zeal and assiduity. On the death of Mr. Dobree, he was elected, October 22, 1825, Regius Professor of Greek in the University of Cambridge. In 1827 he married, and in the same year he commenced the courses of lectures on the principal Greek authors, which, with few interruptions, he continued for a quarter of a century. In the Lent Term of each year he delivered lectures on Æschylus, Plato, Aristophanes, Thucydides, Sophocles, Demosthenes, and Pindar, returning to each, on an average, once in seven years. In 1844 he made a tour in Scotland, and he visited that country three times afterwards. On the 11th of November 1849 the church of St. Michael was burnt down. On the following day Dr. French, canon of Ely, died, and Mr. Scholefield succeeded him in the canonry, the preferment being attached to the Regius Professorship of Greek. St. Michael's church was rebuilt, and was re-opened January 11, 1852. Professor Scholefield's health however had been failing for some time, and he was ordered by his medical adviser to refrain from preaching, and take rest in some healthful and pleasant place. For that purpose he retired to Hastings, on the coast of Sussex, and there died, April 4, 1853. He was buried at Fairlight, near Hastings.

Professor Scholefield's principal literary publications are as follows. In 1826 he published a new edition of Porson's Four Tragedies of Euripides; in 1828 an edition of Middleton's 'Treatise on the Greek Article;' an edition of Æschylus, with notes critical and explanatory; and a new edition of Bishop Leighton's 'Pælectiones.' His next work was 'Petri Pauli Dobree Adversaria,' containing Dobree's notes on the Greek historians, philosophers, and minor orators, of which Part I. was published January 1831; Part II. November 1831; and Part III. January 1833. In 1832 he published 'Hints for an Improved Translation of the New Testament,' and in 1834 an edition of the New Testament, in which the original Greek and authorised English version are printed in parallel columns. In 1843 he published an edition of the 'Eumenides' of Æschylus. Several of his sermons have been published in a separate form.

(*Memoirs of the Rev. James Scholefield, M.A., late of Trinity College, Regius Professor of Greek in the University of Cambridge, Perpetual Curate of St. Michael's, and Canon of Ely, by his Widow, with Notes on his Literary Character by the Rev. William Selwyn, M.A., Canon of Ely, 8vo, 1855.*)

SCHOLZ, JOHANN MATTHIAS AUGUST, was born at Kapsdorf near Breslau in Prussian Silesia on February 3, 1794. He received his early education in the Roman Catholic gymnasium of Breslau, in 1812 entered the university there where he studied theology and philology; and in 1814 gained a prize in the Roman Catholic theological faculty for his essay on the Parable of the Vineyard. Shortly afterwards he commenced his critical labours on the text of the New Testament, and with this object after he had for two years availed himself of the materials in the library of Vienna, in 1817-19 he visited Paris and London, Switzerland and Italy. In 1820, immediately after being appointed professor extraordinary of theology at Bonn, he joined the expedition under Minutoli for the exploration of Egypt and the neighbouring countries. The travellers disagreed and parted, but Scholz journeyed through Egypt, Palestine, and Syria for four months, when he returned to Trieste. At Breslau in 1821 he took priest's orders, exercised his functions at Bonn, and in 1823 was made professor of theology in the university and a canon of the cathedral. He died in November 1852. Among his principal works we may mention 'Reise in die Gegend zwischen Alexandrien und Paratonium, die libysche Wüste, Siwa, Ägypten, Palästina, und Syrien, in den Jahren 1820 und 1821,' which was a selection from his diary, and was published in 1822. In 1825 he issued at Bonn his 'Commentatio de Golphathæ et Jesu Christi Sepulcri situ,' in 1834 his 'Handbuch der biblischen Archäologie,' and in 1830 and 1835 the great object of his studies, the text of the New Testament, under the title of 'Novum Testamentum Græce,' in two volumes. Scholz's excellence as a philologist has been generally acknowledged, and his labours are held in high estimation.

SCHOMBERG, ARMAND FREDERIC DE, was of German family, but born of an English mother, of the house of Dudley, in

or about 1619. Bred a soldier, he began his career in the Swedish army, during the Thirty Years' war, and was punished by the emperor for the part which he took by confiscation of his property. He then entered the service of the Netherlands, and afterwards that of France, in which, from 1650 to 1685, he led an active and distinguished life, and rose to the rank of marshal. In 1685, the revocation of the edict of Nantes drove him, with many other of the best and most useful subjects of France, to seek liberty of conscience in another country; and he betook himself first to the service of Portugal, then to that of the Elector of Brandenburg, and lastly to that of the Prince of Orange, when about to make his descent upon England in 1688. In our own country the course of events gave little opportunity for the exercise of military talent. Schomburgk was sent to Ireland in 1689, as commander-in-chief; where, during ten months, his successes fell short of the expectation raised by his high reputation. Age perhaps had made him over-cautious. He was killed July 1, 1690, by a pistol-shot, at the battle of the Boyne, while gallantly leading a regiment of French Protestants across the river.

\*SCHOMBURGK, ROBERT HERMANN, KNIGHT, son of the Rev. John Frederick Lewis Schomburgk, a German Protestant minister in Thuringia, was born in 1804. From his early years he has been devoted to geographical science and to the study of natural history. In 1831 he was sent out to the West Indies to survey the island of Anegada, one of the Virgin Islands, surrounded by coral reefs, on which many shipwrecks had occurred. In 1835 he undertook a mission from the Royal Geographical Society of London to explore the interior of Guiana. His researches were carried on in the face of difficulties of a very formidable character, but he succeeded in tracing the more important rivers and in exploring the interior of the country, so as to be able to describe in a far more satisfactory manner than had been hitherto done the physical features, geology, and natural history of Guiana; much indeed being for the first time made known to the scientific world. It was during this exploratory journey that Mr. Schomburgk in making his way up the Berbice River discovered, January 1, 1837, the Victoria Regia water lily, the most magnificent aquatic plant known to exist: he communicated an account of his discovery to the London Botanical Society, where it was read September 7, 1837. The plant itself we need hardly say has been made a denizen of the great public and private conservatories of this country. Full accounts of his journeys in Guiana were communicated during their progress to the Royal Geographical Society, and published in the 'Journal' of that society, and much of their substance was afterwards embodied in his work on British Guiana. On his return to England in 1839 Mr. Schomburgk received the gold medal of the Royal Geographical Society for his 'Travels and Researches during the years 1835-39 in the Colony of British Guiana, and in the adjacent parts of South America.' In the following year, 1840, he was sent by the British government to make a survey of British Guiana. Having successfully accomplished this object he was knighted on his return. He published shortly after a very valuable account of the country under the title of 'A Description of British Guiana.' He also published a series of 'Views in the Interior of Guiana.' In 1847 Sir R. H. Schomburgk published a very elaborate 'History of Barbadoes,' a work of great research and value. In 1848 he was appointed British consul to the republic of St. Domingo, which post he still occupies.

Sir Robert has continued to pursue in San Domingo his scientific labours, and the results have been at intervals communicated to the Geographical and other societies. One of his very valuable papers deserves to be specially mentioned, an account of his investigation of the physical geography, &c., of the 'Peninsula and Bay of Samaná in the Dominican Republic,' which he communicated to the foreign office, and which was printed in the 'Journal of the Royal Geographical Society,' vol. xxiii., 1853. Sir R. H. Schomburgk enjoys a European reputation, as is evinced by the honours he has received from various courts and learned societies: he was nominated a knight of the Prussian order of the Red Eagle in 1840; of the Saxon order of Merit in 1845; and a Chevalier of the Legion of Honour in 1847; he was created Doctor of Philosophy by the University of Königsberg, and he has been elected an honorary member of several of the learned societies of Europe and America.

SCHÖN or SCHONGAUER, MARTIN, one of the most celebrated of the early German painters and engravers, was, according to recent discoveries, born at Ulm of a family which produced many artists in the early part of the 15th century; his name occurs in Ulm documents from 1441 to 1461. The inscription therefore upon the back of his portrait in the gallery at Munich, though probably authentic, is apparently erroneous. He settled about 1461 at Colmar, and died there in 1486 (Sandrart, Nagler).

Martin appears to have been chiefly an engraver in his youth, and to have devoted his attention principally to painting after a visit to the Netherlands, where he became acquainted with the excellent works of the Van Eycks and their scholars. He probably resided some time at Antwerp, as he was sometimes called by the Italians Martino d'Anversa; and from a letter of Lambertus Lombardus to Vasari dated April 27, 1565, and published by Gaye in his *Carteggio Inedito d'Artisti*, iii. 177, it is supposed that he studied under Roger van Bruges, now from good evidence considered to be the painter

of the portable altar of Charles V., which has been hitherto attributed to Memling.

The best works of Martin Schön are still at Colmar in the college library, but there are many which are attributed to him in the collections of Munich, Vienna, Nürnberg, and Schleissheim, and in other places, as Ulm, Stuttgart, Basel, Berlin, &c. His pictures are in all respects similar to those of other pupils of the Van Eyck school, but are inferior in colour to those of his master Roger van Bruges; they are notwithstanding among the best works of their style. Many of the pictures of an inferior painter, Martin Schaffner, have been and still are ascribed to Martin Schön. None of his pictures are signed with either a name or a monogram, but his prints are generally marked with a monogram.

Schön's prints, though crude in light and shade, are among the best of the early productions of the Germans in this class. Bartsch enumerates and describes 116. Seventeen others bear his monogram, but are supposed not to be by him; and twelve very doubtful prints are enumerated by Heineken: the list is reprinted in Nagler's 'Künstler Lexicon.' Schön, which in German signifies excellent and beautiful, is supposed to be a nickname of this artist, whose real name was Schongauer; he was formerly called Hübsch Martin by the Germans, and Bel Martino and Buon Martino by the Italians. There was an earlier painter and wood engraver of the name of Martin Schoen at Ulm, who was active from 1394 until 1416. Some of his works still exist, but they are in a ruinous condition.

(Sandrart, *Deutsche Academie*, &c.; Bartsch, *Peintre Graveur*; Grüneisen, *Ums Kuntstleben im Mittelalter*; Von Quandt, *Kunstabblatt*, 1840; Waagen, *Kunstwerke und Künstler in Deutschland*, vol. iii.; Nagler, *Neues Allgemeines Künstler Lexicon*.)

\*SCHÖNLEIN, JOHANN LUK, a distinguished German physician. He was born at Bamberg on the 30th of November 1793, and received his early education in the gymnasium of that place. He afterwards studied in the universities of Landshut and Würzburg, in the latter of which he took his degree of Doctor of Medicine in the year 1816. He afterwards studied at Göttingen and Jena, but returned to Würzburg in 1819. The following year he was made Professor of Clinical Medicine in the Julius Hospital. Here he distinguished himself for his industry in the observation of disease. In 1833 he accepted the professorship of Clinical Medicine at Zurich. In 1840 he commenced delivering lectures in Berlin, and in the course of a short time attracted great attention on account of the wide and accurate knowledge of the nature of disease which he displayed. He was appointed Professor of Pathology in the university, and also professor at the Medical and Surgical Military Academy of Berlin. He is chiefly known out of Germany by the clinical reports of his lectures and cases published by his pupils. He has published nothing himself. Those however who are anxious to discover his opinions will find them in a work entitled 'General and Special Pathology, and Therapeutics,' published at Würzburg, in four volumes, in 1832.

\*SCHOOLCRAFT, HENRY ROWE, celebrated on account of his travels among the native Indians of North America, and his researches into their language and antiquities, was born on the 28th of March 1793, at Hamilton in Albany, New York, where his father, Colonel Lawrence Schoolcraft, was the manager of extensive glass-works. Having while a mere child displayed a remarkable talent for drawing and painting, negotiations were entered into for his apprenticeship to a portrait-painter, but his destination is said to have been changed to that of a house-painter, though it does not appear that he was actually apprenticed; and we find him at a sufficiently early age engaged in the study of literature and science. At the age of fourteen he was a contributor of both prose and verse to the newspapers, and he was, we are told, already occupied in the study of the philosophy of languages. At the age of fifteen he entered Union College, where he completed his scholastic education. Hebrew, German, and French he is said to have taught himself during the intervals of collegiate study and newspaper writing, and he at the same time was assiduously engaged in the study of mineralogy. In 1816 he commenced the publication of a work on the manufacture of glass, enamel, &c., and the application of chemistry to these arts, under the title of 'Vitrology,' but not meeting with a sufficient sale it was discontinued.

He began in 1817 the course of travel and inquiry to which he owes his reputation, by a journey, prosecuted through that and part of the following year, down the Alleghany river to the Ohio, thence up the Missouri to St. Louis, exploring the whole of the Missouri shore on foot, as well as the district around Potosi, and thence to the Ozark and highland regions extending to the foot of the Rocky Mountains, and the wilder parts of Arkansas. His object in this journey was to make a geological exploration of the country and to form a mineralogical collection; and having arranged his notes and specimens he proceeded to Washington, in the hope of inducing the government to undertake the working of the lead mines of Missouri. He met with a warm reception from the scientific men of the capital, his collections being the first of the kind made, with any approach to completeness, in America. In like manner his account of the 'Mines and Mineral Resources of Missouri' (8vo, 1819), was recognised as the first detailed description of a North American mining district which had then been published. The success of this work led to his appointment by Calhoun as geologist to the exploring expedition under

General Cass, despatched by the government in the spring of 1820, to the sources of the Mississippi. Of this expedition he published on his return in 1821, his 'Journal,' and also his geological report. These works added much to his reputation, and of the 'Journal' a large edition was sold in a few weeks. Having been appointed secretary to an Indian conference at Chicago, he made in 1821 a lengthened journey along the Miami and Wabash rivers, and into Illinois, of which he published an account under the title of 'Travels in the Central Portions of the Mississippi Valley.'

In 1822 he was appointed by President Monroe agent for Indian affairs in the North Western Provinces, his residence being fixed at the foot of Lake Superior. Here he became acquainted with and married Miss Jane Johnston, the eldest daughter of an Irish gentleman who had settled in those parts, and married the daughter of Wa-bo-jeeg, a celebrated war sachem and hereditary ruling cacique. Miss Johnston, who had been sent to Europe to be educated, was a young lady of accomplishments and literary tastes, but she had derived from her mother an intimate acquaintance with the Indian language and traditions for which she retained a warm attachment. His marriage with her stimulated his interest in Indian matters and smoothed his way for the acquisition of all kinds of information; and during a continuous residence of twenty years in the vicinity of Indian tribes at Elmwood and Michilimackinack he pursued with untiring ardour the investigation of the Indian languages, ethnology, and antiquities, abandoning for them, to a great extent the geological studies which had won him his early reputation. But during all this time he was constantly engaged in his official and extra-official duties. He attended several important conferences of Indian tribes, and in 1831 was sent on two or three occasions, accompanied by United States troops, to advise or compel hostile tribes to arrange their differences. From 1828 to 1832 he was a member of the territorial legislature, and in that capacity he procured the passing of several laws tending to benefit the Indian races; he also induced the legislature to adopt a system of county and township names formed by him on the basis of the aboriginal vocabulary. During this time he managed the finances of the territory; and he founded in 1823 the Michigan Historical Society, and the Algic Society of Detroit for the investigation of the Indian language and antiquities.

In 1832 Mr. Schoolcraft was directed to conduct an expedition to the Upper Mississippi, north and west of St. Anthony's Falls. Of this journey he published an account with maps, under the title of 'An Expedition to Itasca Lake,' New York, 1834. Mr. Schoolcraft 'succeeded in tracing the Mississippi up to its ultimate forks, and to its actual source in Itasca Lake, which point he reached on the 23rd of July, 1832.' According to the writer of 'Sketches of the Life of H. R. Schoolcraft,' prefixed to his 'Thirty Years with the Indian Tribes,' he is "the only man in America who has seen the Mississippi from its source in Itasca Lake to its mouth in the Gulf of Mexico."

In 1836 President Jackson appointed Mr. Schoolcraft commissioner to treat with the Indian tribes of the north-west for the purchase of their lands, and he succeeded in obtaining from them a tract of some 16,000,000 acres in the region of the Upper Lakes. On the completion of this negotiation he was appointed acting superintendent of Indian affairs for the northern department, and in 1839 chief disbursing agent for the same department.

One of his earliest undertakings in connection with his Indian studies was the construction of a complete lexicon of the Algonquin language—or the primitive and most widely-diffused of the aboriginal languages; and he reduced the grammar of this language to a system. He read before the Algic Society a course of lectures on the Algonquin language, and two of them being translated into French by M. Duponceau, obtained for him the gold medal of the National Institute of France. In 1839 appeared his 'Algic Researches, comprising Inquiries respecting the Mental Characteristics of the North American Indians: First Series, Indian Tales and Legends,' 2 vols. 12mo, New York, 1839: a valuable body of legends collected by him from the Indian wigwags, or obtained by his wife from her family stores. No book had given so faithful an image of the domestic life and habits of thought of the aboriginal Americans; and if we have since been able to penetrate even further into their inner life, it has been chiefly by means of Mr. Schoolcraft's subsequent publications.

He now resolved to remove to New York, and digest the immense mass of materials he had so laboriously collected. Arriving in that city in 1841, he issued proposals—with a specimen number—of an 'Indian Cyclopædia,' which was intended to embrace the history, ethnology, and philology of the tribes, and the geography and antiquities of the country occupied by them; but he could find no publisher willing to undertake the risk of a work of such magnitude, and the scheme fell to the ground. He then resolved to undertake a tour in Europe, partly in order to make himself better acquainted with the recent progress in archaeological and philological studies. His works had already rendered his name familiar in Europe, and he received a warm welcome both in this country and on the Continent; but during his absence he lost his wife, the companion of his Indian studies. On his return to America he made an antiquarian tour in Western Virginia, Ohio, and the Canadas; and he communicated the result of his examinations of the great Indian mounds which he saw in this journey to the Geographical Society of Denmark, which had elected

him an honorary member. In 1844 he published in numbers the first volume of a miscellany entitled 'Oneota, or the Indian in his Wigwam,' in which he gave popular sketches of the history, customs, poetry, traditions, &c., of the Indians, with descriptions of their country, in extracts from his journals, besides much other miscellaneous information respecting them. About the same time appeared a collection of his poetry, under the title of 'Alhalla, or the Lord of Talledaga, a Tale of the Creek War, and some Miscellaneous Pieces,' some of them previously printed. He also printed an 'Address' delivered before the Ethnological Society of New York, of which he was one of the founders; a paper on the 'Grave Creek Mound in Western Virginia' (in the 'Transactions' of the American Ethnological Society); an 'Address' delivered before the New York Historical Society; and some other papers.

In 1845 the legislature of the state of New-York empowered Mr. Schoolcraft to take a census and collect statistics of the Iroquois or Six Nations, and the results were published in the following year under the title of 'Notes on the Iroquois, or Contributions to the Statistics, Aboriginal History, Antiquities, and General Ethnology of Western New-York.' This work, which gave a much more favourable view than was commonly held of the condition and prospects of the tribes, was a good deal canvassed, but was received with very general approbation. In 1846 Mr. Schoolcraft succeeded in bringing the Aborigines question under the notice of Congress, and by a large body of various information enforcing his opinion that their character had been misunderstood and a wrong policy adopted towards them; and he strongly urged the importance of the executive making a strenuous effort to collect such historical and other information as might still be preserved among them, as well as full information respecting their actual condition. In consequence of his representations the Congress passed an act, authorising the appropriation of the necessary funds for the purpose and directing the secretary of war "to collect the statistics of all the tribes within the Union, together with materials to illustrate their history, condition, and prospects." The enquiry was entrusted to Mr. Schoolcraft, who issued an elaborate series of questions, "embodying the results of his thirty years' studies," and carried out the investigation with a rare amount of zeal and energy. The first part of his report appeared in 1850 in the shape of a bulky quarto volume, entitled 'Historical and Statistical Information respecting the History, Condition, and Prospects of the Indian Tribes of the United States, collected and prepared under the direction of the Bureau of Indian Affairs, per Act of Congress of March 3rd, 1847, by H. R. S., illustrated by S. Eastman, Capt. U. S. army: published by Authority of Congress; and three more parts or volumes have since appeared. This great work, in its way unique, must always remain a standard authority on the interesting subject of which it treats; and with Mr. Schoolcraft's more popular works it comprises that complete 'Indian Cyclopædia' which in his earlier days it was his ambition to produce.

During the progress of this his great work—to carry on which effectually he had removed with his second wife to Washington—he commenced the publication of 'a revised series of his complete works,' by the publication, in one 8vo volume, Phil. 1851, of his 'Personal Memoirs of a Residence of Thirty years with the Indian Tribes on the American Frontiers, 1812-1842,' a work answering pretty closely to its title, and consequently neither systematic nor profound, and, despite of many remarkable personal adventures, in its disconnection not very entertaining, but full of materials serviceable to those interested in Indian manners, language, and history: prefixed to it is a somewhat too magniloquent life of the author, from which the materials of this sketch are (with the assistance of Mr. Schoolcraft's writings) mainly derived. Mr. Schoolcraft has since published 'American Indians, their History, Condition, and Prospects, from Original Notes and Manuscripts,' 1 vol. 8vo; 'Scenes and Adventures in the Semi-Alpine Region of the Ozark Mountains of Missouri and Arkansas,' 8vo, 1853; and 'The Myth of Hiawatha and other Oral Legends, Mythological, and Allegoric, of the North American Indians,' 8vo, Phil., 1856. The last work was published in consequence of the popularity of Longfellow's celebrated poem of Hiawatha. In the Notes to that poem, Mr. Longfellow mentions Mr. Schoolcraft's writings as the source whence he derived his legend, and Mr. Schoolcraft was induced by this notice to revise and recast his 'Algic Researches,' which had long been out of print, and give the Indian stories in their original simplicity.

Besides being a member of the chief American literary and scientific societies Mr. Schoolcraft is an associate or member of the Geographical Society of London, the Ethnological Society of Paris, and the Society of Northern Antiquaries, Copenhagen. In 1846 the University of Geneva conferred upon him the degree of LL.D.

SCHOOTEN, FRANCIS, a Dutch mathematician of the 17th century, of whose life scarcely any particulars have been preserved. He was professor of mathematics at Leyden, and was one of the young philosophers, chiefly natives of Holland, who, rising superior to the prejudices of the age in favour of the ancient geometry, contributed most to the establishment and promotion of what was then called the New analysis—the algebra of Descartes and the infinitesimal calculus.

In 1646 he published a small tract on conic sections, in which are given several ways of describing those curves by a continuous motion; and in 1649 he gave to the world a Latin translation, accompanied by

a learned commentary, of the geometry of Descartes. Ten years afterwards he published, with numerous additions, a second edition of the commentary in two volumes. This work has met with general approbation, as it presents a clear explanation of the subject without the prolixity which usually accompanies the writings of a commentator; it is also enriched with the researches of several distinguished mathematicians of the age. It contains two letters from Hudde (burgomaster of Amsterdam) on the reduction of equations, on the method of tangents, and on propositions concerning maxima and minima; and one from Van Heuraet on the rectification of curves. There are also two tracts by M. Beane on the limits of equations, and one entitled 'Elementa Curvarum,' by the unfortunate minister De Witt.

In 1651 he published his 'Principia Matheseos,' and in 1657 his 'Exercitationes Mathematicæ.' The latter work, which is now scarce, contains, besides the solutions of several curious and intricate propositions, many useful and instructive applications of algebra to geometry, particularly a restoration, in part and in an algebraic form, of the treatise on 'Plane Loci,' from the works of Apollonius.

The year of Schooten's birth is not known, but he died in 1659, while the second volume of the commentary above mentioned was in the press.

SCHOREL, or SCHOREEL, JOHN, was born in 1495, at Schorel, a village near Alkmaar in Holland. His parents dying when he was very young, he was put to school by some near relations; and as he very early manifested a decided inclination for the art of design, they placed him, at the age of fourteen, under William Cornelis, an indifferent painter, with whom he remained three years, and made much greater progress than might have been expected. He afterwards studied under James Cornelis at Amsterdam, a much abler artist, who took great pains to instruct him. The fame of John de Mabuse, who was living in high esteem at Utrecht, induced Schorel to place himself under him; but he soon left him, on account of his dissolute manners, which disgusted the young artist. Schorel then travelled through Germany, and passed some time at Nürnberg with Albert Dürer, who treated him with great kindness. He next went to Venice, where he met with an ecclesiastic, his countryman, who persuaded him to join a company of pilgrims to the Holy Land. In Palestine he made numerous sketches of Jerusalem and the environs of the country about Jordan, and whatever appeared worthy of his attention. On his way to the Holy Land he landed at Cyprus; and on his return, at Rhodes, where he was received with much distinction by Villiers, the grand-master of the knights of St. John. In these islands he likewise enriched his portfolio with numerous sketches, which were of great use to him in his future compositions. On returning to Europe he passed three years at Rome, studying the works of Raffaele and other great masters and the antique. He was the first of the artists of the Netherlands who introduced the Italian taste into his own country. He settled at Utrecht. His works were very numerous, and are spoken of in the highest terms of praise: among them the Baptism of Christ, Christ's Entry into Jerusalem, the Passage of the Israelites over Jordan, and some others, are particularly mentioned. Unfortunately all his great works in the churches and convents were destroyed by the Iconoclasts, in 1566, only four years after his death. Though many in private collections escaped destruction, his works are now excessively scarce. In the collection of old paintings made by Messrs. Boissérée, now in the possession of the king of Bavaria, are four of his pictures; and in Lord Methuen's gallery at Corsham House there is one, of which Dr. Waagen speaks in very high terms of praise. Schorel, who, besides his eminence as a painter, was one of the most accomplished men of his time, died at Utrecht, in 1562, in the sixty-eighth year of his age.

SCHOTT, ANDREW, was born on the 12th of September, 1552, at Antwerp. He studied at Louvain, where he afterwards taught rhetoric. But the disturbances in the Netherlands obliged him to withdraw; and about 1577 he went to Paris, where for some time he assisted Busbecq in his literary occupations. After a stay of two years in France he went to Spain, where he became acquainted with some persons of influence at the court of Philip II., in consequence of which he obtained a professorship of Greek literature at Toledo. Schott gained so high a reputation, that in 1584 he was invited to the professorship of Greek and rhetoric in the university of Saragossa. In 1586 he entered the order of the Jesuits, and in consequence of this began the study of theology, which he subsequently taught at Saragossa, until he was invited to Rome as professor of rhetoric in the college of the Jesuits. Here he remained for three years, and at the close of this period he asked and obtained permission to return to Antwerp. The remainder of his life he spent at Antwerp, devoting himself entirely to literary pursuits. He died on the 23d of January, 1629.

Schott was a man of great industry and sincerity: he was kind and obliging to all persons, whether Romanist or Protestant, his only object being to advance the interests of learning and science. As a scholar he is more remarkable for his great and accurate learning than for his genius or critical talents. His works amounted to the number of forty-seven: we shall only give a list of the more important among them. 'Laudatio Funeris Ant. Augusti Archiep. Tarraconensis, in qua ejus Vita Scriptisque disseritur,' Leyden, 4to., 1586; 'Vitæ Comparatæ Aristotelis ac Demosthenis, Olympiadibus ac Prætoris Atheni-

ensium digestæ,' Augsburg, 4to., 1603; 'Hispania Illustrata, seu rerum urbiumque Hispaniæ, Lusitaniæ, Æthiopici et Indiæ Scriptores varii,' Frankfurt, 4 vols. fol., 1603, 1618: the first two vols. of this very important work were edited by Schott himself, the third by his brother, and the fourth by Pistorius. 'Thesaurus Exemplorum ac Sententiarum ex Auctoribus Optimis collectus, in centurias quatuor divisus,' Antwerp, 8vo., 1607; 'Hispania Bibliotheca, seu de Academiis et Bibliothecis, item Elogia et Nomenclator Clarorum Hispaniæ Scriptorum, qui Latine Disciplinas omnes illustrarunt,' Frankfurt, 4to., 1608: this work, though of great value for the literary history of Spain, has many defects; and as the author's name does not appear on the title-page, it has been thought that the work was not written by Schott himself. 'Adagia, sive Proverbia Græcorum ex Zenobio, Diogeniano, et Suidæ collectanea partim edita, partim nunc primum Latine reddita; accedunt Proverbiorum Græcorum e Vaticana Bibliotheca Appendix et Jos. Scaligeri Stromateus,' Antwerp, 1612, 4to.; 'Observationum Humanarum Libri Quinque quibus Græci Latiniqque Scriptores emendantur et illustrantur,' &c., Hanau, 4to., 1615; 'Tabulæ Rei Nummaria Romanorum Græcorumque ad Belgicam, Gallicam, &c. monetam revocatæ, cum brevi Catalogo eorum qui apud Græcos Latinosque de Ponderibus, Mensuris et Re Nummaria scripserunt,' Antwerp, 8vo., 1616; 'Selecta Variorum Commentaria in Orationes Ciceronis,' Cologne, 3 vols. 8vo., 1621. Schott also took a part in the edition of the 'Bibliotheca Patrum,' which appeared at Cologne in 1618, &c. He also published editions of several ancient writers, such as Aurelius Victor, Pomp. Mela, Orosius, St. Basilus, Theophylactes, and wrote notes upon Valerius Flaccus and Corn. Nepos. He also edited, with additions, the 'Annales Romani' of Pighius, the 'Itinerary' of Antoninus, Goltzius's 'History of Sicily,' Rosini's 'Antiquitates Romanæ,' and the 'Lettres' of Paul Manutius.

\*SCHOUW, JOACHIM FRIEDRICH, professor of botany and superintendent of the botanic gardens at Copenhagen. He was born at Copenhagen in 1789. He entered the university in the year 1808 and commenced the study of the law, but natural science having more attractions he gave himself up to the study of botany. In 1812 he made a natural history tour through Norway, and in 1816 he published an essay entitled 'De sedibus plantarum originariis,' for which he was honoured with the degree of Doctor of Philosophy. He afterwards travelled throughout Europe in search of botanical information, and in 1822 commenced publishing his 'Elements of a Universal Geography of Plants,' which was accompanied by an atlas. In 1835 he was elected to represent the University of Copenhagen in the Danish States' Assembly, and was for three successive years president of that body. He was remarkable for his liberal opinions, and especially for his advocacy of the freedom of the press. In 1844 he was chosen spokesman of the deputation who presented a petition to the king, praying for equal rights in the dukedom of Schleswig. Besides the botanical works above, Dr. Schouw has published many others on the distribution of plants, and the relations of climate to natural history productions. One of them entitled 'Earth, Plants, and Man,' has been translated into English by Professor Henfrey. Dr. Schouw is undoubtedly one of the greatest authorities on the subject of the distribution of plants, and his views on the subject of their relations are everywhere adopted as the basis of modern researches on this subject.

SCHREVELIUS, CORNELIUS, was born at Haarlem in South Holland, about the year 1615. He was brought up as a physician, but it is not stated if he ever practised this profession, and he is only known by his literary labours. In 1662 he succeeded his father as rector of a school at Leyden, which place he held till his death in 1664, according to so some, or in 1667 according to others. Schrevelius published editions of many of the Latin classical writers with notes collected from various critics; Juvenal, Persius, Terence, Virgil, Horace, and Cicero are among the number. He also published a Hesiod and Homer in the same way. He also edited the 'Lexicon' of Scapula, and that of Hesychius, which bears date the year 1663, after the death of Schrevelius, as appears from the dedication of the printer. Schrevelius is best known by his 'Lexicon Manuale Græco-Latinum,' the fourth edition of which is said to have appeared in 1645. Works of this kind should be estimated by the period to which they belong, and in this view the 'Lexicon Manuale' had the merit of furnishing the young scholar with a cheap dictionary of the Greek language. This dictionary however is of very limited use, as it is only applicable to a few authors. Perhaps few school-books have been more extensively used; the editions both English and foreign are innumerable: but it is formed on a plan fundamentally bad, and is full of errors of all kinds.

SCHUBERT, FRANZ, a German composer, of whose biography very little is known. He was born in the year 1807, and died in or about the year 1832, at the age of twenty-five. He composed several operas, symphonies, and other works of magnitude; but they never attracted much notice, and his short life appears to have been spent in neglect and obscurity. His large works are forgotten; but he has gained a great amount of posthumous fame by his songs and ballads, many of which are extant, and generally admired, not only in Germany, but in Italy, France, England, America, and indeed throughout the whole musical world; and they deserve their reputation, for, while their simple, natural, and expressive melody delights the popular

ear, the most accomplished musician is charmed by their masterly construction and inexhaustible richness of fancy. But the songs which pass under Schubert's name are very unequal in merit, and it is believed that many of them are not his composition, but spurious imitations of his style.

\*SCHUBERT, GOTTHILF HEINRICH VON, Professor of Natural History in the University of Munich, was born April 26, 1780, at Hohenstein in Saxony, where his father was minister. He received his early education at Greiz and Weimar, and whilst at Weimar attracted the notice of Herder, who received him into his house. He commenced the study of theology in the University of Leipzig, but a year after he left for Jena, where he devoted himself to the study of medicine. He commenced practice as a physician in Altenberg, and met with considerable success; but he was fond of literature, and this led him to the study of natural history. In 1804 he published a romance entitled 'Die Kirche und die Götter.' After remaining two years in Altenberg, he went to Freiburg, in order to study geology. In 1807 he repaired to Dresden to study the art-treasures of that city; here he delivered lectures on natural science, which he afterwards published, under the title of 'Views of the Night-side of Nature:' he had already published one volume of his great work on the 'Universal History of Life,' which was completed in 1820. In 1809 he accepted the position of tutor to the children of the Grand-Duke of Mecklenburg-Schwerin. On resigning this appointment he became professor of natural history in the University of Erlangen, and subsequently accepted the same chair at Munich.

Schubert has published a great many works, all of them partaking more or less of a metaphysical character. Some of his writings are devoted to religious subjects, and are treated of in a pietistic and mystical manner. He has written several volumes giving an account of his travels; such are his 'Journeys in the East,' 'Travels in the South of France and Italy,' and others.

SCHULTENS, ALBERT, a learned divine, was born at Groningen in 1680. He studied at that place till 1706, and made rapid progress in theology, Hebrew, Syriac, and Arabic. He then visited Leyden, and attended the lectures of the most eminent professors at that university. Thence he passed to Utrecht, where he met Reland, and profited by his lessons. On his return to Groningen in 1708 Schultens took holy orders, and in 1711 became curate of Wassenaar. Two years after he was appointed professor of the Oriental languages at Franeker, where he remained till 1720. He was then invited to Leyden, where he taught Hebrew and the Oriental languages with great reputation till his death, which happened on the 26th of January 1750, in the sixty-fourth year of his age. He left a son, named John Jacob, who was professor of divinity at Herborn, and who afterwards succeeded him in the chair of Oriental languages at Leyden. Schultens published several works on various subjects connected with Biblical or Oriental literature. The principal are:—*Commentarius in Librum Job, cum novâ versione*, 2 vols. 4to, Leyden, 1737; '*Vetus et regia via Hebraizandi contra novam et metaphysicam hodiernam*,' 4to, Leyden, 1738; '*Origines Hebraeae*,' 2 vols. 4to, Franeker, 1724-38. In these last two works Schultens upholds the doctrine that the Hebrew, Arabic, Syriac, and Chaldaee are only the remains of a more ancient language taught to man by his Creator; and refutes the opinions of Goussset and his disciples, who maintained the divine origin of the Hebrew. '*Proverbia Salomonis cum versione integrâ et commentario*,' 4to, Leyden, 1748; '*Monumenta vetustiora Arabica*,' 4to, Leyden, 1740, or a collection of poetical fragments of the times preceding Mohammed, as preserved in the works of Nuwayrî, Masûdî, Abû-l-fedâ, &c., with a Latin translation and copious notes. He published also the '*Life of Saladin*,' by Bohâd-d-din, in the original Arabic, with a Latin translation, and an excellent geographical index, folio, Leyden, 1755; a portion of the '*Makamat*,' or sessions of Harîrî; and a new edition of Erpenius's Arabic Grammar, with numerous additions. A short account of the life and writings of Schultens may be read in the '*Athenae Frisiae*,' by Vriemoot.

SCHULTENS, HENRY ALBERT, grandson of the preceding, was born at Herborn, February 15, 1749, at the time when his father (John Jacob) was professor of divinity at that place. He was educated at Leyden, where he applied himself with great diligence to the study of Hebrew and Arabic under his father and Everard Scheid, who then lodged at his house. He also studied the Greek and Latin classics under Hemsterhuis, Rhunkenius, and Walkenaar; and cultivated English literature, being remarkably fond of Pope, and an enthusiastic admirer of Shakspeare. In 1722, when he was only in his twenty-third year, he published his '*Anthologia Sententiarum Arabicarum*' (4to, Leyden), with a Latin translation and notes. Shortly after he visited England, for the purpose of consulting the Arabic manuscripts in the Bodleian Library, and resided for some time at Oxford as a gentleman-commoner of Wadham College. In May 1773 the university conferred on him the degree of M.A. by diploma. He also visited Cambridge, and made several corrections and additions to the catalogue of the Oriental manuscripts in the university library. During his stay in England, Schultens published his '*Specimen Proverbiorum Meidani ex versione Pocockiana*' (4to, 1773), which he had transcribed while at Oxford from the original manuscript of Edward Pocock, preserved in the Bodleian. On his return to Holland, Schultens was appointed professor of Oriental languages in the academical school of Amsterdam

where he remained for five years, until in December 1778 he was called to succeed his father in his chair, and in 1787 was elected rector of the university. At the expiration of his functions in 1788 he delivered his remarkable peroration, '*De Ingenio Arabum*,' which was afterwards printed. In November 1792 he was attacked by a slow fever that terminated in a consumption, of which he died in August 1793, at the age of forty-four.

Besides his '*Anthologia*' of Arabic sentences, and several articles in the '*Bibliotheca Critica*,' edited by Wytenbach (Amst., 1779-90), Professor Schultens wrote '*Pars versionis Arabice Libri Colalah wa Dimnah*,' 4to, Leyden, 1786, or the Arabic translation of the Fables of Bidpay, or Pilpay, made by Abdalla Ibn Mokaffia. [PILPAY.] '*Meidani Proverbiorum Arabicorum pars, Latine cum notis*,' 4to, Leyden, 1795. This work, which is different from that published in 1773, was not printed till after the death of the author, by the care of his friend Nicholas William Schröder. It contains only a portion of the proverbs of Mejdani, of the whole of which Schultens had made a translation. '*De Finibus Litterarum Orientalium Proferendis*,' 4to, Amst., 1774. '*De Studio Belgarum in Litteris Arabicis Excolendis*,' Leyden, 1779. These are two inaugural orations read on the occasion of his taking possession of the chairs which he filled at Amsterdam and Leyden. He left also a Dutch translation of the Book of Job, which has never been printed. The life of Henry Albert Schultens, accompanied by his portrait, appeared in Wagenaar's collection, entitled '*Series Continuata Historiæ Batavæ*,' part i., pp. 364-380.

SCHULTING, ANTONIUS, was born at Nymegen in Guelderland, in 1659. He received a learned education under Ryequius and Grævius, and afterwards studied law at Leyden under Voet and under Noodt to whom he was related. After being employed as a teacher of law in his native province and also in Friesland, he was removed to the University of Leyden in 1713, where he became the colleague of Noodt. He died at Leyden in 1734. Schulting was a laborious student, and he had a right perception of the necessity of studying Roman law in its historical development. Besides some orations delivered on public occasions, he wrote '*Enarratio partis primæ Digestorum*,' Leyden, 8vo, 1720; '*Thesium Controversarum juxta seriem Digestorum decades C.*,' Leyden, 8vo, 1738; and '*Notæ ad Veteres Glossas Verborum Juris in Basilicis*,' inserted in the third volume of the Thesaurus of Otto. But the work by which he is best known is the '*Jurisprudentia Vetus ante-Justiniana*' (Lugd. Bat., 1717 and Lips., 1737), which contains the remains of the four books of the '*Institutiones*' of Gaius, the '*Sententiæ Receptæ*' of Paulus, the twenty-nine '*Tituli ex Corpore Ulpiani*,' the fragments of the '*Codices Gregorianus et Hermogenianus*,' the '*Mosaicarum et Romanarum Legum Collatio*,' and some few other matters. Though this work has been superseded either altogether or in part, so far as regards the text, by the '*Jus Civile ante-Justinianum*,' &c., published at Berlin in 1815, by the '*Corpus Jur. Rom. ante-Justinian.*,' &c., Bonn, 1835 and 1837, and by the various discoveries and labours of more recent jurists, it is still very valuable for the learned notes of Schulting and other scholars which accompany it.

\*SCHULTZ, KARL HEINRICH, or as he is now called SCHULTZ SCHULTZENSTEIN, professor of medicine in the University of Berlin. He was born at Alt-Ruppin on the 8th of July, 1798. He was educated at the Gymnasium of Neu-Ruppin. He studied medicine and surgery at Berlin and graduated as Doctor of Medicine in 1821. In 1822 he became a private teacher in the university, and in 1825 he was made an extraordinary professor, and in 1825 an ordinary professor. He is distinguished for his researches in vegetable physiology more especially for the discovery of the laticiferous tissues in plants and the circulation of a fluid in them. His papers on this subject are very numerous, although recent botanists have been led to doubt the correctness of many of his conclusions. He has also written upon the nature of the blood and its changes and composition in disease. In his work entitled '*The Universal Doctrine of Disease*' he has explained many of his peculiar views. He has written a work on homoeopathy, in which he endeavours to show that this system is but the revival of the doctrine of Paracelsus. He has written also many other works on physiology and medicine.

SCHULTZE, ERNST CONRAD FRIEDRICH, a young German poet, no less remarkable for the enthusiasm of his character, and for the peculiar application of his genius, than for his genius itself. He was born at Celle, March 22nd 1789, and was so far from giving early indications of a studious disposition, that while at school he was considered exceedingly negligent and wayward, and impatient of restraint or order. Neither did he distinguish himself by diligence at the University of Göttingen, whither he proceeded in 1806; for though he gained the notice and friendship of Professor Bouterwek, by the superiority of his college exercises, and by the talent displayed in the poetical compositions he ventured to submit to his criticism, he benefited little by the public lectures he attended, even those on classical and modern literature. A year or two before going to the university he had indulged in reading romances of chivalry and legends of fairy fiction, of which he had met with an ample store in an old library to which he had access, and their influence is plainly perceptible in his productions. The first was a poem, composed by him while at Göttingen, on the story of Psyche, in which he seems to have proposed to himself

Wieland as his model, and in which he caught the charming style and versification of that master.

Had he prosecuted the career thus begun at the age of eighteen, he would probably have become one of the most popular as well as the most gifted of German poets. Circumstances however converted him into a visionary enthusiast. He conceived a deep attachment for an amiable and accomplished girl, named Cecilia, the daughter of one of the professors; and her death, within a year or two afterwards, left him inconsolable. He resolved to immortalise his passion and her name and perfections: accordingly, with only an interval during which he served as a volunteer in the war of 1813-14, he applied himself to the composition of 'Cecilia,' a romantic poem in twenty cantos, completed by him in December 1815. Unfortunately the intensity of his own feelings overpowered his judgment; for the plan of the work is so complex, and so wild and improbable, that the fancy and genius displayed in it have been wasted upon a subject which scarcely any poetical power could invest with interest for the public. It is rich in striking scenes and incidents, in beautiful details, in graceful imagery, in harmonious versification; but it is wanting in that which fixes attention, and which is especially required in a work of such length. It is impossible not to admire the talent which it displays, and it is equally impossible not to regret that it should have been so ill applied.

His subsequent romantic poem, 'Die Bezauberte Rose,' or 'Enchanted Rose,' in three cantos, in regular ottava rima, which obtained the prize offered by the publishers of the 'Urania' for the best production of the kind, and first published in that pocket-book, 1818, is the production by which he will continue to be known. It has passed through several editions, and may now be considered a standard work of its class in German literature. The poet himself however did not live to enjoy the honour it conferred upon his name; for after having been long in a gradually declining state, he died at his father's house at Celle, June 22nd 1817, the victim of consumption, but also of morbid and overstrained feeling. A collection of his poems and literary remains was published by his friend and instructor Bouterwek, in 4 vols. 8vo.

SCHUMACHER, HEINRICH CHRISTIAN, was born on September 3, 1780, at Bramstedt in Holstein. He distinguished himself by his mathematical proficiency and by his predilection for astronomy. At the age of thirty he was created professor-extraordinary of astronomy in the University of Copenhagen, whence he was called in 1813 to be director of the observatory at Mannheim, returning to Copenhagen in 1815 as professor of astronomy and director of the observatory there. In 1817 he was employed by the Danish government to measure the degrees of longitude from Copenhagen to the west coast of Jutland, and those of latitude from Skagen, the northern cape of Jutland, to Lauenburg, on the frontiers of Hanover; afterwards continued through Hanover by Gauss. In 1821 he received from the Royal Scientific Society of Copenhagen the direction of the survey and mapping of Holstein and Lauenburg; and in that year the king caused a small but excellently furnished observatory to be built for him at Altona, where he resided till his death. In 1824, in conjunction with the English Board of Longitude, he fixed the measure of differences between the observatories of Greenwich and Altona, for which purpose the English admiralty furnished a steam-vessel, provided with twenty-eight English and eight Danish chronometers. In 1830 he was employed in ascertaining the length of the seconds' pendulum, which had been made the base of the Danish scale of measures. In 1813 he commenced the publication of the 'Astronomische Nachrichten,' a work that is still continued, and is the only one that serves as a vehicle for the communication of opinions and facts from the astronomers of all the world, and contains a number of highly valuable essays. From 1820 to 1829 he published his 'Astronomische Hilfstafeln,' a good example of a carefully calculated ephemeris. In 1836 in conjunction with Bessel he undertook the editing of the 'Astronomischen Jahrbuchs.' He was a diligent and correct observer; in 1822 he announced the exact distances of Venus, Jupiter, Mars, and Saturn from the earth; and the phenomena connected with Encke's planet Astræa attracted much of his attention in the latter part of his life. He died at Altona on December 28, 1850. Schumacher united great talents with much modesty; he enjoyed the confidence of his sovereign, which he repaid by his diligent services, and he uniformly treated his fellow labourers with the greatest courtesy, and imparted his assistance with unostentatious liberality.

SCHUMANN, ROBERT, a composer who has a great reputation in Germany, but whose works are little known in this country. He was born about the year 1815, and spent a retired and uneventful life, chiefly at Leipzig, immersed in the study and practice of his art. His excessive application disordered his mind; and when he died, July 29, 1856, he had been several years the inmate of a lunatic asylum. He married Clara Wieck, the most celebrated female pianist of the day, who, with several children, survives him. Schumann was undoubtedly a man of great genius; but he has injured his reputation with his contemporaries by his endeavours to found a musical school, or sect, professing to disregard the authority of the older masters, and to establish a new system of musical composition. As music has always been in a progressive state, posterity may perhaps do him justice by adopting his innovations of style. His only work of mag-

nitude which has been publicly performed in England is a cantata, 'Paradise and the Peri,' the words of which are a translation of Moore's poem. It was produced at one of the Philharmonic Society's concerts last season, when the principal part was sung by Madame Goldschmidt (Jenny Lind), and, though our critics were at variance respecting its merits, yet it was generally regarded as a work of no ordinary power and beauty.

SCHWANTHALER, LUDWIG MICHAEL, one of the most eminent of modern German sculptors, was born at Munich on the 26th of August 1802. For some generations his ancestors had been sculptors in the Tyrol; his father, Franz Schwanthaler, was settled in Munich, where he acquired a very respectable standing as a monumental sculptor. Ludwig received a good classical and general education; and being intended to pursue the family calling was early initiated into the arts of drawing and modelling, and the use of the chisel in his father's studio. At the Munich Academy of the Fine Arts he was regarded with coldness if not dislike on account of his free notions in art by Von Langer the director, who is said to have urged his friends to devote him to some other profession. The death of his father in 1821, by rendering it necessary that he should conduct the business for the maintenance of the family, fixed his destiny as a sculptor. The first commission which opened to him a prospect of making himself known was one from the King Maximilian Joseph in 1824, to design a centre ornament in silver for the table. It was to be of very large size, and the figures in relief, each about six inches in height, were to represent the procession of the gods of Olympus to the palace of Jupiter. So much as was executed is described as being very beautiful, but the death of Maximilian (October 1825) prevented its completion.

Schwanthaler now proceeded to Rome, where he remained a year, deriving great benefit from the advice and friendship of Thorwaldsen. He carried back with him to Munich two elegant bassi-rilievi of the 'Birth of Venus' and 'Cupid and Psyche,' and through the influence of Cornelius he was employed to execute two extensive Homeric bassi-rilievi friezes for the Glyptothek, then in course of construction. Among other works which about this time he produced were a statue of Shakspeare for the theatre, and a grand basso-rilievo frieze, extending in all to a length of 150 feet, of the 'Apotheosis of Bacchus' for the dining-room of the palace of Duke Maximilian. In 1832 he again went by desire of King Ludwig to Rome, to complete Rauch's design for the south pediment of the Walhalla as well as to execute various other royal commissions for the new palace.

From the period of his return in 1833 his life was one of unceasing activity. The admitted head of the sculptors of Munich, the professor of sculpture (from 1835) in the Academy there, and the favourite of the art-loving King Ludwig, whose constant guide and assistant he was in planning and working-out the sculptural decorations of his vast architectural undertakings, Schwanthaler produced in rapid succession an astonishing number of works of unusual magnitude and grandeur, and was the centre of a crowd of able and devoted scholars and assistants. During the few remaining years of his life, all spent in ill-health, he executed a succession of great works, such as would seem more than enough to have tasked the energy and industry of the most indefatigable and laborious workman whose days had been extended to the longest span, and who had been blessed with the most robust health.

We can name but some of his more prominent works. The southern pediment of the Walhalla at Ratisbon, filled with a design intended to typify the liberation of Germany from the French, was only in part by him; but the design in the northern pediment, a later work, was wholly by himself, and was of a much higher order of merit. It is called the 'Hermann-Schlacht,' or 'Battle of Arminius,' and is one of the finest renderings of old Teutonic story which has ever been realised by the sculptor's chisel. He also executed some of the statues in the Walhalla, and the fourteen caryatides representing the Walkyres of the Teutonic mythology. For Ludwig's New Palace (Neue Königsbau), Schwanthaler not only executed several friezes and statues, but made the cartoons for numerous pictures which were painted in encaustic by Hiltensperger, Streidel, and others. Among these are a series of twenty-four compositions from Æschylus, twenty-one from Sophocles, twenty-seven from Aristophanes, a series from the tales of the Argonauts, another from the 'Works and Days' and the 'Shield of Hercules' of Hesiod. His most famous piece of sculpture here is however the 'Myth of Aphrodite,' but the story of Venus was never more coldly told. For the Fest-Saalbau he designed the two lions, and the eight figures representing the eight circles of Bavaria, on the entablature; the frieze in relief of the 'Crusade of Barbarossa' ('Der Kreuzzug des Kaisers Friedrich Barbarossa'), placed above the paintings by Schnorr [SCHNORR, JULIUS VON KARLSFELD], one of his best works; the bassi-rilievi of Greek Dancers in the Ball-Room; and the twelve colossal gilt bronze statues of the princes of the House of Wittelsbach, in the Throne-Room, &c. For the façade of the Pinakothek he executed statues of twenty-five of the greatest painters. For the pediment of the New-Art Exhibition Gallery (Neue Kunstanstaltungs-Gebäude) he executed a representation of the Arts placing themselves under the protection of Bavaria. For the magnificent Ludwigs Kirche he modelled statues of Christ and the four Evangelists, which are placed in a row of niches over the porch, and for the ends of the gable two

colossal statues of St. Peter and St. Paul. There are also by him in Munich statues, some of them of colossal size, and most of them in bronze, of Count Tilly, Field-Marshal Prince Wrede, Kreitmayer, the author of the Bavarian code, and one or two others. But the chief work with which he adorned his native city was his immense statue of Bavaria, which occupies the centre of the Bavarian Hall of Fame (Bairische Ruhmershalle). Bavaria is represented as a maiden crowned with the oak-garland; one hand is stretched out, and holds a laurel crown, the reward of merit; the other presses a sword against her bosom, to defend her independence; by her side reclines a lion. The group, which is of bronze, exceeds in magnitude any other modern work. The figure of Bavaria is about 60 feet high, that of the lion is nearly 30 feet; the pedestal is 28 feet high: a staircase inside leads up to the head of Bavaria, which is large enough to contain several persons. This vast work was commenced in 1844, but neither the sculptor nor the founder of this unparalleled work [STIGLMAYER, JOHANN BAPTIST], lived to see it placed on its pedestal. It was inaugurated with great ceremony, October 9, 1850. Remarkable as this work is for its size, it is equally so for its grandeur. It was the crowning work of Schwanthaler's life, and as long as it endures it will be the most impressive monument to his genius. The Ruhmershalle however contains other proofs of his versatile imagination. In the tympana at the end of the wings of the building are four recumbent figures by him, representing the four national divisions of the kingdom, Bavaria, the Palatinate, Swabia, and Franconia; and the frieze contains 92 metopes, all of them designed by him: 44 containing figures of Victory, and the remaining 48 the arts and occupations of civilised life.

Among important public works which he designed for other places may be mentioned, his grand fountain in the Neumarkt, Vienna, around the basin of which he has placed figures typifying the Enns, Ips, Traun, and March, the four principal rivers of the archduchy of Austria, pouring their waters into the Danube, which is represented by a colossal figure in the centre; another and finer fountain in the Freieung, Vienna, in which are five beautifully-designed bronze figures of Austria with her four great rivers, the Danube, Vistula, Elbe, and Po; the monument of Carl Friedrich, grand-duke of Baden, with its four allegorical figures, at Karlsruhe; monumental statues of the Emperor Rudolf von Habsburg at Spire, King Charles John of Sweden, the Grand-Duke Ludwig at Darmstadt, Mozart at Salzburg, Göthe at Frankfurt, Jean Paul Richter at Baireuth, and many more, one of the more remarkable being a series of twenty statues of eminent Bohemians for a national monument at Liborich, near Prague, which however he left unfinished. Among the works executed for private patrons we can only name his statues of Venus, Apollo, Cupid, Diana, Vesta, Ceres, Bacchus, Pan, various nymphs, and the like, from the Grecian mythology; statues and statuettes of knights and old Teutonic heroes; and a vast number of sepulchral and portrait statues, busts, and medallions, which are to be found not merely in the princely galleries and churches of Bavaria and Austria, but scattered throughout Germany, and occasionally in England.

Ludwig Schwanthaler died—his feeble frame, it is said, literally worn out by his unceasing labour—on the 17th of November 1848, having only a few months before completed his forty-sixth year. The above very incomplete enumeration of his works will more than suffice to show the wonderful energy and industry of the man; but it is necessary to examine the works themselves to form a just estimate of his various and apparently inexhaustible genius. It will not of course be supposed however that he accomplished the impossible task of carving all these works with his own chisel. From the establishment of his studio at Munich he had about him a large body of pupils, some of whom have since come to be among the more eminent of living German sculptors, and to them was in most instances entrusted the duty of carrying out the designs of the master. But Schwanthaler himself was a rapid, often an impatient designer, and hence, the imperfect design being left to be completed by insufficiently-experienced assistants, it often happens in his less important works that there is an absence of finish, an appearance of carelessness even, which is disappointing to the spectator and injurious to the reputation of the sculptor. Schwanthaler's strength is seen in his realisation of old Teutonic fable and history, like his Hermann-Schlacht, or those types of German ideas, such as he has so grandly presented in his 'Bavaria.' Among the Grecian deities he falls into the old conventionalisms, or Germanises the Hellenic thought.

By his will Schwanthaler bequeathed to the Munich Academy of the Fine Arts his studio, with models of all the principal works executed by him. The studio stands opposite to the house in which he died, in the street named in honour of him, the Schwanthalerstrasse, and in it is carefully preserved the extensive collection of his works. It is open daily to the public, and is one of the great art-sights of the German metropolis of art. The Crystal Palace at Sydenham contains casts of the head of the colossal 'Bavaria,' the 'Shield of Hercules,' and several other of Schwanthaler's productions.

SCHWARZ, CHRISTIAN FRIEDRICH, was born October 26, 1726, at Sonnenburg, in the Prussian province of Brandenburg. He was educated at the schools of Sonnenburg and Cüstrin till his twentieth year, when he entered the University of Halle, where he obtained the friendship of Herman Francke, who was a warm supporter of missionary labours. Schwarz and another student were appointed

to learn the Tamul, in order to superintend the printing of a Bible in that language, which however was not carried into effect; but the knowledge of the Tamul which Schwarz had acquired induced Francke to propose to him that he should go out to India as a missionary. Schwarz had been educated with a view to the Christian ministry: his own religious impressions had early seconded the wishes of his father, and the proposal of Francke was immediately acceded to. Having been ordained at Copenhagen, he embarked at London, January 21, 1750, and in July arrived at Tranquebar, on the Coromandel Coast, the appointed scene of his labours, and the seat of a Danish mission.

Schwarz continued to reside chiefly at Tranquebar, and to labour with the Danish mission till 1766, when he devoted his services to the Society for Promoting Christian Knowledge, to which the Danish mission was soon afterwards transferred. He now took up his abode at Trichinopoly, where he had founded a church and school in 1765. Here he performed the duties of chaplain to the garrison, for which he received 100*l.* a year, a sum which he devoted entirely to the service of the mission.

Schwarz continued to reside for several years at Trichinopoly, occasionally visiting other places, especially Tanjore. Small congregations of Hindoo converts gradually grew up under his care, and in 1777 another missionary was sent from Tranquebar to assist him. His visits to Tanjore now became more frequent, and he obtained the friendship of the raja Tulia Maha, who gave him leave to build a church in Tanjore. He proceeded with the work till his funds were exhausted, when he applied to the presidency of Madras for assistance. In reply he was requested to proceed immediately to the seat of government in order to receive the appointment of ambassador, for the purpose of treating with Hyder Ali for the continuance of peace, a task for which he was summoned by Hyder himself. "Do not send to me," said Hyder, "any of your agents, for I do not trust their words or treaties; but if you wish me to listen to your proposals, send to me the missionary of whose character I hear so much from every one: him I will receive and trust." Schwarz was startled by the novelty of the proposal, but after requesting time to consider of it, he accepted the offer. He proceeded to Seringapatam, and resided at the court of Hyder for three months. His mission was entirely successful; the terms of peace were settled, and he then returned to Tanjore.

The peace however was of short continuance, and Schwarz complained that the British were guilty of the infraction. Hyder invaded the Carnatic, and during the years 1781, 1782, and 1783 the sufferings of the inhabitants were dreadful; they fled to the towns for protection; Tanjore and Trichinopoly were crowded with starving multitudes; at Tanjore especially numbers died in the streets of famine and disease, and the garrison itself was enfeebled by want, and dispirited by knowing that a powerful army was outside the walls. There were provisions in the country, but the exactions both of the British and the Raja had destroyed the confidence of the cultivators, and they would not bring them to the fort. At length the Raja said, "We have lost all our credit. Let us try whether the inhabitants will trust Mr. Schwarz." Schwarz was accordingly empowered to treat with the cultivators. He sent out letters, in which he promised not only to pay for what was brought in, but for any bullock which might be taken by the enemy. In two or three days a thousand bullocks were obtained, and in a short time 80,000 *kalam*s of grain. By this means the town was saved.

In 1784 the East India government sent Schwarz on a mission to Tippoo Saib, but the son of Hyder would not receive him. Another church was built in the neighbourhood of Tanjore, which the increase of his congregation had rendered necessary; and in 1785 he engaged in a scheme for the establishment of schools throughout the country for the purpose of teaching the natives the English language, which was carried into effect at Tanjore and other places; and the good faith and good sense with which Schwarz conducted them, no 'deceitful methods' being used to bring over the pupils, who were chiefly children of the upper classes, to the doctrines of Christ, proved highly beneficial, not only from the instruction and moral principles communicated, but from the confidence and good feeling which were created in the natives generally.

In 1787 the Raja of Tanjore lay at the point of death. He had adopted as his successor a boy yet in his minority, and now sent for his friend Schwarz as the only person to whom he could with confidence entrust him. "He is not my son, but yours," said the dying Raja; "into your hands I deliver him." Ameer Sing, brother of Tulia Maha, was appointed regent and guardian; but he was disposed to be treacherous, and he was supported by a strong British party; so that it required all Schwarz's care and influence with the East India Company to establish the young prince in the possession of his inheritance. Maha Sarbojee, the raja, some years afterwards manifested his filial affection for his tutor and protector by erecting a monument to his memory in the mission church at Tanjore, on which the Raja is represented as grasping the hand of the dying missionary, and receiving his blessing. The monument is by Flaxman. The success of Schwarz in the education of his pupil is shown by the terms in which Bishop Heber spoke of him (the Raja) in 1826. Heber calls him "an extraordinary man," and says that he quoted Fourcroy, Lavoisier, Linnaeus, and Buffon fluently, that he had formed an accurate judgment of the merits of Shakspeare, that he wrote tolerable

English poetry, and was "respected by the English officers in the neighbourhood as a real good judge of a horse, and a cool, bold, and deadly shot at a tiger." Heber sums up his description by remarking that "he looked and talked like a favourable specimen of a French general officer."

Schwarz died February 13, 1798. Besides the monument already mentioned, which the Raja sent a commission to Flaxman to execute, another by Bacon was sent out by the East India Directors, and was erected in St. Mary's church at Madras.

For several years Schwarz's labours in the conversion of the Hindoos were apparently attended with little success, which was not owing to persecution or opposition, but almost entirely to the peculiar mental character of the natives of India, cool, subtle, fond of argument, and slow to be convinced; but the effect of his preaching and the influence of his virtuous and disinterested life were attended by a slow but steady advance of the cause of Christianity. Congregations were formed in numerous villages, and preachers were established at Caddalore, Negapatam, and other towns, besides those at the earlier stations of Tranquebar, Trichinopoly, and Tanjore. The memory of Schwarz is regarded with a feeling of veneration both by Mohammedans and unconverted Hindoos, as well as by the Christian converts. Bishop Heber says of him ("Journey through the Upper Provinces of India"), that "he was one of the most active and fearless, as he was one of the most successful missionaries who have appeared since the Apostles. To say that he was disinterested in regard of money is nothing; he was perfectly careless of power, and renown never seemed to affect him, even so far as to induce an outward show of humility. His temper was perfectly simple, open, and cheerful, and in his political negotiations (employments which he never sought, but which fell in his way) he never pretended to impartiality, but acted as the avowed though certainly the successful and judicious agent of the orphan prince committed to his care."

SCHWARZENBERG, KARL PHILIP, PRINCE OF, Field-Marshal of the Austrian armies, was born at Vienna, April 15, 1771. During the war against the Turks, 1789, he gave proof of so much discipline and zeal, as to obtain for him the command of part of the vanguard of the Prince of Coburg, in the campaign of 1792. Soon after, on the 26th of April, 1794, at the combat of Chateau-Cambresis, he placed himself at the head of a cavalry regiment and a body of English troops, with which he cut his way through a corps of 27,000 French soldiers. For this exploit he was made a colonel; in 1797, he became a major-general.

In 1799, having raised a regiment of Hulus at his own cost, his own name, which it still bears, was given to it; the same year, he was appointed lieutenant-field-marshal. He was present at the dreadful defeat of Hohenlinden, so honourable to Moreau, but he saved his own corps. The battle of Austerlitz (December 2, 1805), was fought contrary to the advice of Schwarzenberg, who strongly urged the necessity of waiting for the arrival of Benningsen and the Archduke Charles.

Conformably with the wishes of the Emperor Alexander, Schwarzenberg was sent to the court of St. Petersburg, as ambassador, in 1808. He distinguished himself greatly at the battle of Wagram, in 1809, and during the retreat he commanded the rearguard. In 1810, he was appointed general of the Austrian cavalry. Whilst the preliminary measures were in progress for the marriage of Napoleon with the Archduchess Maria Louisa, he was selected to conduct the negotiations on the part of Austria. His government now became the ally of France, and having furnished an auxiliary force of 30,000 troops to sustain the expedition against Russia, in 1812, this general was placed at its head. The reluctance with which Schwarzenberg acted under the Emperor Napoleon was often complained of during this disastrous campaign, and is still the subject of censure in most of the French historians; but he is now generally understood to have submitted to private instructions from his own government. He was however created field-marshal for his services in this war, at the express desire of Napoleon. Shortly before the great battle of Leipzig, October 18, 1813, he was appointed commander-in-chief of the allied armies then confederated against France; and on that day beheld the fine army of Napoleon almost annihilated. In the campaign of 1814, he entered the French territory, and adopting a cautious system was often opposed to the active tactics of Prince Blücher, who proposed an immediate advance upon the capital. Nevertheless he consented at last to this decision on the 24th of March; after which he entered the city on the 31st, when Marmont had capitulated.

The remainder of his career passed away without any noticeable events, except the honours which the Emperor of Austria heaped upon him. He was made minister of war, received a grant of extensive lands in Hungary, and was allowed to engrave the Imperial arms of Austria on his family escutcheon. Having been thrown from his horse, he was attacked by apoplexy, which produced a fatal result, on the 15th of October, 1820.

SCINA, DOMENICO, was born at Palermo in 1765. He studied in his native town under Rosario Gregorio and other good masters, and became a proficient in classical erudition. He afterwards applied himself to the study of the mathematical and physical sciences, and to these the remainder of his life was chiefly devoted. In 1796 he was appointed professor of physics in the University of Palermo. He was repeatedly sent by the government to various parts of Sicily to explore
